| H8S/2424  | R4F2424  |
|           | R4S2424  |

All information contained in these materials, including products and product specifications, represents information on the product at the time of publication and is subject to change by Renesas Electronics Corp. without notice. Please review the latest information published by Renesas Electronics Corp. through various means, including the Renesas Electronics Corp. website (<http://www.renesas.com>).

#### Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
  2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
  3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
  4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
  5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
  6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
  7. Renesas Electronics products are classified according to the following three quality grades: "Standard", "High Quality", and "Specific". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as "Specific" without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as "Specific" or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is "Standard" unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.  
"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.  
"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.  
"Specific": Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
  8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
  9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
  10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
  11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
  12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.
- (Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.
- (Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

# General Precautions in the Handling of MPU/MCU Products

The following usage notes are applicable to all MPU/MCU products from Renesas. For detailed usage notes on the products covered by this manual, refer to the relevant sections of the manual. If the descriptions under General Precautions in the Handling of MPU/MCU Products and in the body of the manual differ from each other, the description in the body of the manual takes precedence.

## 1. Handling of Unused Pins

Handle unused pins in accord with the directions given under Handling of Unused Pins in the manual.

— The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions may occur due to the false recognition of the pin state as an input signal. Unused pins should be handled as described under Handling of Unused Pins in the manual.

## 2. Processing at Power-on

The state of the product is undefined at the moment when power is supplied.

— The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied.

In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed.

In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.

## 3. Prohibition of Access to Reserved Addresses

Access to reserved addresses is prohibited.

— The reserved addresses are provided for the possible future expansion of functions. Do not access these addresses; the correct operation of LSI is not guaranteed if they are accessed.

## 4. Clock Signals

After applying a reset, only release the reset line after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.

— When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.

## 5. Differences between Products

Before changing from one product to another, i.e. to one with a different part number, confirm that the change will not lead to problems.

— The characteristics of MPU/MCU in the same group but having different part numbers may differ because of the differences in internal memory capacity and layout pattern. When changing to products of different part numbers, implement a system-evaluation test for each of the products.

# How to Use This Manual

## 1. Purpose and Target Readers

This manual is designed to provide the user with an understanding of the hardware functions and electrical characteristics of the MCU. It is intended for users designing application systems incorporating the MCU. A basic knowledge of electric circuits, logical circuits, and MCUs is necessary in order to use this manual.

The manual comprises an overview of the product; descriptions of the CPU, system control functions, peripheral functions, and electrical characteristics; and usage notes.

Particular attention should be paid to the precautionary notes when using the manual. These notes occur within the body of the text, at the end of each section, and in the Usage Notes section.

The revision history summarizes the locations of revisions and additions. It does not list all revisions. Refer to the text of the manual for details.

The following documents apply to the H8S/2426, H8S/2426R, H8S/2424 Group. Make sure to refer to the latest versions of these documents. The newest versions of the documents listed may be obtained from the Renesas Electronics Web site.

| Document Type              | Contents  | Document Title   | Document No.       |

## 2. Description of Numbers and Symbols

Aspects of the notations for register names, bit names, numbers, and symbolic names in this manual are explained below.

### (1) Overall notation

In descriptions involving the names of bits and bit fields within this manual, the modules and registers to which the bits belong may be clarified by giving the names in the forms "module name"."register name"."bit name" or "register name"."bit name".

### (2) Register notation

The style "register name"\_"instance number" is used in cases where there is more than one instance of the same function or similar functions.

[Example] CMCSR\_0: Indicates the CMCSR register for the compare-match timer of channel 0.

### (3) Number notation

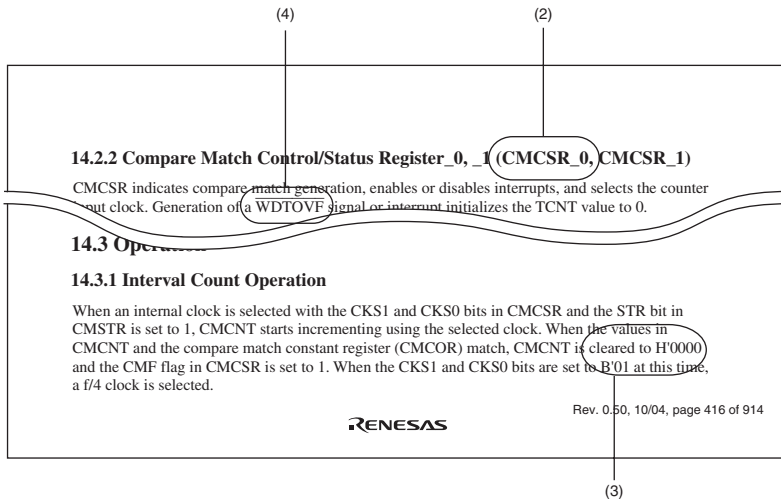

Binary numbers are given as B'hnnn (B' may be omitted if the number is obviously binary), hexadecimal numbers are given as H'hnnn or 0xnenn, and decimal numbers are given as nnnn.

[Examples] Binary: B'11 or 11  
Hexadecimal: H'EFA0 or 0xEFA0  
Decimal: 1234

### (4) Notation for active-low

An overbar on the name indicates that a signal or pin is active-low.

[Example]  $\overline{\text{WDTOVF}}$

Note: The bit names and sentences in the above figure are examples and have nothing to do with the contents of this manual.

### 3. Description of Registers

Each register description includes a bit chart, illustrating the arrangement of bits, and a table of bits, describing the meanings of the bit settings. The standard format and notation for bit charts and tables are described below.

[Table of Bits]

| (1)<br>Bit | (2)<br>Bit Name | (3)<br>Initial Value | (4)<br>R/W | (5)<br>Description                        |
|------------|-----------------|----------------------|------------|---|
| 15         | -               | 0                    | R          | Reserved                                  |
| 14         | -               | 0                    | R          | These bits are always read as 0.          |
| 13 to 11   | ASID2 to ASID0  | All 0                | R/W        |   |
| 10         | -               | 0                    | R          | Reserved<br>This bit is always read as 0. |
| 9          | -               | 1                    | R          | Reserved<br>This bit is always read as 1. |
| -          | -               | 0                    | -          | -   |

Note: The bit names and sentences in the above figure are examples, and have nothing to do with the contents of this manual.

- (1) Bit  
Indicates the bit number or numbers.  
In the case of a 32-bit register, the bits are arranged in order from 31 to 0. In the case of a 16-bit register, the bits are arranged in order from 15 to 0.
- (2) Bit name  
Indicates the name of the bit or bit field.  
When the number of bits has to be clearly indicated in the field, appropriate notation is included (e.g., ASID[3:0]).  
A reserved bit is indicated by "-".  
Certain kinds of bits, such as those of timer counters, are not assigned bit names. In such cases, the entry under Bit Name is blank.
- (3) Initial value  
Indicates the value of each bit immediately after a power-on reset, i.e., the initial value.  
0: The initial value is 0  
1: The initial value is 1  
-: The initial value is undefined
- (4) R/W  
For each bit and bit field, this entry indicates whether the bit or field is readable or writable, or both writing to and reading from the bit or field are impossible.  
The notation is as follows:  
R/W: The bit or field is readable and writable.  
R/(W): The bit or field is readable and writable.  
However, writing is only performed to flag clearing.  
R: The bit or field is readable.  
"R" is indicated for all reserved bits. When writing to the register, write the value under Initial Value in the bit chart to reserved bits or fields.  
W: The bit or field is writable.
- (5) Description  
Describes the function of the bit or field and specifies the values for writing.

#### 4. Description of Abbreviations

The abbreviations used in this manual are listed below.

- Abbreviations specific to this product

| <b>Abbreviation</b> | <b>Description</b>             |
|---------------------|--------------------------------|
| BSC                 | Bus controller                 |
| CPG                 | Clock pulse generator          |
| INT                 | Interrupt controller           |
| SCI                 | Serial communication interface |
| TMR                 | 8-bit timer                    |
| TPU                 | 16-bit timer pulse unit        |
| WDT                 | Watchdog timer                 |

- Abbreviations other than those listed above

| <b>Abbreviation</b> | <b>Description</b>   |
|---------------------|--|
| ACIA                | Asynchronous communication interface adapter                               |
| bps                 | Bits per second  |
| CRC                 | Cyclic redundancy check  |
| DMA                 | Direct memory access   |
| DMAC                | Direct memory access controller  |
| GSM                 | Global System for Mobile Communications                                    |
| Hi-Z                | High impedance   |
| IEBus               | Inter Equipment Bus (IEBus is a trademark of NEC Electronics Corporation.) |
| I/O                 | Input/output   |
| IrDA                | Infrared Data Association  |
| LSB                 | Least significant bit  |
| MSB                 | Most significant bit   |
| NC                  | No connection  |
| PLL                 | Phase-locked loop  |
| PWM                 | Pulse width modulation   |
| SFR                 | Special function register  |
| SIM                 | Subscriber Identity Module   |
| UART                | Universal asynchronous receiver/transmitter                                |
| VCO                 | Voltage-controlled oscillator  |

All trademarks and registered trademarks are the property of their respective owners.

# Section 1 Overview

## 1.1 Features

The H8S/2426 Group, H8S/2426R Group, and H8S/2424 Group are CISC (Complex Instruction Set Computer) microprocessors that integrate an H8S/2600 CPU core, which has an internal 16-bit architecture and is upward-compatible with Renesas-original H8/300, H8/300H, and H8S CPUs.

The on-chip peripheral functions provided for enabling system configuration at a low cost are the DMA controller, EXDMA controller\*, data transfer controller, serial communication interface, I<sup>2</sup>C bus interface 2, synchronous serial communication unit, A/D converter, D/A converter, and various timers. On-chip ROM is flash memory whose size is 256 Kbytes and 128 Kbytes.

Note: \* Not supported by the H8S/2424 Group.

### 1.1.1 Applications

Application field examples: PC peripheral equipment, office automation equipment, consumer equipment, etc.

## 1.1.2 Overview of Specifications

The specifications of this LSI are summarized in table 1.1.

**Table 1.1 Overview of Specifications**

| Type   | Module/<br>Function | Description  |
|--------|---------------------|--|
| Memory | ROM                 | <ul style="list-style-type: none"> <li>• Flash memory version               <ul style="list-style-type: none"> <li>— User ROM: 256 Kbytes and 128 Kbytes</li> <li>— Data flash: 8 Kbytes</li> </ul> </li> <li>• ROM-less version</li> </ul>  |
|        | RAM                 | RAM size: 64 Kbytes and 48 Kbytes  |
| CPU    | CPU                 | <ul style="list-style-type: none"> <li>• 16-bit high-speed H8S/2600 CPU (CISC type)<br/>Upward-compatible with H8/300, H8/300H, and H8S CPUs on an object level</li> <li>• General register mode (Sixteen 16-bit general registers)</li> <li>• Eight addressing modes</li> <li>• Address space: 16 Mbytes (program: 16 Mbytes, data: 16 Mbytes)</li> <li>• Number of basic instructions<br/>69 types (arithmetic and logic, multiply and divide, bit-manipulation, and multiply-and-accumulate instructions)</li> <li>• Minimum instruction execution time (ns)<br/>30.3 ns when system clock <math>\phi = 33</math> MHz and <math>V_{cc} = 3.0</math> to <math>3.6</math> V (ADD instruction)</li> <li>• Multiplier is included (<math>16 \times 16 \rightarrow 32</math> bits)</li> <li>• Multiply-and-accumulate instructions are supported (<math>16 \times 16 + 32 \rightarrow 32</math> bits)</li> </ul> |
|        | Operating mode      | Advanced mode  |

| Type                    | Module/<br>Function         | Description  |
|-------------------------|-----------------------------|--|
| CPU                     | MCU<br>operating<br>mode    | <ul style="list-style-type: none"> <li>• Mode 1: Expanded mode with on-chip ROM disabled, 16-bit bus (MD2 and MD1 pins are low and MD0 pin is high)</li> <li>• Mode 2: Expanded mode with on-chip ROM disabled, 8-bit bus (MD2 pin is low, MD1 pin is high, and MD0 pin is low)</li> <li>• Mode 3: Boot mode (MD2 pin is low and MD1 and MD0 pins are high)</li> <li>• Mode 4: Expanded mode with on-chip ROM enabled, 8-bit bus (MD2 pin is high and MD1 and MD0 pins are low)</li> <li>• Mode 7: Single-chip mode (MD2, MD1, and MD0 pins are high)</li> <li>• Power-down modes (a power-down mode is entered when the SLEEP instruction is executed)</li> </ul>   |
| Interrupts<br>(sources) | Interrupt<br>controller     | <ul style="list-style-type: none"> <li>• External interrupt pins<br/>H8S/2426 Group, H8S/2426R Group:<br/>33 pins (NMI, <math>\overline{\text{IRQ15-A}}</math> to <math>\overline{\text{IRQ0-A}}</math>, <math>\overline{\text{IRQ15-B}}</math> to <math>\overline{\text{IRQ0-B}}</math>)<br/>H8S/2424 Group:<br/>17 pins (NMI, <math>\overline{\text{IRQ7-A}}</math> to <math>\overline{\text{IRQ0-A}}</math>, <math>\overline{\text{IRQ7-B}}</math> to <math>\overline{\text{IRQ0-B}}</math>)</li> <li>• Internal interrupt sources<br/>H8S/2426 Group, H8S/2426R Group: 96 sources<br/>H8S/2424 Group: 94 sources</li> <li>• Two interrupt control modes (specified by the interrupt control register)</li> <li>• Eight priority levels can be set (specified by the interrupt priority registers)</li> <li>• Independent vector addresses</li> </ul> |
| DMA                     | DMA<br>controller<br>(DMAC) | <ul style="list-style-type: none"> <li>• DMA transfer is possible on four channels</li> <li>• Three activation sources (auto-request, on-chip module interrupt, and external request)</li> <li>• Byte or word can be set as the transfer unit</li> <li>• Short address mode or full address mode can be selected</li> <li>• 16-Mbyte address space can be specified directly</li> </ul>  |

| Type                         | Module/<br>Function                     | Description  |
|------------------------------|---|--|
| DMA                          | EXDMA<br>controller<br>(EXDMAC)         | <ul style="list-style-type: none"> <li>• DMA transfer is possible on two channels</li> <li>• Two activation sources (auto-request and external request)</li> <li>• Two transfer modes (normal mode and block transfer mode)</li> <li>• Dual address mode or single address mode can be selected</li> <li>• 16-Mbyte address space can be specified directly</li> <li>• Repeat area can be set</li> </ul> <p>Note: * EXDMAC is supported only by the H8S/2426 Group and H8S/2426R Group.</p>  |
|                              | Data<br>transfer<br>controller<br>(DTC) | <ul style="list-style-type: none"> <li>• Transfer is possible on any number of channels</li> <li>• An interrupt source can trigger data transfer (chain transfer is possible)</li> <li>• Three transfer modes (normal mode, repeat mode, and block transfer mode)</li> <li>• Byte or word can be set as the transfer unit</li> <li>• Activation by software is possible</li> </ul>   |
| External<br>bus<br>extension | Bus<br>controller<br>(BSC)              | <ul style="list-style-type: none"> <li>• External address space: 16 Mbytes</li> <li>• Manages the external address space divided into eight areas<br/>Chip select signals (<math>\overline{CS0}</math> to <math>\overline{CS7}</math>) can be output<br/>8-bit access or 16-bit access can be selected<br/>2-state access or 3-state access can be selected<br/>Program wait states can be inserted</li> <li>• External memory interfaces (burst ROM, DRAM*<sup>1</sup>, synchronous DRAM*<sup>2</sup>, address/data multiplexed I/O)</li> <li>• Bus arbitration function (bus arbitration of the bus masters CPU, DTC, DMAC, and EXDMAC)</li> </ul> <p>Notes: 1. DRAM is not supported in the 5-V version.<br/>2. EXDMAC is supported only by the H8S/2426 Group and H8S/2426R Group.</p> |

| Type          | Module/<br>Function         | Description   |
|---------------|-----------------------------|---|
| Clock         | Clock pulse generator (CPG) | <ul style="list-style-type: none"> <li>This LSI has a single on-chip clock pulse generator circuit</li> <li>Consists of an oscillator, a system-clock PLL circuit, a divider, and the system clock frequency can be changed<br/>System clock (<math>\phi</math>) cycle: 8 to 33 MHz</li> <li>Six power-down modes<br/>Divided clock mode, sleep mode, module stop function, all module clock stop mode, software standby mode, and hardware standby mode</li> </ul>   |
| A/D converter | A/D converter (ADC)         | <ul style="list-style-type: none"> <li>Two units</li> <li>10-bit resolution</li> <li>Number of input channels<br/>H8S/2426 Group and H8S/2426R Group: 16 channels<br/>— Unit 0: 8 channels<br/>— Unit 1: 8 channels<br/>H8S/2424 Group: 10 channels<br/>— Unit 0: 8 channels<br/>— Unit 1: 2 channels</li> <li>Sample and hold functionality</li> <li>Conversion time:<br/>3-V version: 4.0 <math>\mu</math>s per channel (when A/D conversion clock is set to 10 MHz)<br/>5-V version: 2.5 <math>\mu</math>s per channel (when A/D conversion clock is set to 16 MHz)</li> <li>Two kinds of operating modes (single mode and scan mode)</li> <li>Three types of A/D conversion start (software, trigger by timer (TPU or TMR), or external trigger)</li> </ul> |
| D/A converter | D/A converter (DAC)         | <ul style="list-style-type: none"> <li>Resolution (8 bits) <math>\times</math> Number of output channels (2 channels)</li> <li>Conversion time: Maximum 10 <math>\mu</math>s (with 20-pF load)</li> <li>Output voltage: 0 V to Vref</li> </ul>  |

| Type             | Module/<br>Function                  | Description  |
|------------------|--------------------------------------|--|
| Timer            | 16-bit timer pulse unit (TPU)        | <ul style="list-style-type: none"> <li>• 16-bit timer × 12 channels (general pulse timer unit)</li> <li>• Eight counter input clocks can be selected for each channel</li> <li>• Maximum 16-pulse input/output (when external expanded mode is set)</li> <li>• Maximum 32-pulse input/output (when single-chip mode is set)</li> <li>• Counter clear operation, simultaneous write to multiple timer counters (TCNT), simultaneous clearing by compare match and input capture, register simultaneous input/output possible by counter synchronous operation, and maximum of 15-phase PWM output by combination with synchronous operation</li> <li>• Buffer operation, phase counting mode (two-phase encoder input), and cascaded operation settable for channels</li> <li>• Input capture function</li> <li>• Output compare function (waveform output at compare match)</li> </ul> |
|                  | 8-bit timer (TMR)                    | <ul style="list-style-type: none"> <li>• 8-bit timer × 2 channels (operation as a 16-bit timer is also possible)</li> <li>• Selection of seven clock sources: Six internal clock signals or an external clock input</li> <li>• Pulse output with an arbitrary duty cycle or PWM output</li> </ul>  |
|                  | Programmable pulse generator (PPG)   | <ul style="list-style-type: none"> <li>• 16-bit pulse output</li> <li>• Pulse outputs are divided into four groups<br/>Non-overlap mode is available<br/>Inverted output can be specified</li> <li>• Can operate together with the data transfer controller (DTC) and DMA controller (DMAC)</li> </ul>   |
| Watchdog timer   | Watchdog timer (WDT)                 | <ul style="list-style-type: none"> <li>• 8-bit timer × 1 channel (eight counter input clocks can be selected)</li> <li>• Switchable between watchdog timer mode and interval timer mode</li> </ul>   |
| Serial interface | Serial communication interface (SCI) | <ul style="list-style-type: none"> <li>• Five channels (asynchronous or clocked synchronous serial communication mode)</li> <li>• Full-duplex communication capability</li> <li>• Choice of any bit rate and choice of LSB-first or MSB-first</li> <li>• IrDA data transmission/reception based on the IrDA standard version 1.0</li> </ul>  |
| Smart Card/SIM   |                                      | SCI supports Smart Card (SIM) interface  |

| Type                         | Module/<br>Function                         | Description   |
|------------------------------|---|---|
| High-function communications | I <sup>2</sup> C bus interface 2 (IIC2)     | <ul style="list-style-type: none"> <li>• Four channels</li> <li>• Continuous transmission/reception</li> <li>• Start and stop conditions generated automatically in master mode</li> <li>• Selection of acknowledge output levels when receiving</li> <li>• Automatic loading of acknowledge bit when transmitting</li> <li>• Bit synchronization/wait function</li> </ul>  |
|                              | Synchronous serial communication unit (SSU) | <ul style="list-style-type: none"> <li>• One channel</li> <li>• Master mode or slave mode can be selected</li> <li>• Standard mode or bidirectional mode can be selected</li> <li>• Full-duplex communication capability</li> <li>• Consecutive serial communication capability</li> </ul>  |

Note: Connect NC to VSS or leave it open.  
The VCL pin must be connected to an external capacitor (recommended value: 0.1  $\mu\text{F}$ ).

**Figure 1.5 Pin Assignments for H8S/2426 Group and H8S/2426R Group (2)**

- Notes: 1. Emulator enable pin. In normal operating mode, this pin should be fixed low.  
 Driving this pin high in the flash-memory version enables the on-chip emulation function.  
 When the on-chip emulation function is in use, pins P53, PG4, PG5, PG6, and WDT0VF are used exclusively as the on-chip emulator pins.  
 2. The VCL pin should be connected to an external capacitor.  
 3. Not included in the 5-V version.  
 4. This pin is dedicated to the on-chip emulator. This pin is enabled when the EMLE pin is high.

Note: \* Not supported in the 5-V version.

### 1.4.3 Pin Functions

**Table 1.5 Pin Functions**

| Type         | Symbol            | Pin No.                        |                                   |                               | I/O    | Function   |
|--------------|-------------------|--------------------------------|-----------------------------------|-------------------------------|--------|--|
|              |                   | H8S/2426, H8S/2426R            | H8S/2424                          | PLQP0120LA-A,<br>PLQP0120KA-A |        |  |
| Power supply | $V_{CC}$          | 4, 72, 98, 99                  | B2, N12, E11, E13                 | 2, 60, 83, 84                 | Input  | For connection to the power supply. $V_{CC}$ pins should be connected to the system power supply.  |
|              | $V_{SS}$          | 2, 10, 18, 25, 50, 70, 95, 102 | A1, E2, F4, H1, N5, M11, E10, F11 | 8, 17, 22, 58, 80, 87         | Input  | For connection to ground. $V_{SS}$ pins should be connected to the system power supply (0 V).  |
|              | $PLL_{V_{CC}}$    | 91                             | H13                               | 76                            | Input  | Power supply pin for the on-chip PLL oscillator.   |
|              | $PLL_{V_{SS}}$    | 93                             | G13                               | 78                            | Input  | Ground pin for the on-chip PLL oscillator.   |
|              | VCL               | 41                             | L3                                | 33                            | Output | This pin must not be connected to the power supply and should be connected to the $V_{SS}$ pin via a 0.1- $\mu$ F (recommended value) capacitor (place it close to pin).   |
| Clock        | XTAL              | 96                             | F12                               | 81                            | Input  | For connection to a crystal oscillator. See section 22, Clock Pulse Generator, for typical connection diagrams for a crystal resonator and external clock input.   |
|              | EXTAL             | 97                             | F13                               | 82                            | Input  | For connection to a crystal oscillator. The EXTAL pin can also input an external clock. See section 22, Clock Pulse Generator, for typical connection diagrams for a crystal resonator and external clock input. |
|              | $\phi$            | 94                             | F10                               | 79                            | Output | Supplies the system clock to external devices.   |
|              | SDRAM $\phi^{*1}$ | 36                             | M1                                | —                             | Output | When a synchronous DRAM is connected, this pin is connected to the CLK pin of the synchronous DRAM. For details, refer to section 6, Bus Controller (BSC).   |

|  |                          | Pin No.                                       |   |  |                  |  |
|--|--------------------------|---|---|--|------------------|--|

| Type                                   | Symbol                   | PLQP0144KA-A                                  | PTLG0145JB-A  | PLQP0120KA-A                                 | I/O              | Function   |
| Operating mode control                 | MD2                      | 1   | B1  | 1  | Input            | These pins set the operating mode. These pins should not be changed during operation.  |
|  | MD1                      | 144   | A2  | 120  |                  |  |
|  | MD0                      | 143   | A3  | 119  |                  |  |
| System control                         | $\overline{\text{RES}}$  | 92  | G11   | 77   | Input            | Reset pin. When this pin is driven low, the chip is reset.   |
|  | $\overline{\text{STBY}}$ | 103   | D13   | 88   | Input            | When this pin is driven low, a transition is made to hardware standby mode.  |
|  | EMLE                     | 32  | K1  | 30   | Input            | On-chip emulator enable pin. When the on-chip emulator is used, this pin should be fixed high. At this time, pins P53, PG4 to PG6, and $\overline{\text{WDTOVF}}$ are used exclusively by the on-chip emulator. Therefore, the corresponding pin functions of those pins are not available. When the on-chip emulator is not used, this pin should be fixed low. |
| Address bus                            | A23 to A0                | 31 to 26,<br>24 to 19,<br>17 to 11,<br>9 to 5 | J3, K2, J1, K4,<br>H3, J2, J4, G3,<br>H2, G1, H4, G4,<br>F1, G2, F3, E4,<br>E1, F2, E3, D1,<br>D3, D2, C3, C1 | 29 to 23,<br>21 to 18,<br>16 to 9,<br>7 to 3 | Output           | These pins output an address.  |
| Data bus                               | D15 to D0                | 80 to 73,<br>71,<br>69 to 63                  | K11, K12, L13,<br>L11, M12, L12,<br>N13, M13, N11,<br>M11, N10, L9,<br>M10, N9, K10,<br>L8                    | 68 to 61,<br>59,<br>57 to 51                 | Input/<br>output | These pins constitute a bidirectional data bus. When an address/data multiplexed I/O space is accessed, an address is also output.   |
| Address/<br>data<br>multiplexed<br>bus | AD15 to AD0              | 80 to 73,<br>71,<br>69 to 63                  | K11, K12, L13,<br>L11, M12, L12,<br>N13, M13, N11,<br>M10, N10, K10,<br>L10, M9, N9, K9                       | 68 to 61,<br>59,<br>57 to 51                 | Input/<br>output | These pins output an address, and input or output data.  |

- Notes: 1. Not supported in the H8S/2426 Group and H8S/2424 Group.  
 2. Not supported in the H8S/2424 Group.  
 3. Not supported in the 5-V version.

## Section 2 CPU

The H8S/2600 CPU is a high-speed central processing unit with an internal 32-bit architecture that is upward-compatible with the H8/300 and H8/300H CPUs. The H8S/2600 CPU has sixteen 16-bit general registers, can address a 16-Mbyte linear address space, and is ideal for realtime control. This section describes the H8S/2600 CPU. The usable modes and address spaces differ depending on the product. For details on each product, refer to section 3, MCU Operating Modes.

### 2.1 Features

- Upward-compatible with H8/300 and H8/300H CPUs  
Can execute H8/300 and H8/300H CPUs object programs
- General-register architecture  
Sixteen 16-bit general registers also usable as sixteen 8-bit registers or eight 32-bit registers
- Sixty-nine basic instructions  
8/16/32-bit arithmetic and logic instructions  
Multiply and divide instructions  
Powerful bit-manipulation instructions  
Multiply-and-accumulate instruction
- Eight addressing modes  
Register direct [Rn]  
Register indirect [@ERn]  
Register indirect with displacement [@(d:16,ERn) or @(d:32,ERn)]  
Register indirect with post-increment or pre-decrement [@ERn+ or @-ERn]  
Absolute address [@aa:8, @aa:16, @aa:24, or @aa:32]  
Immediate [#xx:8, #xx:16, or #xx:32]  
Program-counter relative [@(d:8,PC) or @(d:16,PC)]  
Memory indirect [@@aa:8]
- 16-Mbyte address space  
Program: 16 Mbytes  
Data: 16 Mbytes
- High-speed operation  
All frequently-used instructions execute in one or two states  
8/16/32-bit register-register add/subtract: 1 state  
8 × 8-bit register-register multiply: 2 states

16 ÷ 8-bit register-register divide: 12 states  
16 × 16-bit register-register multiply: 3 states  
32 ÷ 16-bit register-register divide: 20 states

- Two CPU operating modes

Normal mode\*

Advanced mode

Note: \* Normal mode is not available in this LSI.

- Power-down state  
Transition to power-down state by SLEEP instruction  
CPU clock speed selection

### 2.1.1 Differences between H8S/2600 CPU and H8S/2000 CPU

The differences between the H8S/2600 CPU and the H8S/2000 CPU are as shown below.

- Register configuration  
The MAC register is supported only by the H8S/2600 CPU.
- Basic instructions  
The four instructions MAC, CLRMAC, LDMAC, and STMAC are supported only by the H8S/2600 CPU.
- The number of execution states of the MULXU and MULXS instructions

| Instruction | Mnemonic        | Execution States |               |
|-------------|-----------------|------------------|---------------|
|             |                 | H8S/2600         | H8S/2000      |
| MULXU       | MULXU.B Rs, Rd  | 2*               | 12            |
|             | MULXU.W Rs, ERd | 2*               | 20            |
| MULXS       | MULXS.B Rs, Rd  | 3*               | 13            |
|             | MULXS.W Rs, ERd | 3*               | 21            |
| CLRMAC      | CLRMAC          | 1*               | Not supported |
| LDMAC       | LDMAC ERs, MACH | 1*               |               |
|             | LDMAC ERs, MACL | 1*               |               |
| STMAC       | STMAC MACH, ERd | 1*               |               |
|             | STMAC MACL, ERd | 1*               |               |

Note: \* The number of execution states is incremented following a MAC instruction.  
 In addition, there are differences in address space, CCR and EXR register functions, power-down modes, etc., depending on the model.

### 2.1.2 Differences from H8/300 CPU

In comparison to the H8/300 CPU, the H8S/2600 CPU has the following enhancements.

- More general registers and control registers  
 Eight 16-bit expanded registers, and one 8-bit and two 32-bit control registers, have been added.
- Expanded address space  
 Normal mode supports the same 64-Kbyte address space as the H8/300 CPU.  
 Advanced mode supports a maximum 16-Mbyte address space.
- Enhanced addressing  
 The addressing modes have been enhanced to make effective use of the 16-Mbyte address space.
- Enhanced instructions  
 Addressing modes of bit-manipulation instructions have been enhanced.  
 Signed multiply and divide instructions have been added.  
 A multiply-and-accumulate instruction has been added.  
 Two-bit shift and rotate instructions have been added.  
 Instructions for saving and restoring multiple registers have been added.  
 A test and set instruction has been added.

- Higher speed  
Basic instructions execute twice as fast.

Note: Normal mode is not available in this LSI.

### 2.1.3 Differences from H8/300H CPU

In comparison to the H8/300H CPU, the H8S/2600 CPU has the following enhancements.

- Additional control register  
One 8-bit and two 32-bit control registers have been added.
- Enhanced instructions  
Addressing modes of bit-manipulation instructions have been enhanced.  
A multiply-and-accumulate instruction has been added.  
Two-bit shift and rotate instructions have been added.  
Instructions for saving and restoring multiple registers have been added.  
A test and set instruction has been added.
- Higher speed  
Basic instructions execute twice as fast.

## 2.2 CPU Operating Modes

The H8S/2600 CPU has two operating modes: normal and advanced. Normal mode supports a maximum 64-Kbyte address space. Advanced mode supports a maximum 16-Mbyte total address space. The mode is selected by the mode pins.

### 2.2.1 Normal Mode

The exception vector table and stack have the same structure as in the H8/300 CPU.

- Address Space

The H8S/2600 CPU provides linear access to a maximum 64-Kbyte address space.

- Extended Registers (En)

The extended registers (E0 to E7) can be used as 16-bit registers, or as the upper 16-bit segments of 32-bit registers.

When En is used as a 16-bit register it can contain any value, even when the corresponding general register (Rn) is used as an address register. If the general register is referenced in the register indirect addressing mode with pre-decrement (@-Rn) or post-increment (@Rn+) and a carry or borrow occurs, however, the value in the corresponding extended register (En) will be affected.

- Instruction Set

All instructions and addressing modes can be used. Only the lower 16 bits of effective addresses (EA) are valid.

- Exception Vector Table and Memory Indirect Branch Addresses

In normal mode the top area starting at H'0000 is allocated to the exception vector table. One branch address is stored per 16 bits. The exception vector table in normal mode is shown in figure 2.1. For details of the exception vector table, see section 4, Exception Handling.

The memory indirect addressing mode (@@aa:8) employed in the JMP and JSR instructions uses an 8-bit absolute address included in the instruction code to specify a memory operand that contains a branch address. In normal mode the operand is a 16-bit word operand, providing a 16-bit branch address. Branch addresses can be stored in the top area from H'0000 to H'00FF. Note that this area is also used for the exception vector table.

- Stack Structure

When the program counter (PC) is pushed onto the stack in a subroutine call, and the PC, condition-code register (CCR), and extended control register (EXR) are pushed onto the stack in exception handling, they are stored as shown in figure 2.2. EXR is not pushed onto the stack in interrupt control mode 0. For details, see section 4, Exception Handling.

Note: Normal mode is not available in this LSI.

**Figure 2.1 Exception Vector Table (Normal Mode)**

**Figure 2.2 Stack Structure in Normal Mode**

## 2.2.2 Advanced Mode

- Address Space

Linear access is provided to a 16-Mbyte maximum address space.

- Extended Registers (En)

The extended registers (E0 to E7) can be used as 16-bit registers, or as the upper 16-bit segments of 32-bit registers or address registers.

- Instruction Set

All instructions and addressing modes can be used.

- Exception Vector Table and Memory Indirect Branch Addresses

In advanced mode the top area starting at H'00000000 is allocated to the exception vector table in units of 32 bits. In each 32 bits, the upper 8 bits are ignored and a branch address is stored in the lower 24 bits (figure 2.3). For details of the exception vector table, see section 4, Exception Handling.

**Figure 2.3 Exception Vector Table (Advanced Mode)**

The memory indirect addressing mode (@@aa:8) employed in the JMP and JSR instructions uses an 8-bit absolute address included in the instruction code to specify a memory operand that contains a branch address.

In advanced mode the operand is a 32-bit longword operand, providing a 32-bit branch address. The upper 8 bits of these 32 bits are a reserved area that is regarded as H'00. Branch addresses can be stored in the area from H'00000000 to H'000000FF. Note that the first part of this range is also used for the exception vector table.

- Stack Structure

In advanced mode, when the program counter (PC) is pushed onto the stack in a subroutine call, and the PC, condition-code register (CCR), and extended control register (EXR) are pushed onto the stack in exception handling, they are stored as shown in figure 2.4. EXR is not pushed onto the stack in interrupt control mode 0. For details, see section 4, Exception Handling.

**Figure 2.4 Stack Structure in Advanced Mode**

## 2.3 Address Space

Figure 2.5 shows a memory map of the H8S/2600 CPU. The H8S/2600 CPU provides linear access to a maximum 64-Kbyte address space in normal mode, and a maximum 16-Mbyte (architecturally 4-Gbyte) address space in advanced mode. The usable modes and address spaces differ depending on the product. For details on each product, refer to section 3, MCU Operating Modes.

**Figure 2.5 Memory Map**

Note: Normal mode is not available in this LSI.

## 2.4 Registers

The H8S/2600 CPU has the internal registers shown in figure 2.6. There are two types of registers: general registers and control registers. Control registers are a 24-bit program counter (PC), an 8-bit extended register (EXR), an 8-bit condition code register (CCR), and a 64-bit multiply-accumulate register (MAC).

Figure 2.6 CPU Registers

## 2.4.1 General Registers

The H8S/2600 CPU has eight 32-bit general registers. These general registers are all functionally alike and can be used as both address registers and data registers. When a general register is used as a data register, it can be accessed as a 32-bit, 16-bit, or 8-bit register. Figure 2.7 illustrates the usage of the general registers. When the general registers are used as 32-bit registers or address registers, they are designated by the letters ER (ER0 to ER7).

The ER registers divide into 16-bit general registers designated by the letters E (E0 to E7) and R (R0 to R7). These registers are functionally equivalent, providing a maximum sixteen 16-bit registers. The E registers (E0 to E7) are also referred to as extended registers.

The R registers divide into 8-bit general registers designated by the letters RH (R0H to R7H) and RL (R0L to R7L). These registers are functionally equivalent, providing a maximum sixteen 8-bit registers.

The usage of each register can be selected independently.

General register ER7 has the function of stack pointer (SP) in addition to its general-register function, and is used implicitly in exception handling and subroutine calls. Figure 2.8 shows the stack.

**Figure 2.7 Usage of General Registers**

**Figure 2.8 Stack**

### 2.4.2 Program Counter (PC)

This 24-bit counter indicates the address of the next instruction the CPU will execute. The length of all CPU instructions is 2 bytes (one word), so the least significant PC bit is ignored. (When an instruction is fetched, the least significant PC bit is regarded as 0.)

### 2.4.3 Extended Register (EXR)

EXR is an 8-bit register that can be manipulated by the LDC, STC, ANDC, ORC, and XORC instructions. When these instructions except for the STC instruction is executed, all interrupts including NMI will be masked for three states after execution is completed.

| Bit    | Bit Name | Initial Value | R/W | Description  |
|--------|----------|---------------|-----|--|
| 7      | T        | 0             | R/W | Trace Bit<br>When this bit is set to 1, a trace exception is started each time an instruction is executed. When this bit is cleared to 0, instructions are executed in sequence. |
| 6 to 3 | —        | All 1         | —   | Reserved<br>These bits are always read as 1.   |
| 2      | I2       | 1             | R/W | These bits designate the interrupt mask level (0 to 7). For details, refer to section 5, Interrupt Controller.   |
| 1      | I1       | 1             | R/W |  |
| 0      | I0       | 1             | R/W |  |

### 2.4.4 Condition-Code Register (CCR)

This 8-bit register contains internal CPU status information, including an interrupt mask bit (I) and half-carry (H), negative (N), zero (Z), overflow (V), and carry (C) flags.

Operations can be performed on the CCR bits by the LDC, STC, ANDC, ORC, and XORC instructions. The N, Z, V, and C flags are used as branching conditions for conditional branch (Bcc) instructions.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | I        | 1             | R/W | <p>Interrupt Mask Bit</p> <p>Masks interrupts other than NMI when set to 1. NMI is accepted regardless of the I bit setting. The I bit is set to 1 by hardware at the start of an exception-handling sequence. For details, refer to section 5, Interrupt Controller.</p>   |
| 6   | UI       | Undefined     | R/W | <p>User Bit or Interrupt Mask Bit</p> <p>Can be written and read by software using the LDC, STC, ANDC, ORC, and XORC instructions. This bit cannot be used as an interrupt mask bit in this LSI.</p>  |
| 5   | H        | Undefined     | R/W | <p>Half-Carry Flag</p> <p>When the ADD.B, ADDX.B, SUB.B, SUBX.B, CMP.B, or NEG.B instruction is executed, this flag is set to 1 if there is a carry or borrow at bit 3, and cleared to 0 otherwise. When the ADD.W, SUB.W, CMP.W, or NEG.W instruction is executed, the H flag is set to 1 if there is a carry or borrow at bit 11, and cleared to 0 otherwise. When the ADD.L, SUB.L, CMP.L, or NEG.L instruction is executed, the H flag is set to 1 if there is a carry or borrow at bit 27, and cleared to 0 otherwise.</p> |
| 4   | U        | Undefined     | R/W | <p>User Bit</p> <p>Can be written and read by software using the LDC, STC, ANDC, ORC, and XORC instructions.</p>  |
| 3   | N        | Undefined     | R/W | <p>Negative Flag</p> <p>Stores the value of the most significant bit of data as a sign bit.</p>   |

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 2   | Z        | Undefined     | R/W | Zero Flag<br>Set to 1 to indicate zero data, and cleared to 0 to indicate non-zero data.   |
| 1   | V        | Undefined     | R/W | Overflow Flag<br>Set to 1 when an arithmetic overflow occurs, and cleared to 0 otherwise.  |
| 0   | C        | Undefined     | R/W | Carry Flag<br>Set to 1 when a carry occurs, and cleared to 0 otherwise. Used by: <ul style="list-style-type: none"> <li>• Add instructions, to indicate a carry</li> <li>• Subtract instructions, to indicate a borrow</li> <li>• Shift and rotate instructions, to indicate a carry</li> </ul> The carry flag is also used as a bit accumulator by bit manipulation instructions. |

#### 2.4.5 Multiply-Accumulate Register (MAC)

This 64-bit register stores the results of multiply-and-accumulate operations. It consists of two 32-bit registers denoted MACH and MACL. The lower 10 bits of MACH are valid; the upper bits are a sign extension.

#### 2.4.6 Initial Values of CPU Internal Registers

When the reset exception handling loads the start address from the vector address, PC is initialized, the T bit in EXR is cleared to 0, and the I bits in EXR and CCR are set to 1. However, the general registers and the other CCR bits are not initialized. The initial value of SP (ER7) is undefined. SP should therefore be initialized by using the MOV.L instruction immediately after a reset.

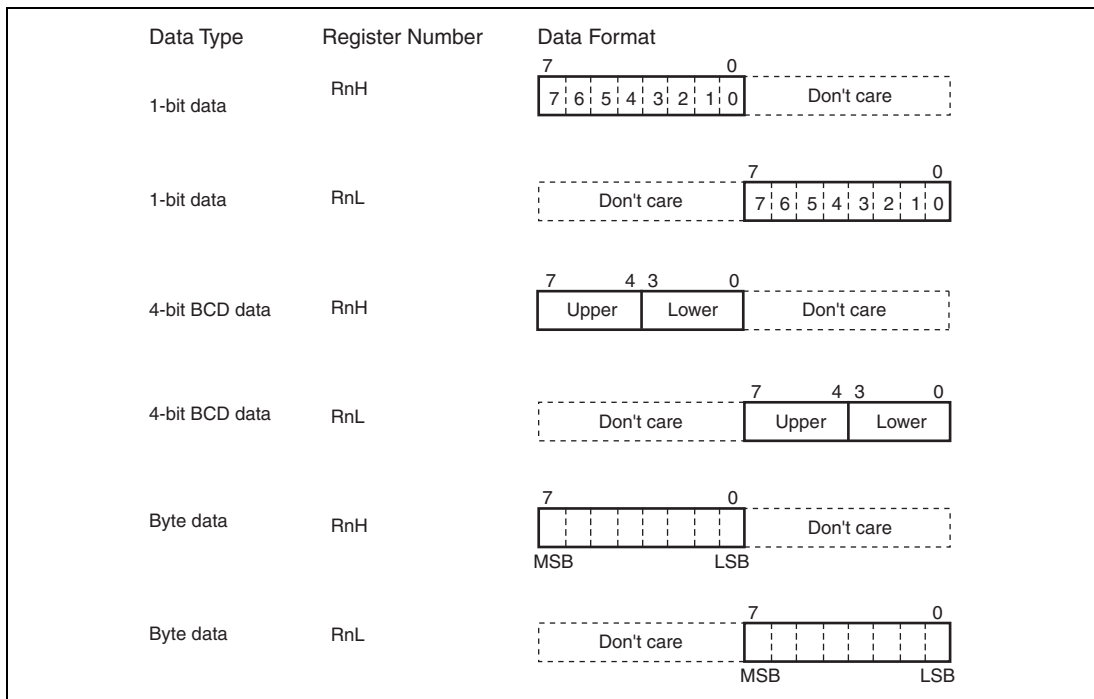

## 2.5 Data Formats

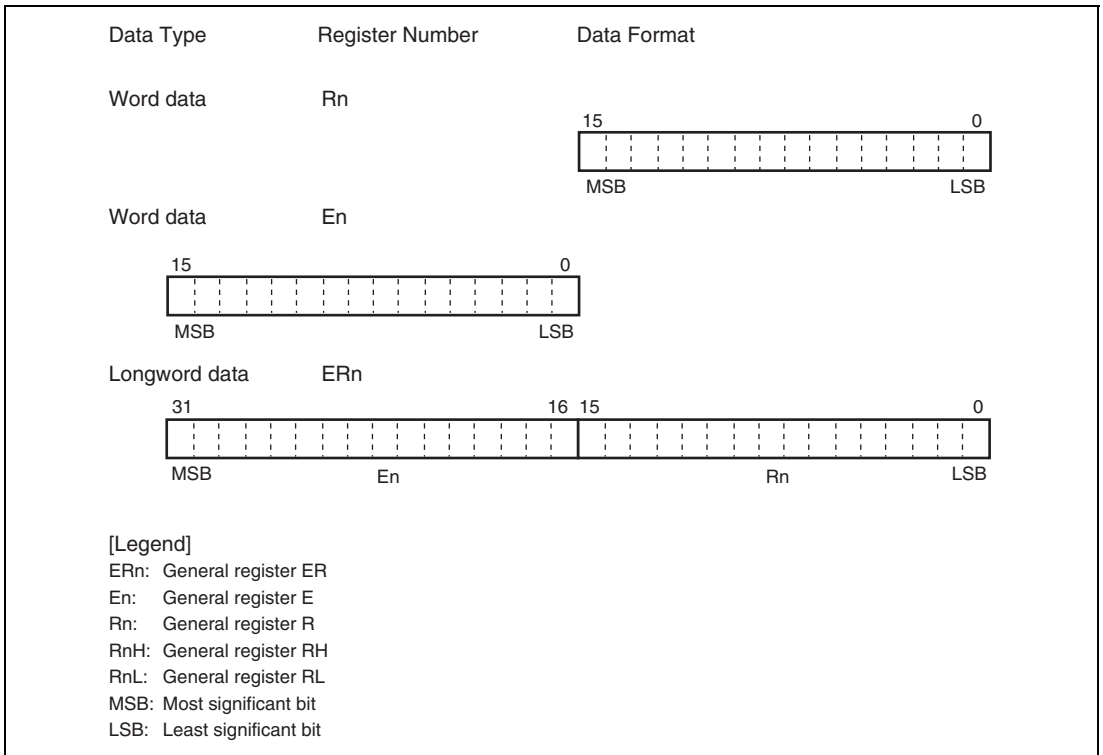

The H8S/2600 CPU can process 1-bit, 4-bit (BCD), 8-bit (byte), 16-bit (word), and 32-bit (longword) data. Bit-manipulation instructions operate on 1-bit data by accessing bit  $n$  ( $n = 0, 1, 2, \dots, 7$ ) of byte operand data. The DAA and DAS decimal-adjust instructions treat byte data as two digits of 4-bit BCD data.

### 2.5.1 General Register Data Formats

Figure 2.9 shows the data formats in general registers.

**Figure 2.9 General Register Data Formats (1)**

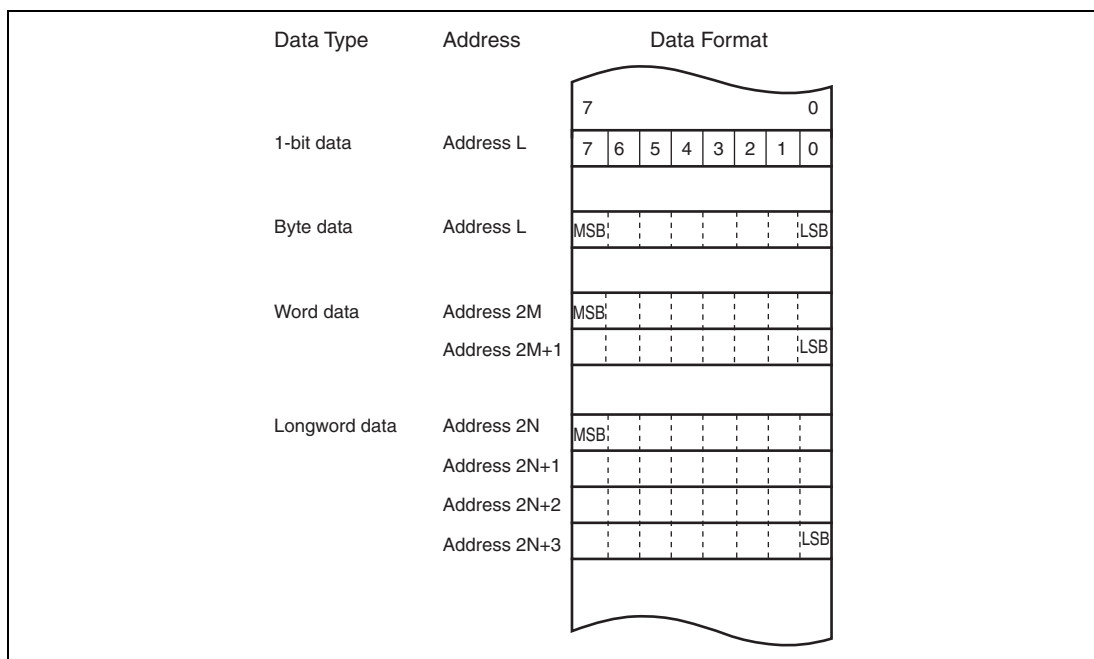

**Figure 2.9 General Register Data Formats (2)**

## 2.5.2 Memory Data Formats

Figure 2.10 shows the data formats in memory. The H8S/2600 CPU can access word data and longword data in memory, but word or longword data must begin at an even address. If an attempt is made to access word or longword data at an odd address, no address error occurs but the least significant bit of the address is regarded as 0, so the access starts at the preceding address. This also applies to instruction fetches.

When SP (ER7) is used as an address register to access the stack, the operand size should be word size or longword size.

**Figure 2.10 Memory Data Formats**

## 2.6 Instruction Set

The H8S/2600 CPU has 69 types of instructions. The instructions are classified by function in table 2.1.

**Table 2.1 Instruction Classification**

| Function                  | Instructions  | Size   | Types |
|---------------------------|---|--------|-------|
| Data transfer             | MOV   | B/W/L  | 5     |
|                           | POP* <sup>1</sup> , PUSH* <sup>1</sup>  | W/L    |       |
|                           | LDM, STM  | L      |       |
|                           | MOVFP* <sup>3</sup> , MOVTP* <sup>3</sup>   | B      |       |
| Arithmetic operations     | ADD, SUB, CMP, NEG  | B/W/L  | 23    |
|                           | ADDX, SUBX, DAA, DAS  | B      |       |
|                           | INC, DEC  | B/W/L  |       |
|                           | ADDS, SUBS  | L      |       |
|                           | MULXU, DIVXU, MULXS, DIVXS  | B/W    |       |
|                           | EXTU, EXTS  | W/L    |       |
|                           | TAS* <sup>4</sup>   | B      |       |
| MAC, LDMAC, STMAC, CLRMAC | —   |        |       |
| Logic operations          | AND, OR, XOR, NOT   | B/W/L  | 4     |
| Shift                     | SHAL, SHAR, SHLL, SHLR, ROTL, ROTR, ROTXL, ROTXR                                  | B/W/L  | 8     |
| Bit manipulation          | BSET, BCLR, BNOT, BTST, BLD, BILD, BST, BIST, BAND, BIAND, BOR, BIOR, BXOR, BIXOR | B      | 14    |
| Branch                    | Bcc* <sup>2</sup> , JMP, BSR, JSR, RTS  | —      | 5     |
| System control            | TRAPA, RTE, SLEEP, LDC, STC, ANDC, ORC, XORC, NOP                                 | —      | 9     |
| Block data transfer       | EEPMOV  | —      | 1     |
|                           |   | Total: | 69    |

### [Legend]

B: Byte

W: Word

L: Longword

Notes: 1. POP.W Rn and PUSH.W Rn are identical to MOV.W @SP+, Rn and MOV.W Rn, @-SP. POP.L ERn and PUSH.L ERn are identical to MOV.L @SP+, ERn and MOV.L ERn, @-SP.

2. Bcc is the general name for conditional branch instructions.
3. Cannot be used in this LSI.
4. Only register ER0, ER1, ER4, or ER5 should be used when using the TAS instruction.

### 2.6.1 Table of Instructions Classified by Function

Tables 2.3 to 2.10 summarize the instructions in each functional category. The notation used in tables 2.3 to 2.10 is defined below.

**Table 2.2 Operation Notation**

| Symbol | Description                                    |
|--------|--|
| Rd     | General register (destination)*                |
| Rs     | General register (source)*                     |
| Rn     | General register*                              |
| ERn    | General register (32-bit register)             |
| MAC    | Multiply-accumulate register (32-bit register) |
| (EAd)  | Destination operand                            |
| (EAs)  | Source operand                                 |
| EXR    | Extended register                              |
| CCR    | Condition-code register                        |
| N      | N (negative) flag in CCR                       |
| Z      | Z (zero) flag in CCR                           |
| V      | V (overflow) flag in CCR                       |
| C      | C (carry) flag in CCR                          |
| PC     | Program counter                                |
| SP     | Stack pointer                                  |
| #IMM   | Immediate data                                 |
| disp   | Displacement                                   |
| +      | Addition                                       |
| −      | Subtraction                                    |
| ×      | Multiplication                                 |
| ÷      | Division                                       |
| ^      | Logical AND                                    |
| ∨      | Logical OR                                     |
| ⊕      | Logical exclusive OR                           |

| Symbol         | Description                    |
|----------------|--------------------------------|
| →              | Move                           |
| ~              | NOT (logical complement)       |
| :8/:16/:24/:32 | 8-, 16-, 24-, or 32-bit length |

Note: \* General registers include 8-bit registers (R0H to R7H, R0L to R7L), 16-bit registers (R0 to R7, E0 to E7), and 32-bit registers (ER0 to ER7).

**Table 2.3 Data Transfer Instructions**

| Instruction | Size* | Function  |
|-------------|-------|---|
| MOV         | B/W/L | (EAs) → Rd, Rs → (EAd)<br>Moves data between two general registers or between a general register and memory, or moves immediate data to a general register. |
| MOVFPPE     | B     | Cannot be used in this LSI.   |
| MOVTPE      | B     | Cannot be used in this LSI.   |
| POP         | W/L   | @SP+ → Rn<br>Pops a general register from the stack. POP.W Rn is identical to MOV.W @SP+, Rn. POP.L ERn is identical to MOV.L @SP+, ERn.                    |
| PUSH        | W/L   | Rn → @-SP<br>Pushes a general register onto the stack. PUSH.W Rn is identical to MOV.W Rn, @-SP. PUSH.L ERn is identical to MOV.L ERn, @-SP.                |
| LDM         | L     | @SP+ → Rn (register list)<br>Pops two or more general registers from the stack.   |
| STM         | L     | Rn (register list) → @-SP<br>Pushes two or more general registers onto the stack.   |

Note: \* Size refers to the operand size.

B: Byte

W: Word

L: Longword

**Table 2.4 Arithmetic Operations Instructions (1)**

| <b>Instruction</b> | <b>Size*</b> | <b>Function</b>   |
|--------------------|--------------|---|
| ADD<br>SUB         | B/W/L        | $Rd \pm Rs \rightarrow Rd$ , $Rd \pm \#IMM \rightarrow Rd$<br>Performs addition or subtraction on data in two general registers, or on immediate data and data in a general register. (Immediate byte data cannot be subtracted from byte data in a general register. Use the SUBX or ADD instruction.) |
| ADDX<br>SUBX       | B            | $Rd \pm Rs \pm C \rightarrow Rd$ , $Rd \pm \#IMM \pm C \rightarrow Rd$<br>Performs addition or subtraction with carry or borrow on byte data in two general registers, or on immediate data and data in a general register.   |
| INC<br>DEC         | B/W/L        | $Rd \pm 1 \rightarrow Rd$ , $Rd \pm 2 \rightarrow Rd$<br>Increments or decrements a general register by 1 or 2. (Byte operands can be incremented or decremented by 1 only.)  |
| ADDS<br>SUBS       | L            | $Rd \pm 1 \rightarrow Rd$ , $Rd \pm 2 \rightarrow Rd$ , $Rd \pm 4 \rightarrow Rd$<br>Adds or subtracts the value 1, 2, or 4 to or from data in a 32-bit register.   |
| DAA<br>DAS         | B            | $Rd$ (decimal adjust) $\rightarrow Rd$<br>Decimal-adjusts an addition or subtraction result in a general register by referring to the CCR to produce 4-bit BCD data.  |
| MULXU              | B/W          | $Rd \times Rs \rightarrow Rd$<br>Performs unsigned multiplication on data in two general registers: either 8 bits $\times$ 8 bits $\rightarrow$ 16 bits or 16 bits $\times$ 16 bits $\rightarrow$ 32 bits.  |
| MULXS              | B/W          | $Rd \times Rs \rightarrow Rd$<br>Performs signed multiplication on data in two general registers: either 8 bits $\times$ 8 bits $\rightarrow$ 16 bits or 16 bits $\times$ 16 bits $\rightarrow$ 32 bits.  |
| DIVXU              | B/W          | $Rd \div Rs \rightarrow Rd$<br>Performs unsigned division on data in two general registers: either 16 bits $\div$ 8 bits $\rightarrow$ 8-bit quotient and 8-bit remainder or 32 bits $\div$ 16 bits $\rightarrow$ 16-bit quotient and 16-bit remainder.   |

Note: \* Size refers to the operand size.

B: Byte

W: Word

L: Longword

**Table 2.4 Arithmetic Operations Instructions (2)**

| <b>Instruction</b> | <b>Size*<sup>1</sup></b> | <b>Function</b>   |
|--------------------|--------------------------|---|
| DIVXS              | B/W                      | $Rd \div Rs \rightarrow Rd$<br>Performs signed division on data in two general registers: either 16 bits $\div$ 8 bits $\rightarrow$ 8-bit quotient and 8-bit remainder or 32 bits $\div$ 16 bits $\rightarrow$ 16-bit quotient and 16-bit remainder.   |
| CMP                | B/W/L                    | $Rd - Rs, Rd - \#IMM$<br>Compares data in a general register with data in another general register or with immediate data, and sets CCR bits according to the result.   |
| NEG                | B/W/L                    | $0 - Rd \rightarrow Rd$<br>Takes the two's complement (arithmetic complement) of data in a general register.  |
| EXTU               | W/L                      | $Rd$ (zero extension) $\rightarrow Rd$<br>Extends the lower 8 bits of a 16-bit register to word size, or the lower 16 bits of a 32-bit register to longword size, by padding with zeros on the left.  |
| EXTS               | W/L                      | $Rd$ (sign extension) $\rightarrow Rd$<br>Extends the lower 8 bits of a 16-bit register to word size, or the lower 16 bits of a 32-bit register to longword size, by extending the sign bit.  |
| TAS* <sup>2</sup>  | B                        | @ERd - 0, 1 $\rightarrow$ (<bit 7> of @ERd)<br>Tests memory contents, and sets the most significant bit (bit 7) to 1.   |
| MAC                | —                        | $(EAs) \times (EAd) + MAC \rightarrow MAC$<br>Performs signed multiplication on memory contents and adds the result to the multiply-accumulate register. The following operations can be performed:<br>16 bits $\times$ 16 bits + 32 bits $\rightarrow$ 32 bits, saturating<br>16 bits $\times$ 16 bits + 42 bits $\rightarrow$ 42 bits, non-saturating |
| CLRMAC             | —                        | $0 \rightarrow MAC$<br>Clears the multiply-accumulate register to zero.   |
| LDMAC              | L                        | $Rs \rightarrow MAC, MAC \rightarrow Rd$  |
| STMAC              |                          | Transfers data between a general register and a multiply-accumulate register.   |

Notes: 1. Size refers to the operand size.

B: Byte

W: Word

L: Longword

2. Only register ER0, ER1, ER4, or ER5 should be used when using the TAS instruction.

**Table 2.5 Logic Operations Instructions**

| Instruction | Size* | Function  |
|-------------|-------|---|
| AND         | B/W/L | $Rd \wedge Rs \rightarrow Rd$ , $Rd \wedge \#IMM \rightarrow Rd$<br>Performs a logical AND operation on a general register and another general register or immediate data.          |
| OR          | B/W/L | $Rd \vee Rs \rightarrow Rd$ , $Rd \vee \#IMM \rightarrow Rd$<br>Performs a logical OR operation on a general register and another general register or immediate data.               |
| XOR         | B/W/L | $Rd \oplus Rs \rightarrow Rd$ , $Rd \oplus \#IMM \rightarrow Rd$<br>Performs a logical exclusive OR operation on a general register and another general register or immediate data. |
| NOT         | B/W/L | $\sim (Rd) \rightarrow (Rd)$<br>Takes the one's complement (logical complement) of general register contents.   |

Note: \* Size refers to the operand size.

B: Byte

W: Word

L: Longword

**Table 2.6 Shift Instructions**

| Instruction    | Size* | Function  |
|----------------|-------|---|
| SHAL<br>SHAR   | B/W/L | $Rd \text{ (shift)} \rightarrow Rd$<br>Performs an arithmetic shift on general register contents.<br>1-bit or 2-bit shift is possible.    |
| SHLL<br>SHLR   | B/W/L | $Rd \text{ (shift)} \rightarrow Rd$<br>Performs a logical shift on general register contents.<br>1-bit or 2-bit shift is possible.        |
| ROTL<br>ROTR   | B/W/L | $Rd \text{ (rotate)} \rightarrow Rd$<br>Rotates general register contents.<br>1-bit or 2-bit rotation is possible.                        |
| ROTXL<br>ROTXR | B/W/L | $Rd \text{ (rotate)} \rightarrow Rd$<br>Rotates general register contents through the carry flag.<br>1-bit or 2-bit rotation is possible. |

Note: \* Size refers to the operand size.

B: Byte

W: Word

L: Longword

**Table 2.7 Bit Manipulation Instructions (1)**

| <b>Instruction</b> | <b>Size*</b> | <b>Function</b>  |
|--------------------|--------------|--|
| BSET               | B            | 1 → (<bit-No.> of <EAd>)<br>Sets a specified bit in a general register or memory operand to 1. The bit number is specified by 3-bit immediate data or the lower three bits of a general register.  |
| BCLR               | B            | 0 → (<bit-No.> of <EAd>)<br>Clears a specified bit in a general register or memory operand to 0. The bit number is specified by 3-bit immediate data or the lower three bits of a general register.  |
| BNOT               | B            | ~ (<bit-No.> of <EAd>) → (<bit-No.> of <EAd>)<br>Inverts a specified bit in a general register or memory operand. The bit number is specified by 3-bit immediate data or the lower three bits of a general register.   |
| BTST               | B            | ~ (<bit-No.> of <EAd>) → Z<br>Tests a specified bit in a general register or memory operand and sets or clears the Z flag accordingly. The bit number is specified by 3-bit immediate data or the lower three bits of a general register.                      |
| BAND               | B            | $C \wedge (<bit-No.> \text{ of } <EAd>) \rightarrow C$<br>ANDs the carry flag with a specified bit in a general register or memory operand and stores the result in the carry flag.  |
| BIAND              | B            | $C \wedge [\sim (<bit-No.> \text{ of } <EAd>)] \rightarrow C$<br>ANDs the carry flag with the inverse of a specified bit in a general register or memory operand and stores the result in the carry flag. The bit number is specified by 3-bit immediate data. |
| BOR                | B            | $C \vee (<bit-No.> \text{ of } <EAd>) \rightarrow C$<br>ORs the carry flag with a specified bit in a general register or memory operand and stores the result in the carry flag.   |
| BIOR               | B            | $C \vee [\sim (<bit-No.> \text{ of } <EAd>)] \rightarrow C$<br>ORs the carry flag with the inverse of a specified bit in a general register or memory operand and stores the result in the carry flag. The bit number is specified by 3-bit immediate data.    |

Note: \* Size refers to the operand size.

B: Byte

**Table 2.7 Bit Manipulation Instructions (2)**

| <b>Instruction</b> | <b>Size*</b> | <b>Function</b>  |
|--------------------|--------------|--|
| BXOR               | B            | $C \oplus \langle \text{bit-No.} \rangle \text{ of } \langle \text{EAd} \rangle \rightarrow C$<br>Exclusive-ORs the carry flag with a specified bit in a general register or memory operand and stores the result in the carry flag.   |
| BIXOR              | B            | $C \oplus [\sim \langle \text{bit-No.} \rangle \text{ of } \langle \text{EAd} \rangle] \rightarrow C$<br>Exclusive-ORs the carry flag with the inverse of a specified bit in a general register or memory operand and stores the result in the carry flag.<br>The bit number is specified by 3-bit immediate data. |
| BLD                | B            | $\langle \text{bit-No.} \rangle \text{ of } \langle \text{EAd} \rangle \rightarrow C$<br>Transfers a specified bit in a general register or memory operand to the carry flag.  |
| BILD               | B            | $\sim \langle \text{bit-No.} \rangle \text{ of } \langle \text{EAd} \rangle \rightarrow C$<br>Transfers the inverse of a specified bit in a general register or memory operand to the carry flag.<br>The bit number is specified by 3-bit immediate data.  |
| BST                | B            | $C \rightarrow \langle \text{bit-No.} \rangle \text{ of } \langle \text{EAd} \rangle$<br>Transfers the carry flag value to a specified bit in a general register or memory operand.  |
| BIST               | B            | $\sim C \rightarrow \langle \text{bit-No.} \rangle \text{ of } \langle \text{EAd} \rangle$<br>Transfers the inverse of the carry flag value to a specified bit in a general register or memory operand.<br>The bit number is specified by 3-bit immediate data.  |

Note: \* Size refers to the operand size.

B: Byte

**Table 2.8 Branch Instructions**

| <b>Instruction</b> | <b>Size</b>                   | <b>Function</b>   |                 |                    |                  |          |               |        |          |               |       |     |      |                |     |             |                |           |                               |         |           |                 |         |     |           |         |     |       |         |     |                |         |     |              |         |     |      |         |     |       |         |     |                  |                  |     |           |                  |     |              |                           |     |               |                           |

## 2.6.2 Basic Instruction Formats

The H8S/2600 Series instructions consist of 2-byte (1-word) units. An instruction consists of an operation field (op), a register field (r), an effective address extension (EA), and a condition field (cc).

Figure 2.11 shows examples of instruction formats.

- **Operation Field**  
Indicates the function of the instruction, the addressing mode, and the operation to be carried out on the operand. The operation field always includes the first four bits of the instruction. Some instructions have two operation fields.
- **Register Field**  
Specifies a general register. Address registers are specified by 3 bits, data registers by 3 bits or 4 bits. Some instructions have two register fields. Some have no register field.
- **Effective Address Extension**  
8, 16, or 32 bits specifying immediate data, an absolute address, or a displacement.
- **Condition Field**  
Specifies the branching condition of Bcc instructions.

**Figure 2.11 Instruction Formats (Examples)**

## 2.7 Addressing Modes and Effective Address Calculation

The H8S/2600 CPU supports the eight addressing modes listed in table 2.11. The usable address modes are different in each instruction.

Arithmetic and logic instructions can use the register direct and immediate modes. Data transfer instructions can use all addressing modes except program-counter relative and memory indirect. Bit manipulation instructions use register direct, register indirect, or absolute addressing mode to specify an operand, and register direct (BSET, BCLR, BNOT, and BTST instructions) or immediate (3-bit) addressing mode to specify a bit number in the operand.

**Table 2.11 Addressing Modes**

| No. | Addressing Mode   | Symbol                     |
|-----|---|----------------------------|
| 1   | Register direct   | Rn                         |
| 2   | Register indirect   | @ERn                       |
| 3   | Register indirect with displacement   | @(d:16,ERn)/@(d:32,ERn)    |
| 4   | Register indirect with post-increment<br>Register indirect with pre-decrement | @ERn+<br>@-ERn             |
| 5   | Absolute address  | @aa:8/@aa:16/@aa:24/@aa:32 |
| 6   | Immediate   | #xx:8/#xx:16/#xx:32        |
| 7   | Program-counter relative  | @(d:8,PC)/@(d:16,PC)       |
| 8   | Memory indirect   | @@aa:8                     |

### 2.7.1 Register Direct—Rn

The register field of the instruction code specifies an 8-, 16-, or 32-bit general register containing the operand. R0H to R7H and R0L to R7L can be specified as 8-bit registers. R0 to R7 and E0 to E7 can be specified as 16-bit registers. ER0 to ER7 can be specified as 32-bit registers.

### 2.7.2 Register Indirect—@ERn

The register field of the instruction code specifies an address register (ERn) which contains the address of the operand on memory. If the address is a program instruction address, the lower 24 bits are valid and the upper 8 bits are all assumed to be 0 (H'00).

### 2.7.3 Register Indirect with Displacement—@(**d:16**, ERn) or @(**d:32**, ERn)

A 16-bit or 32-bit displacement contained in the instruction is added to an address register (ERn) specified by the register field of the instruction code, and the sum gives the address of a memory operand. A 16-bit displacement is sign-extended when added.

### 2.7.4 Register Indirect with Post-Increment or Pre-Decrement—@ERn+ or @-ERn

**Register indirect with post-increment—@ERn+:** The register field of the instruction code specifies an address register (ERn) which contains the address of a memory operand. After the operand is accessed, 1, 2, or 4 is added to the address register contents and the sum is stored in the address register. The value added is 1 for byte access, 2 for word transfer instruction, or 4 for longword transfer instruction. For word or longword transfer instruction, the register value should be even.

**Register indirect with pre-decrement—@-ERn:** The value 1, 2, or 4 is subtracted from an address register (ERn) specified by the register field in the instruction code, and the result becomes the address of a memory operand. The result is also stored in the address register. The value subtracted is 1 for byte access, 2 for word transfer instruction, or 4 for longword transfer instruction. For word or longword transfer instruction, the register value should be even.

### 2.7.5 Absolute Address—@aa:8/@aa:16/@aa:24/@aa:32

The instruction code contains the absolute address of a memory operand. The absolute address may be 8 bits long (@aa:8), 16 bits long (@aa:16), 24 bits long (@aa:24), or 32 bits long (@aa:32). Table 2.12 indicates the accessible absolute address ranges.

To access data, the absolute address should be 8 bits (@aa:8), 16 bits (@aa:16), or 32 bits (@aa:32) long. For an 8-bit absolute address, the upper 24 bits are all assumed to be 1 (H'FFFF). For a 16-bit absolute address, the upper 16 bits are a sign extension. A 32-bit absolute address can access the entire address space.

A 24-bit absolute address (@aa:24) indicates the address of a program instruction. The upper 8 bits are all assumed to be 0 (H'00).

**Table 2.12 Absolute Address Access Ranges**

| <b>Absolute Address</b>     |                  | <b>Normal Mode*</b> | <b>Advanced Mode</b>                          |
|-----------------------------|------------------|---------------------|---|
| Data address                | 8 bits (@aa:8)   | H'FF00 to H'FFFF    | H'FFFF00 to H'FFFFFF                          |
|                             | 16 bits (@aa:16) | H'0000 to H'FFFF    | H'000000 to H'007FFF,<br>H'FF8000 to H'FFFFFF |
|                             | 32 bits (@aa:32) |                     | H'000000 to H'FFFFFF                          |
| Program instruction address | 24 bits (@aa:24) |                     |   |

Note: \* Not available in this LSI.

### 2.7.6 Immediate—#xx:8/#xx:16/#xx:32

The instruction code contains 8-bit (#xx:8), 16-bit (#xx:16), or 32-bit (#xx:32) immediate data as an operand.

The ADDS, SUBS, INC, and DEC instructions contain immediate data implicitly. Some bit manipulation instructions contain 3-bit immediate data in the instruction code, specifying a bit number. The TRAPA instruction contains 2-bit immediate data in its instruction code, specifying a vector address.

### 2.7.7 Program-Counter Relative—@(d:8, PC) or @(d:16, PC)

This mode is used in the Bcc and BSR instructions. An 8-bit or 16-bit displacement contained in the instruction code is sign-extended and added to the 24-bit PC contents to generate a branch address. Only the lower 24 bits of this branch address are valid; the upper 8 bits are all assumed to be 0 (H'00). The PC value to which the displacement is added is the address of the first byte of the next instruction, so the possible branching range is -126 to +128 bytes (-63 to +64 words) or -32766 to +32768 bytes (-16383 to +16384 words) from the branch instruction. The resulting value should be an even number.

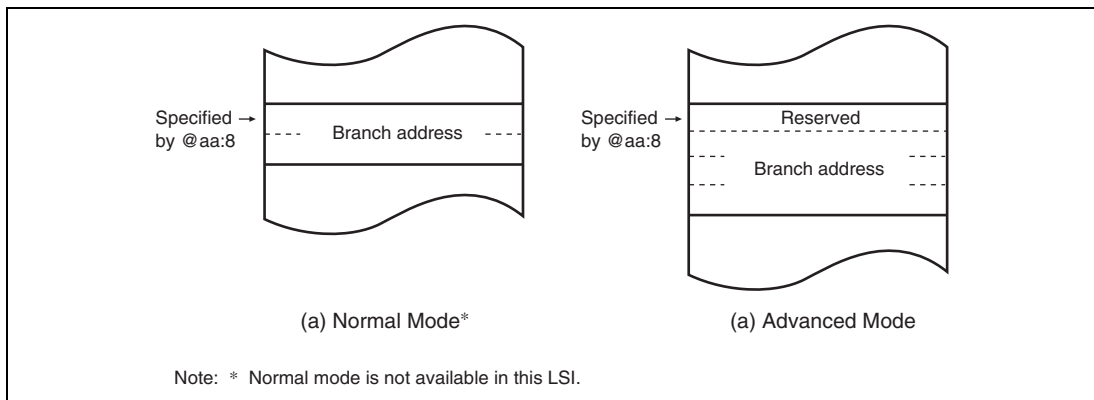

## 2.7.8 Memory Indirect—@@aa:8

This mode can be used by the JMP and JSR instructions. The instruction code contains an 8-bit absolute address specifying a memory operand. This memory operand contains a branch address. The upper bits of the absolute address are all assumed to be 0, so the address range is 0 to 255 (H'0000 to H'00FF in normal mode, H'000000 to H'0000FF in advanced mode).

In normal mode the memory operand is a word operand and the branch address is 16 bits long. In advanced mode the memory operand is a longword operand, the first byte of which is assumed to be all 0 (H'00). Note that the first part of the address range is also the exception vector area. For further details, refer to section 4, Exception Handling.

If an odd address is specified in word or longword memory access, or as a branch address, the least significant bit is regarded as 0, causing data to be accessed or instruction code to be fetched at the address preceding the specified address. (For further information, see section 2.5.2, Memory Data Formats.)

Note: Normal mode is not available in this LSI.

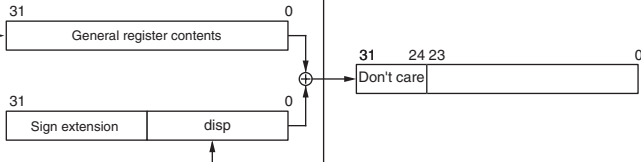

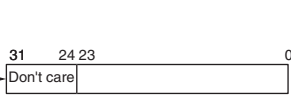

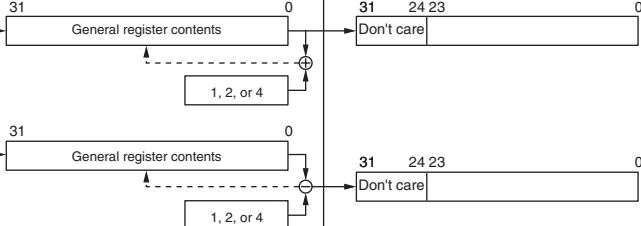

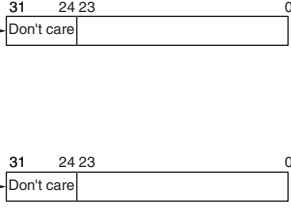

**Figure 2.12 Branch Address Specification in Memory Indirect Mode**

## 2.7.9 Effective Address Calculation

Table 2.13 indicates how effective addresses are calculated in each addressing mode. In normal mode the upper 8 bits of the effective address are ignored in order to generate a 16-bit address.

Note: Normal mode is not available in this LSI.

**Table 2.13 Effective Address Calculation (1)**

| No           | Addressing Mode and Instruction Format  | Effective Address Calculation  | Effective Address (EA)   |        |      |   |      |   |          |   |   |
|--------------|---|--|--|--------|------|---|------|---|----------|---|---|

|    | • Advanced mode<br>                                  |                               |                            |

Note: \* Normal mode is not available in this LSI.

## 2.8 Processing States

The H8S/2600 CPU has five main processing states: the reset state, exception handling state, program execution state, bus-released state, and program stop state. Figure 2.13 indicates the state transitions.

- Reset State

The CPU and on-chip peripheral modules are all initialized and stop. When the  $\overline{\text{RES}}$  input goes low, all current processing stops and the CPU enters the reset state. All interrupts are masked in the reset state. Reset exception handling starts when the  $\overline{\text{RES}}$  signal changes from low to high. For details, refer to section 4, Exception Handling.

The reset state can also be entered by a watchdog timer overflow.

- Exception-Handling State

The exception-handling state is a transient state that occurs when the CPU alters the normal processing flow due to an exception source, such as, a reset, trace, interrupt, or trap instruction. The CPU fetches a start address (vector) from the exception vector table and branches to that address. For further details, refer to section 4, Exception Handling.

- Program Execution State

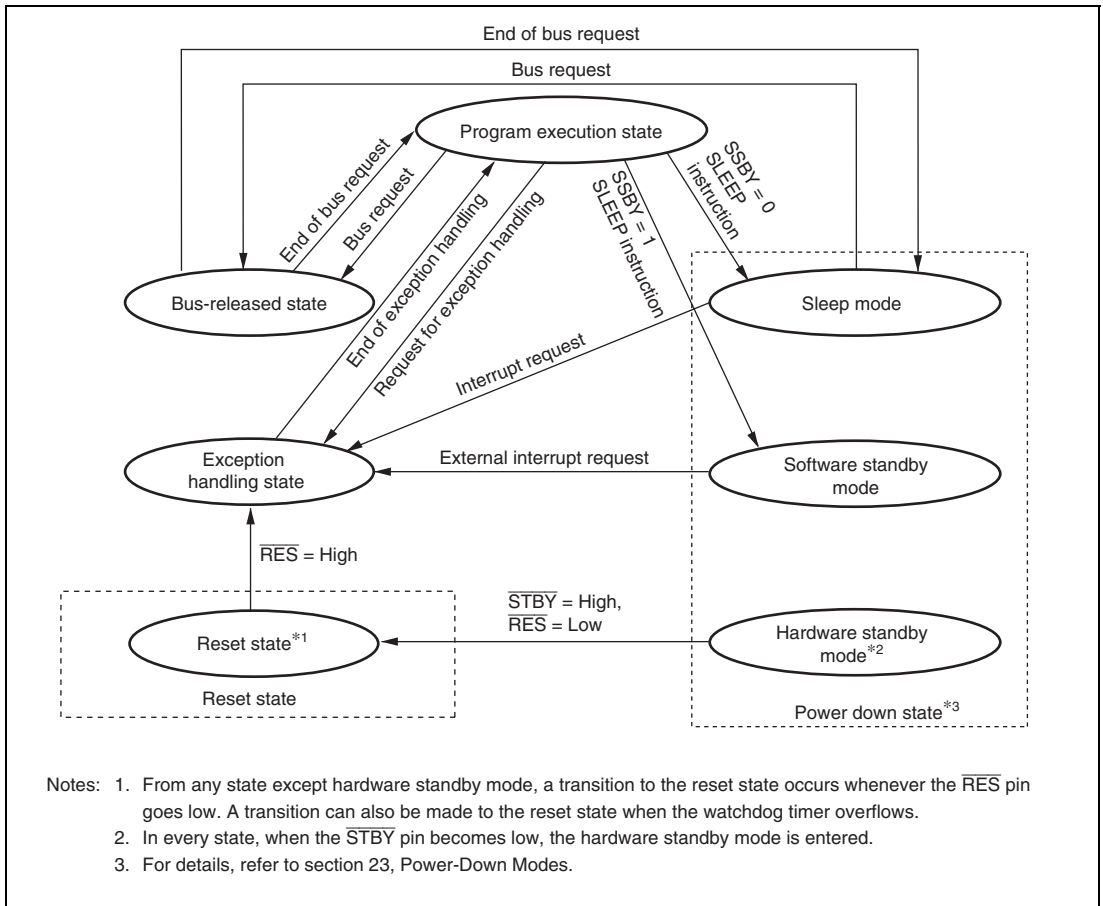

In this state the CPU executes program instructions in sequence.

- Bus-Released State

In a product which has a bus master other than the CPU, such as a direct memory access controller (DMAC) and a data transfer controller (DTC), the bus-released state occurs when the bus has been released in response to a bus request from a bus master other than the CPU. While the bus is released, the CPU halts operations.

- Program stop state

This is a power-down state in which the CPU stops operating. The program stop state occurs when a SLEEP instruction is executed or the CPU enters hardware standby mode. For further details, refer to section 23, Power-Down Modes.

**Figure 2.13 State Transitions**

## 2.9 Usage Note

### 2.9.1 Usage Notes on Bit-wise Operation Instructions

The BSET, BCLR, BNOT, BST, and BIST instructions are used to read data in byte-wise, operate the data in bit-wise, and write the result of the bit-wise operation in bit-wise again. Therefore, special care is necessary to use these instructions for the registers and the ports that include write-only bit.

The BCLR instruction can be used to clear the flags in the internal I/O registers to 0. In this time, if it is obvious that the flag has been set to 1 in the interrupt handler, there is no need to read the flag beforehand.

## Section 3 MCU Operating Modes

### 3.1 Operating Mode Selection

The H8S/2426 Group, H8S/2426R Group, and H8S/2424 Group have five operating modes (modes 1 to 4 and 7). The operating mode is selected by the setting of mode pins (MD2 to MD0).

Modes 1, 2, and 4 are externally expanded modes in which the CPU can access an external memory and peripheral devices. In an externally expanded mode, the external address space can be designated as an 8-bit or 16-bit address space for each area by the bus controller at the beginning of program execution. If a 16-bit address space is designated for any one area, the 16-bit bus mode is selected. If an 8-bit address space is designated for all areas, the 8-bit bus mode is selected.

Mode 7 is a single-chip activation expanded mode in which the CPU can switch to access an external memory and peripheral devices at the beginning of program execution.

Mode 3 is a boot mode in which the flash memory can be programmed or erased. For details on the boot mode, refer to section 21, Flash Memory.

The settings for pins MD2 to MD0 should not be changed during LSI operation.

**Table 3.1 MCU Operating Modes**

| MCU Operating Mode | MD2 | MD1 | MD0 | CPU Operating Mode | Description                             | On-Chip ROM | External Data Bus |            |
|--------------------|-----|-----|-----|--------------------|---|-------------|-------------------|------------|
|                    |     |     |     |                    |   |             | Initial Value     | Max. Value |
| 1*                 | 0   | 0   | 1   | Advanced           | Expanded mode with on-chip ROM disabled | Disabled    | 16 bits           | 16 bits    |
| 2*                 | 0   | 1   | 0   | Advanced           | Expanded mode with on-chip ROM disabled | Disabled    | 8 bits            | 16 bits    |
| 3                  | 0   | 1   | 1   | Advanced           | Boot mode                               | Enabled     | —                 | 16 bits    |
| 4                  | 1   | 0   | 0   | Advanced           | Expanded mode with on-chip ROM enabled  | Enabled     | 8 bits            | 16 bits    |
| 7                  | 1   | 1   | 1   | Advanced           | Single-chip mode                        | Enabled     | —                 | 16 bits    |

Note: \* Only modes 1 and 2 may be used in ROM-less versions.

## 3.2 Register Descriptions

The following registers are related to operating mode setting.

- Mode control register (MDCR)
- System control register (SYSCR)

### 3.2.1 Mode Control Register (MDCR)

MDCR monitors the current operating mode of this LSI.

| Bit    | Bit Name | Initial Value | R/W | Descriptions  |
|--------|----------|---------------|-----|---|
| 7 to 3 | —        | All 0         | —   | Reserved<br>These bits are always read as 0 and cannot be modified.   |
| 2      | MDS2     | —*            | R   | Mode Select 2 to 0  |
| 1      | MDS1     | —*            | R   | These bits indicate the input levels at mode pins MD2 to MD0 (the current operating mode). Bits MDS2 to MDS0 correspond to pins MD2 to MD0, respectively. These bits are read-only bits and so they cannot be modified. The input levels of the MD2 to MD0 pins are latched into these bits when MDCR is read. These latches are canceled by a reset. |
| 0      | MDS0     | —*            | R   |   |

Note: \* Determined by the settings of pins MD2 to MD0.

### 3.2.2 System Control Register (SYSCR)

SYSCR selects saturation operation for the MAC instruction, controls CPU access to the flash memory control registers, sets the external bus mode, and enables or disables on-chip RAM.

| Bit  | Bit Name | Initial Value | R/W | Descriptions   |
|------|----------|---------------|-----|--|
| 7, 6 | —        | All 1         | R/W | Reserved<br>The initial value should not be modified.  |
| 5    | MACS     | 0             | R/W | MAC Saturation Operation Control<br>Selects either saturation operation or non-saturation operation for the MAC instruction.<br>0: MAC instruction performs non-saturation operation<br>1: MAC instruction performs saturation operation |

| Bit | Bit Name | Initial Value | R/W | Descriptions  |
|-----|----------|---------------|-----|---|
| 4   | —        | 0             | R/W | Reserved<br>The initial value should not be modified.   |
| 3   | FLSHE    | 0             | R/W | Flash Memory Control Register Enable<br>Controls CPU access to the flash memory control registers (FLMCR1, FLMDBPR, and FLMSTR). If this bit is set to 1, the flash memory control registers can be read from and written to. If this bit is cleared to 0, the flash memory control registers are not selected. At this time, the contents of the flash memory control registers are retained. 0 should be written to this bit in LSIs other than the flash memory version.<br>0: Flash memory control registers are not selected for addresses H'FFFEB0 to H'FFFEB3<br>1: Flash memory control registers are selected for addresses H'FFFEB0 to H'FFFEB3 |
| 2   | —        | 0             | —   | Reserved<br>This bit is always read as 0 and cannot be modified.  |
| 1   | EXPE     | —             | R/W | External Bus Mode Enable<br>Sets the external bus mode. In modes 1, 2, and 4, this bit is fixed at 1 and cannot be modified. In modes 3 and 7, this bit can be read from and written to. Writing 0 to this bit when its value is 1 should only be carried out when an external bus cycle is not being executed.<br>0: External address space is disabled<br>1: External address space is enabled  |
| 0   | RAME     | 1             | R/W | RAM Enable<br>Enables or disables the on-chip RAM. This bit is initialized when the reset state is canceled.<br>0: On-chip RAM is disabled<br>1: On-chip RAM is enabled   |

## 3.3 Operating Mode Descriptions

### 3.3.1 Mode 1

The CPU can access a 16-Mbyte address space in advanced mode. The on-chip ROM is disabled.

Ports A to C function as an address bus, ports D and E function as a data bus, and parts of ports F to H function as bus control signals.

The initial bus mode immediately after a reset is 16 bits, with 16-bit access to all areas. However, if 8-bit access is designated for all areas by the bus controller, the bus mode switches to 8 bits.

### 3.3.2 Mode 2

The CPU can access a 16-Mbyte address space in advanced mode. The on-chip ROM is disabled.

Ports A to C function as an address bus, ports D and E function as a data bus, and parts of ports F to H function as bus control signals.

The initial bus mode immediately after a reset is 8 bits, with 8-bit access to all areas. However, if 16-bit access is designated for any one of the areas by the bus controller, the bus mode switches to 16 bits and port E functions as a data bus.

### 3.3.3 Mode 3

This mode is a boot mode of the flash memory. This mode is the same as mode 7, except for the programming and erasure of the flash memory. Mode 3 is only available in the flash memory version.

### 3.3.4 Mode 4

The CPU can access a 16-Mbyte address space in advanced mode. The on-chip ROM is enabled. The program in the on-chip ROM connected to the first half of area 0 is executed.

Ports A to C function as input ports immediately after a reset, but can be set to function as an address bus depending on each port register setting. Port D functions as a data bus and parts of ports F to H function as bus control signals. For details on function switching of ports A to C, see section 10, I/O Ports.

The initial bus mode immediately after a reset is 8 bits, with 8-bit access to all areas. However, if 16-bit access is designated for any one of the areas by the bus controller, the bus mode switches to 16 bits and port E functions as a data bus.

In the flash memory version, user program mode is entered by clearing the CBIDB bit to 0 and setting the FMCMDEN bit to 1 in FLMCR1.

### 3.3.5 Mode 7

The CPU can access a 16-Mbyte address space in advanced mode. The on-chip ROM is enabled, and the LSI starts up in single-chip mode. External address spaces cannot be used in single-chip mode.

The initial mode immediately after a reset is single-chip mode, with all I/O ports available for use as input/output ports. However, setting the EXPE bit in SYSCR to 1 switches the mode to an externally expanded mode in which the external address spaces are enabled. When an externally expanded mode is selected, all areas are initially designated as a 16-bit access space. The functions of pins in ports A to H are the same as those in an externally expanded mode with on-chip ROM enabled.

In the flash memory version, user program mode is entered by clearing the CBIDB bit to 0 and setting the FMCMDEN bit to 1 in FLMCR1.

### 3.3.6 Pin Functions

Table 3.2 shows the pin functions in each operating mode.

**Table 3.2 Pin Functions in Each Operating Mode**

| Port   |                       | Mode 1 | Mode 2 | Mode 3 | Mode 4 | Mode 7 |
|--------|-----------------------|--------|--------|--------|--------|--------|
| Port A | PA7 to PA5            | P*/A   | P*/A   | P*/A   | P*/A   | P*/A   |
|        | PA4 to PA0            | A      | A      |        |        |        |
| Port B |                       | A      | A      | P*/A   | P*/A   | P*/A   |
| Port C |                       | A      | A      | P*/A   | P*/A   | P*/A   |
| Port D |                       | D      | D      | P*/D   | D      | P*/D   |
| Port E |                       | P/D*   | P*/D   | P*/D   | P*/D   | P*/D   |
| Port F | PF7, PF6              | P/C*   | P/C*   | P*/C   | P/C*   | P*/C   |
|        | PF5, PF4              | C      | C      |        | C      |        |
|        | PF3                   | P/C*   | P/C*   |        | P/C*   |        |
|        | PF2 to PF0            | P*/C   | P*/C   |        | P*/C   |        |
| Port G | PG6 to PG1            | P*/C   | P*/C   | P*/C   | P*/C   | P*/C   |
|        | PG0                   | P/C*   | P/C*   |        |        |        |
| Port H | PH3, PH2              | P*/C   | P*/C   | P*/C   | P*/C   | P*/C   |
|        | PH1 (H8S/2426R Group) | P/C*   | P/C*   | P/C*   | P/C*   | P/C*   |
|        | PH1 (H8S/2426 Group)  | P*/C   | P*/C   | P*/C   | P*/C   | P*/C   |
|        | PH0                   | P*/C   | P*/C   | P*/C   | P*/C   | P*/C   |

[Legend]

- P: I/O port
- A: Address bus output
- D: Data bus input/output
- C: Control signals, clock input/output
- \*: Immediately after a reset

Note: Port H is not supported in the H8S/2424 Group.

### 3.4 Memory Map in Each Operating Mode

Figures 3.1 to 3.5 show memory maps in each operating mode.

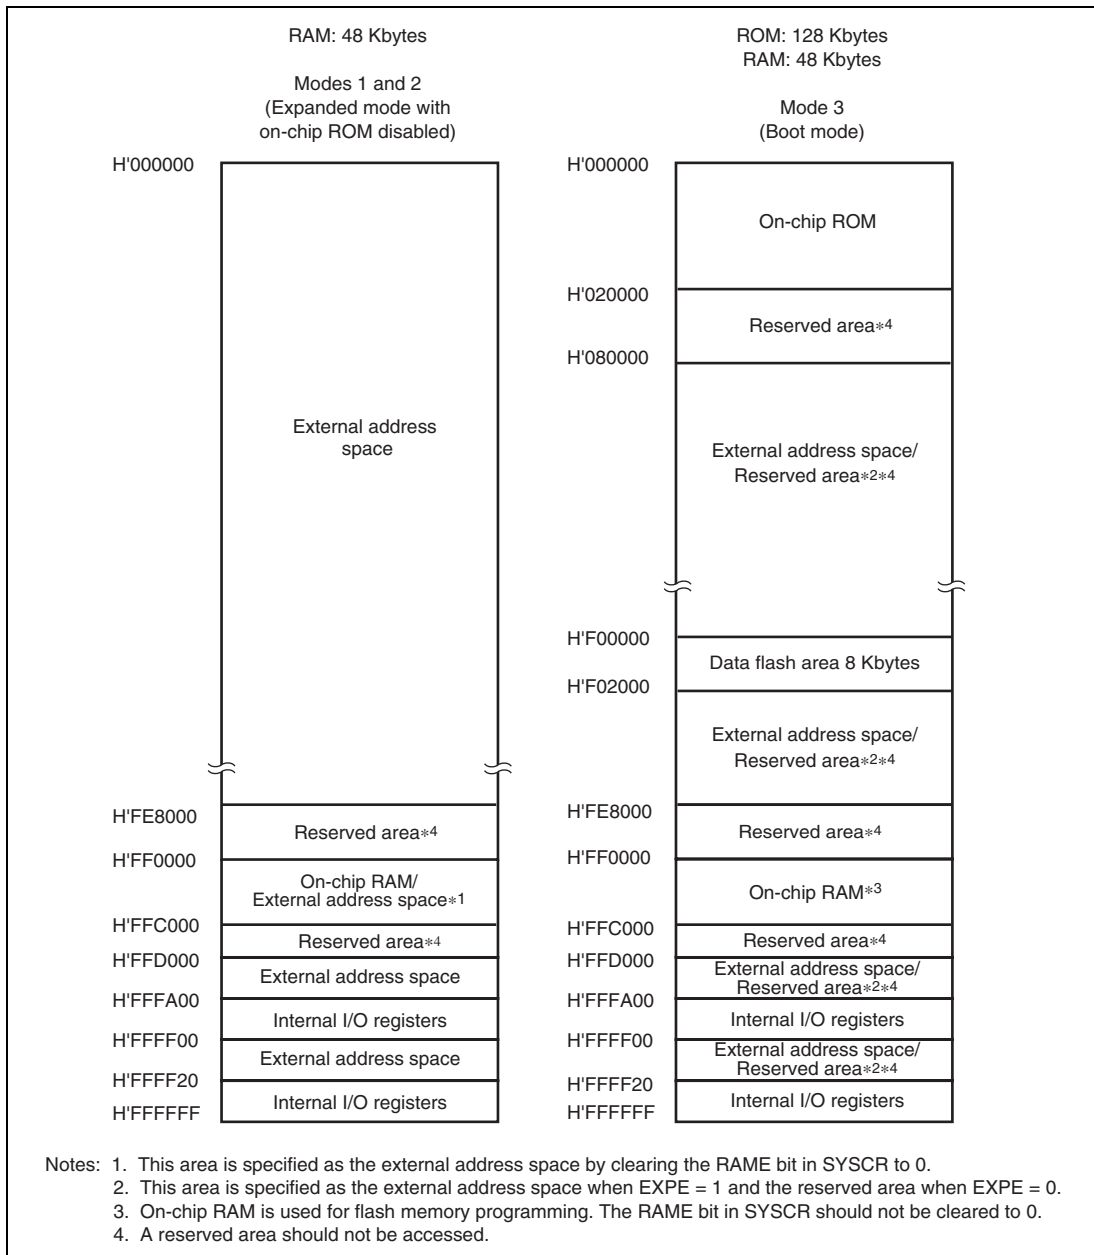

**Figure 3.1 Memory Map in Each Operating Mode (ROM: 256-Kbyte Version):  
H8S/24269, H8S/24269R, H8S/24268, H8S/24268R, H8S/24249, and H8S/24248**

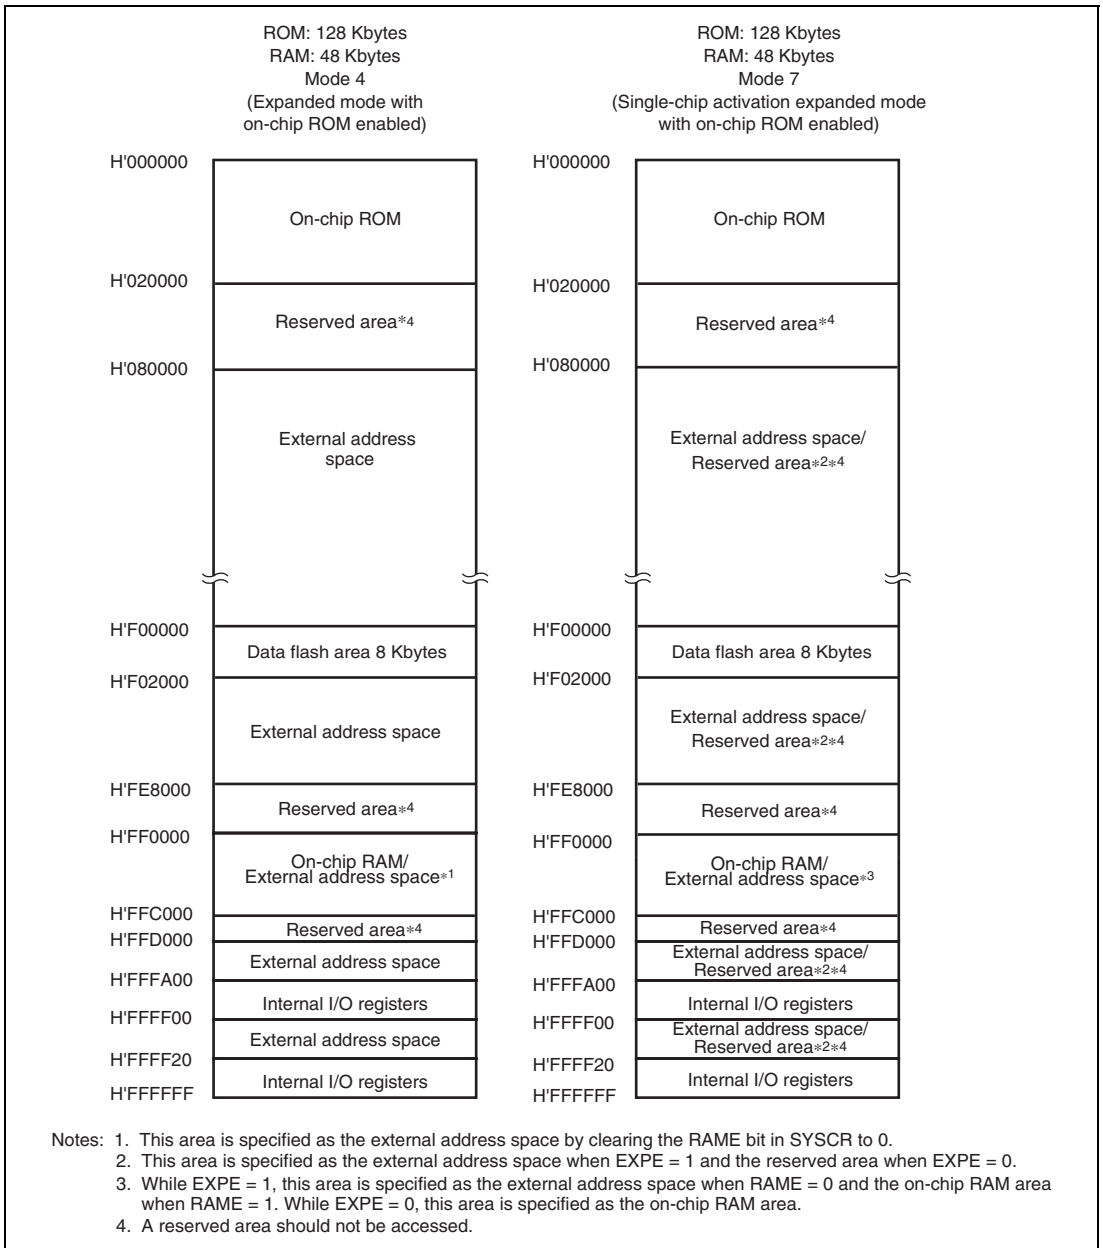

**Figure 3.2 Memory Map in Each Operating Mode (ROM: 256-Kbyte Version):  
H8S/24269, H8S/24269R, H8S/24268, H8S/24268R, H8S/24249, and H8S/24248**

**Figure 3.3 Memory Map in Each Operating Mode (ROM: 128-Kbyte Version):  
 H8S/24265, H8S/24265R, and H8S/24245**

**Figure 3.4 Memory Map in Each Operating Mode (ROM: 128-Kbyte Version):  
H8S/24265, H8S/24265R, and H8S/24245**

RAM: 64 Kbytes /48 Kbytes

Modes 1 and 2  
(Expanded mode with  
on-chip ROM disabled)

- Notes:
1. This area is specified as the external address space by clearing the RAME bit in SYSCR to 0.
  2. A reserved area should not be accessed.
  3. Area from H'FEC000 to H'FFFFFF in the H8S/24261, H8S/24261R, and H8S/24241 Groups is reserved and should not be accessed.

**Figure 3.5 Memory Map in Each Operating Mode (ROM-Less Version):  
H8S/24262, H8S/24262R, H8S/24261, H8S/24261R, H8S/24242, and H8S/24241**

## Section 4 Exception Handling

### 4.1 Exception Handling Types and Priority

As table 4.1 indicates, exception handling may be caused by a reset, trace, interrupt, illegal instruction, or trap instruction. Exception handling is prioritized as shown in table 4.1. If two or more exceptions occur simultaneously, they are accepted and processed in order of priority. Exception sources, the stack structure, and operation of the CPU vary depending on the interrupt control mode. For details on the interrupt control mode, refer to section 5, Interrupt Controller.

**Table 4.1 Exception Types and Priority**

| Priority  | Exception Type                  | Start of Exception Handling   |
|-----------|---------------------------------|---|
| High<br>↑ | Reset                           | Starts immediately after a low-to-high transition at the $\overline{\text{RES}}$ pin, or when the watchdog timer overflows. The CPU enters the reset state when the $\overline{\text{RES}}$ pin is low. |
|           | Illegal instruction             | Starts when execution of an illegal instruction code is detected.   |
|           | Trace* <sup>1</sup>             | Starts when execution of the currently executed instruction or exception handling ends, if the trace (T) bit in the EXR is set to 1.  |
|           | Direct transition* <sup>2</sup> | Starts when the direct transition occurs by execution of the SLEEP instruction.   |
|           | Interrupt                       | Starts when execution of the current instruction or exception handling ends, if an interrupt request has been issued. * <sup>3</sup>  |
| Low       | Trap instruction* <sup>4</sup>  | Started by execution of a trap instruction (TRAPA)  |

Notes: 1. Traces are enabled only in interrupt control mode 2. Trace exception handling is not executed after execution of an RTE instruction.  
 2. Not available in this LSI.  
 3. Interrupt detection is not performed on completion of ANDC, ORC, XORC, or LDC instruction execution, or on completion of reset exception handling.  
 4. Trap instruction exception handling requests are accepted at all times in program execution state.

## 4.2 Exception Sources and Exception Vector Table

Different vector addresses are assigned to different exception sources. Table 4.2 lists the exception sources and their vector addresses. Since the usable modes differ depending on the product, for details on each product, refer to section 3, MCU Operating Modes.

**Table 4.2 Exception Handling Vector Table**

| Exception Source                            | Vector Number | Vector Address* <sup>1</sup> |                  |                  |
|---|---------------|------------------------------|------------------|------------------|
|   |               | Normal Mode* <sup>2</sup>    | Advanced Mode    |                  |
| Power-on reset                              | 0             | H'0000 to H'0001             | H'0000 to H'0003 |                  |
| Manual reset* <sup>3</sup>                  | 1             | H'0002 to H'0003             | H'0004 to H'0007 |                  |
| Reserved for system use                     | 2             | H'0004 to H'0005             | H'0008 to H'000B |                  |
|   | 3             | H'0006 to H'0007             | H'000C to H'000F |                  |
| Illegal instruction                         | 4             | H'0008 to H'0019             | H'0010 to H'0013 |                  |
| Trace                                       | 5             | H'000A to H'000B             | H'0014 to H'0017 |                  |
| Interrupt (direct transition)* <sup>3</sup> | 6             | H'000C to H'000D             | H'0018 to H'001B |                  |
| Interrupt (NMI)                             | 7             | H'000E to H'000F             | H'001C to H'001F |                  |
| Trap instruction (#0)                       | 8             | H'0010 to H'0011             | H'0020 to H'0023 |                  |
|   | (#1)          | 9                            | H'0012 to H'0013 | H'0024 to H'0027 |
|   | (#2)          | 10                           | H'0014 to H'0015 | H'0028 to H'002B |
|   | (#3)          | 11                           | H'0016 to H'0017 | H'002C to H'002F |
| Reserved for system use                     | 12            | H'0018 to H'0019             | H'0030 to H'0033 |                  |
|   | 13            | H'001A to H'001B             | H'0034 to H'0037 |                  |
|   | 14            | H'001C to H'001D             | H'0038 to H'003B |                  |
|   | 15            | H'001E to H'001F             | H'003C to H'003F |                  |
| External interrupt                          | IRQ0          | 16                           | H'0020 to H'0021 | H'0040 to H'0043 |
|   | IRQ1          | 17                           | H'0022 to H'0023 | H'0044 to H'0047 |
|   | IRQ2          | 18                           | H'0024 to H'0025 | H'0048 to H'004B |
|   | IRQ3          | 19                           | H'0026 to H'0027 | H'004C to H'004F |
|   | IRQ4          | 20                           | H'0028 to H'0029 | H'0050 to H'0053 |
|   | IRQ5          | 21                           | H'002A to H'002B | H'0054 to H'0057 |
|   | IRQ6          | 22                           | H'002C to H'002D | H'0058 to H'005B |

| Exception Source                 | Vector Number       | Vector Address* <sup>1</sup> |                  |                  |
|----------------------------------|---------------------|------------------------------|------------------|------------------|
|                                  |                     | Normal Mode* <sup>2</sup>    | Advanced Mode    |                  |
| External interrupt               | IRQ7                | 23                           | H'002E to H'002F | H'005C to H'005F |
|                                  | IRQ8* <sup>5</sup>  | 24                           | H'0030 to H'0031 | H'0060 to H'0063 |
|                                  | IRQ9* <sup>5</sup>  | 25                           | H'0032 to H'0033 | H'0064 to H'0067 |
|                                  | IRQ10* <sup>5</sup> | 26                           | H'0034 to H'0035 | H'0068 to H'006B |
|                                  | IRQ11* <sup>5</sup> | 27                           | H'0036 to H'0037 | H'006C to H'006F |
|                                  | IRQ12* <sup>5</sup> | 28                           | H'0038 to H'0039 | H'0070 to H'0073 |
| External interrupt               | IRQ13* <sup>5</sup> | 29                           | H'003A to H'003B | H'0074 to H'0077 |

- Notes:
1. Lower 16 bits of the address.
  2. Not available in this LSI.
  3. Not available in this LSI. It is reserved for system use.
  4. For details of internal interrupt vectors, see section 5.5, Interrupt Exception Handling Vector Table.
  5. Reserved for system use in the H8S/2424 Group.

## 4.3 Reset

A reset has the highest exception priority. When the  $\overline{\text{RES}}$  pin goes low, all processing halts and this LSI enters the reset. To ensure that this LSI is reset, hold the  $\overline{\text{RES}}$  pin low for at least 20 ms at power-up. To reset this LSI during operation, hold the  $\overline{\text{RES}}$  pin low for at least 20 states. A reset initializes the internal state of the CPU and the registers of on-chip peripheral modules. This LSI can also be reset by overflow of the watchdog timer. For details see section 14, Watchdog Timer (WDT). The interrupt control mode is 0 immediately after reset.

### 4.3.1 Reset Exception Handling

When the  $\overline{\text{RES}}$  pin goes high after being held low for the necessary time, this LSI starts reset exception handling as follows:

1. The internal state of the CPU and the registers of the on-chip peripheral modules are initialized, the T bit is cleared to 0 in EXR, and the I bit is set to 1 in EXR and CCR.
2. The reset exception handling vector address is read and transferred to the PC, and program execution starts from the address indicated by the PC.

Figures 4.1 and 4.2 show examples of the reset sequence.

**Figure 4.1 Reset Sequence (Advanced Mode with On-chip ROM Enabled)**

**Figure 4.2 Reset Sequence (Advanced Mode with On-chip ROM Disabled)**

### 4.3.2 Interrupts after Reset

If an interrupt is accepted after a reset but before the stack pointer (SP) is initialized, the PC and CCR will not be saved correctly, leading to a program crash. To prevent this, all interrupt requests, including NMI, are disabled immediately after a reset. Since the first instruction of a program is always executed immediately after the reset state ends, make sure that this instruction initializes the stack pointer (example: `MOV.L #xx, SP`).

### 4.3.3 On-Chip Peripheral Functions after Reset Release

After reset release, MSTPCR is initialized to H'0FFF, EXMSTPCR is initialized to H'FFFF, and all modules except the DMAC, EXDMAC, and DTC enter the module stop state.

Consequently, on-chip peripheral module registers cannot be read or written to. Register reading and writing is enabled when the module stop state is exited.

## 4.4 Trace Exception Handling

Traces are enabled in interrupt control mode 2. Trace mode is not activated in interrupt control mode 0, irrespective of the state of the T bit. For details on interrupt control modes, see section 5, Interrupt Controller.

If the T bit in EXR is set to 1, trace mode is activated. In trace mode, a trace exception occurs on completion of each instruction. Trace mode is not affected by interrupt masking. Table 4.3 shows the state of CCR and EXR after execution of trace exception handling. Trace mode is canceled by clearing the T bit in EXR to 0. The T bit saved on the stack retains its value of 1, and when control is returned from the trace exception handling routine by the RTE instruction, trace mode resumes. Trace exception handling is not carried out after execution of the RTE instruction.

Interrupts are accepted even within the trace exception handling routine.

**Table 4.3 Status of CCR and EXR after Trace Exception Handling**

| Interrupt Control Mode | CCR                                      |    |          | EXR |
|------------------------|--|----|----------|-----|
|                        | I  | UI | I2 to I0 | T   |
| 0                      | Trace exception handling cannot be used. |    |          |     |
| 2                      | 1  | —  | —        | 0   |

[Legend]

- 1: Set to 1
- 0: Cleared to 0
- : Retains value prior to execution

## 4.5 Interrupt Exception Handling

Interrupts are controlled by the interrupt controller. The interrupt controller has two interrupt control modes and can assign interrupts other than NMI to eight priority/mask levels to enable multiplexed interrupt control. The source to start interrupt exception handling and the vector address differ depending on the product. For details, refer to section 5, Interrupt Controller.

The interrupt exception handling is as follows:

1. The values in the program counter (PC), condition code register (CCR), and extended register (EXR) are saved in the stack.
2. The interrupt mask bit is updated and the T bit is cleared to 0.
3. A vector address corresponding to the interrupt source is generated, the start address is loaded from the vector table to the PC, and program execution starts from that address.

## 4.6 Trap Instruction Exception Handling

Trap instruction exception handling starts when a TRAPA instruction is executed. Trap instruction exception handling can be executed at all times in the program execution state.

The trap instruction exception handling is as follows:

1. The values in the program counter (PC), condition code register (CCR), and extended register (EXR) are saved in the stack.
2. The interrupt mask bit is updated and the T bit is cleared to 0.
3. A vector address corresponding to the interrupt source is generated, the start address is loaded from the vector table to the PC, and program execution starts from that address.

The TRAPA instruction fetches a start address from a vector table entry corresponding to a vector number from 0 to 3, as specified in the instruction code.

Table 4.4 shows the status of CCR and EXR after execution of trap instruction exception handling.

**Table 4.4 Status of CCR and EXR after Trap Instruction Exception Handling**

| Interrupt Control Mode | CCR |    |          | EXR |
|------------------------|-----|----|----------|-----|
|                        | I   | UI | I2 to I0 | T   |
| 0                      | 1   | —  | —        | —   |
| 2                      | 1   | —  | —        | 0   |

Legend:

1: Set to 1

0: Cleared to 0

—: Retains value prior to execution

## 4.7 Illegal Instruction Exception Handling

Illegal instruction exception handling starts when the CPU executing an illegal instruction code is detected. Illegal instruction exception handling can be executed at all times in the program execution state.

The illegal instruction exception handling is as follows:

1. The values in the PC, CCR, and EXR are saved in the stack.
2. The interrupt mask bit is updated and the T bit is cleared to 0.
3. An exception handling vector table address corresponding to the exception is generated, the start address of the exception service routine is loaded from the vector table to the PC, and program execution starts from that address.

Table 4.5 shows the status of CCR and EXR after execution of illegal instruction exception handling.

**Table 4.5 Status of CCR and EXR after Illegal Instruction Exception Handling**

| Interrupt Control Mode | CCR |    |   | EXR      |
|------------------------|-----|----|---|----------|
|                        | I   | UI | T | I2 to I0 |
| 0                      | 1   | —  | — | —        |
| 2                      | 1   | —  | 0 | —        |

Legend:

1: Set to 1

0: Cleared to 0

—: Retains value prior to execution

Illegal instruction codes will not be searched for in the fields that do not affect instruction definitions, such as the EA extension or register fields. Instruction codes for an instruction formed with several words are detected independently, and combined instruction codes are not detected.

Undefined instruction codes must not be executed. The general register contents after execution of an undefined instruction code or illegal instruction exception handling cannot be guaranteed. The stack pointer during illegal instruction exception handling and the PC value that will be saved are also not guaranteed.

## 4.8 Stack Status after Exception Handling

Figure 4.3 shows the stack after completion of trap instruction exception handling and interrupt exception handling.

**Figure 4.3 Stack Status after Exception Handling**

## 4.9 Usage Note

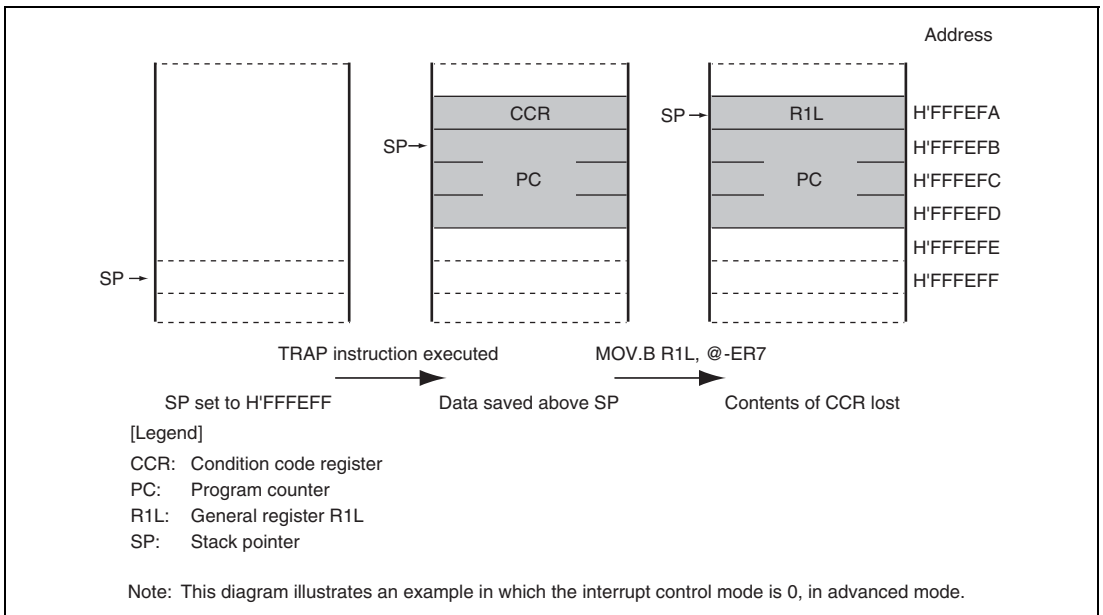

When accessing word data or longword data, this LSI assumes that the lowest address bit is 0. The stack should always be accessed by word transfer instruction or longword transfer instruction, and the value of the stack pointer (SP, ER7) should always be kept even. Use the following instructions to save registers:

```
PUSH.W   Rn    (or MOV.W Rn, @-SP)
PUSH.L   ERn   (or MOV.L ERn, @-SP)
```

Use the following instructions to restore registers:

```
POP.W    Rn    (or MOV.W @SP+, Rn)
POP.L    ERn   (or MOV.L @SP+, ERn)
```

Setting SP to an odd value may lead to a malfunction. Figure 4.4 shows an example of operation when the SP value is odd.

**Figure 4.4 Operation when SP Value Is Odd**

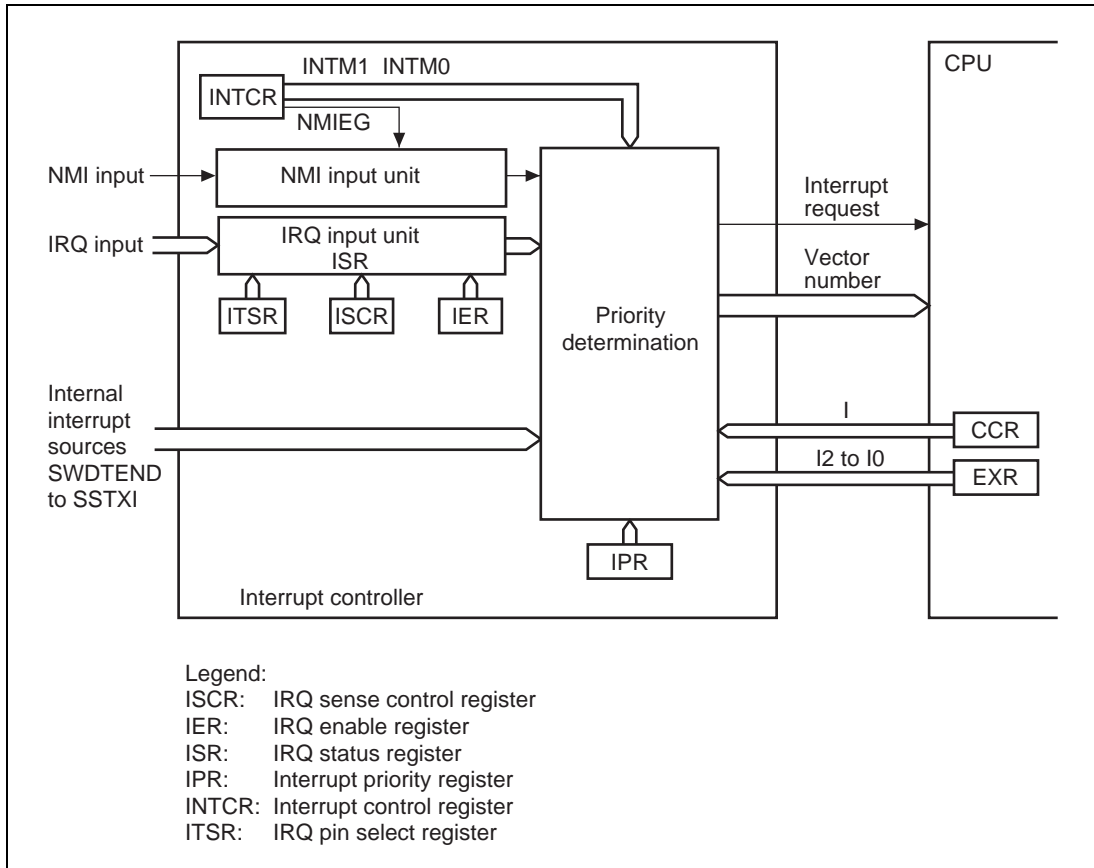

## Section 5 Interrupt Controller

### 5.1 Features

- Two interrupt control modes  
Any of two interrupt control modes can be set by means of the INTM1 and INTM0 bits in the interrupt control register (INTCR).
- Priorities settable with IPR  
An interrupt priority register (IPR) is provided for setting interrupt priorities. Eight priority levels can be set for each module for all interrupts except NMI. NMI is assigned the highest priority level of 8, and can be accepted at all times.
- Independent vector addresses  
All interrupt sources are assigned independent vector addresses, making it unnecessary for the source to be identified in the interrupt handling routine.
- External interrupt pins  
NMI is the highest-priority interrupt, and is accepted at all times. Rising edge or falling edge can be selected for NMI. Falling edge, rising edge, or both edge detection, or level sensing, can be selected for  $\overline{\text{IRQn-A}}$  and  $\overline{\text{IRQn-B}}$ .  
Note:  $n = 15$  to  $0$  for H8S/2426 Group,  $n = 7$  to  $0$  for H8S/2424 Group
- DTC and DMAC control  
DTC and DMAC activations are performed by means of interrupts.

A block diagram of the interrupt controller is shown in figure 5.1.

**Figure 5.1 Block Diagram of Interrupt Controller**

## 5.2 Input/Output Pins

Table 5.1 shows the pin configuration of the interrupt controller.

**Table 5.1 Pin Configuration**

| <b>Name</b>   | <b>I/O</b> | <b>Function</b>   |
|---|------------|---|
| NMI   | Input      | Nonmaskable external interrupt<br>Rising or falling edge can be selected. |
| $\overline{\text{IRQ15-A}}$ to $\overline{\text{IRQ0-A}}$ * | Input      | Maskable external interrupts  |
| $\overline{\text{IRQ15-B}}$ to $\overline{\text{IRQ0-B}}$ * |            | Rising, falling, or both edges, or level sensing, can be selected.        |

Note: \*  $\overline{\text{IRQ7-A}}$  to  $\overline{\text{IRQ0-A}}$  and  $\overline{\text{IRQ7-B}}$  to  $\overline{\text{IRQ0-B}}$  in the H8S/2424 Group.

## 5.3 Register Descriptions

The interrupt controller has the following registers.

- Interrupt control register (INTCR)
- IRQ sense control register H (ISCRH)
- IRQ sense control register L (ISCR L)
- IRQ enable register (IER)
- IRQ status register (ISR)
- IRQ pin select register (ITSR)
- Software standby release IRQ enable register (SSIER)
- Interrupt priority register A (IPRA)
- Interrupt priority register B (IPRB)
- Interrupt priority register C (IPRC)
- Interrupt priority register D (IPRD)
- Interrupt priority register E (IPRE)
- Interrupt priority register F (IPRF)
- Interrupt priority register G (IPRG)
- Interrupt priority register H (IPRH)
- Interrupt priority register I (IPRI)
- Interrupt priority register J (IPRJ)
- Interrupt priority register K (IPRK)
- Interrupt priority register L (IPRL)
- Interrupt priority register M (IPRM)
- Interrupt priority register N (IPRN)

### 5.3.1 Interrupt Control Register (INTCR)

INTCR selects the interrupt control mode, and the detected edge for NMI.

| Bit    | Bit Name | Initial Value | R/W | Description  |
|--------|----------|---------------|-----|--|
| 7, 6   | —        | All 0         | —   | Reserved<br>These bits are always read as 0 and the initial value should not be changed.   |
| 5      | INTM1    | 0             | R/W | Interrupt Control Select Mode 1 and 0  |
| 4      | INTM0    | 0             | R/W | These bits select either of two interrupt control modes for the interrupt controller.<br>00: Interrupt control mode 0<br>Interrupts are controlled by I bit.<br>01: Setting prohibited.<br>10: Interrupt control mode 2<br>Interrupts are controlled by bits I2 to I0, and IPR.<br>11: Setting prohibited. |
| 3      | NMIEG    | 0             | R/W | NMI Edge Select<br>Selects the input edge for the NMI pin.<br>0: Interrupt request generated at falling edge of NMI input<br>1: Interrupt request generated at rising edge of NMI input  |
| 2 to 0 | —        | All 0         | —   | Reserved<br>These bits are always read as 0 and the initial value should not be changed.   |

### 5.3.2 Interrupt Priority Registers A to N (IPRA to IPRN)

IPR are eleven 16-bit readable/writable registers that set priorities (levels 7 to 0) for interrupts other than NMI.

The correspondence between interrupt sources and IPR settings is shown in table 5.2 (Interrupt Sources, Vector Addresses, and Interrupt Priorities). Setting a value in the range from H'0 to H'7 in the 3-bit groups of bits 14 to 12, 10 to 8, 6 to 4, and 2 to 0 sets the priority of the corresponding interrupt. IPR should be read in word size.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 15  | —        | 0             | —   | Reserved<br>This bit is always read as 0 and the initial value should not be changed.   |
| 14  | IPR14    | 1             | R/W | Sets the priority of the corresponding interrupt source.  |
| 13  | IPR13    | 1             | R/W |   |
| 12  | IPR12    | 1             | R/W | 000: Priority level 0 (Lowest)<br>001: Priority level 1<br>010: Priority level 2<br>011: Priority level 3<br>100: Priority level 4<br>101: Priority level 5<br>110: Priority level 6<br>111: Priority level 7 (Highest) |
| 11  | —        | 0             | —   | Reserved<br>This bit is always read as 0 and the initial value should not be changed.   |
| 10  | IPR10    | 1             | R/W | Sets the priority of the corresponding interrupt source.  |
| 9   | IPR9     | 1             | R/W |   |
| 8   | IPR8     | 1             | R/W | 000: Priority level 0 (Lowest)<br>001: Priority level 1<br>010: Priority level 2<br>011: Priority level 3<br>100: Priority level 4<br>101: Priority level 5<br>110: Priority level 6<br>111: Priority level 7 (Highest) |

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | —        | 0             | —   | Reserved<br>This bit is always read as 0 and the initial value should not be changed.   |
| 6   | IPR6     | 1             | R/W | Sets the priority of the corresponding interrupt source.  |
| 5   | IPR5     | 1             | R/W |   |
| 4   | IPR4     | 1             | R/W | 000: Priority level 0 (Lowest)<br>001: Priority level 1<br>010: Priority level 2<br>011: Priority level 3<br>100: Priority level 4<br>101: Priority level 5<br>110: Priority level 6<br>111: Priority level 7 (Highest) |
| 3   | —        | 0             | —   | Reserved<br>This bit is always read as 0 and the initial value should not be changed.   |
| 2   | IPR2     | 1             | R/W | Sets the priority of the corresponding interrupt source.  |
| 1   | IPR1     | 1             | R/W |   |
| 0   | IPR0     | 1             | R/W | 000: Priority level 0 (Lowest)<br>001: Priority level 1<br>010: Priority level 2<br>011: Priority level 3<br>100: Priority level 4<br>101: Priority level 5<br>110: Priority level 6<br>111: Priority level 7 (Highest) |

### 5.3.3 IRQ Enable Register (IER)

IER controls enabling and disabling of interrupt requests IRQ15 to IRQ0.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 15  | IRQ15E   | 0             | R/W | IRQ15 Enable*<br>The IRQ15 interrupt request is enabled when this bit is 1. |
| 14  | IRQ14E   | 0             | R/W | IRQ14 Enable*<br>The IRQ14 interrupt request is enabled when this bit is 1. |
| 13  | IRQ13E   | 0             | R/W | IRQ13 Enable*<br>The IRQ13 interrupt request is enabled when this bit is 1. |
| 12  | IRQ12E   | 0             | R/W | IRQ12 Enable*<br>The IRQ12 interrupt request is enabled when this bit is 1. |
| 11  | IRQ11E   | 0             | R/W | IRQ11 Enable*<br>The IRQ11 interrupt request is enabled when this bit is 1. |
| 10  | IRQ10E   | 0             | R/W | IRQ10 Enable*<br>The IRQ10 interrupt request is enabled when this bit is 1. |
| 9   | IRQ9E    | 0             | R/W | IRQ9 Enable*<br>The IRQ9 interrupt request is enabled when this bit is 1.   |
| 8   | IRQ8E    | 0             | R/W | IRQ8 Enable*<br>The IRQ8 interrupt request is enabled when this bit is 1.   |
| 7   | IRQ7E    | 0             | R/W | IRQ7 Enable<br>The IRQ7 interrupt request is enabled when this bit is 1.    |
| 6   | IRQ6E    | 0             | R/W | IRQ6 Enable<br>The IRQ6 interrupt request is enabled when this bit is 1.    |

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 5   | IRQ5E    | 0             | R/W | IRQ5 Enable<br>The IRQ5 interrupt request is enabled when this bit is 1. |
| 4   | IRQ4E    | 0             | R/W | IRQ4 Enable<br>The IRQ4 interrupt request is enabled when this bit is 1. |
| 3   | IRQ3E    | 0             | R/W | IRQ3 Enable<br>The IRQ3 interrupt request is enabled when this bit is 1. |
| 2   | IRQ2E    | 0             | R/W | IRQ2 Enable<br>The IRQ2 interrupt request is enabled when this bit is 1. |
| 1   | IRQ1E    | 0             | R/W | IRQ1 Enable<br>The IRQ1 interrupt request is enabled when this bit is 1. |
| 0   | IRQ0E    | 0             | R/W | IRQ0 Enable<br>The IRQ0 interrupt request is enabled when this bit is 1. |

Note: \* These bits are reserved in the H8S/2424 Group.

### 5.3.4 IRQ Sense Control Registers H and L (ISCRH, ISCR L)

ISCR select the source that generates an interrupt request at pins  $\overline{\text{IRQ15}}$  to  $\overline{\text{IRQ0}}$ .

- ISCRH (H8S/2426 Group only)

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 15  | IRQ15SCB | 0             | R/W | IRQ15 Sense Control B   |
| 14  | IRQ15SCA | 0             | R/W | IRQ15 Sense Control A   |
|     |          |               |     | 00: Interrupt request generated at $\overline{\text{IRQ15}}$ input low level                        |
|     |          |               |     | 01: Interrupt request generated at falling edge of $\overline{\text{IRQ15}}$ input                  |
|     |          |               |     | 10: Interrupt request generated at rising edge of $\overline{\text{IRQ15}}$ input                   |
|     |          |               |     | 11: Interrupt request generated at both falling and rising edges of $\overline{\text{IRQ15}}$ input |
| 13  | IRQ14SCB | 0             | R/W | IRQ14 Sense Control B   |
| 12  | IRQ14SCA | 0             | R/W | IRQ14 Sense Control A   |
|     |          |               |     | 00: Interrupt request generated at $\overline{\text{IRQ14}}$ input low level                        |
|     |          |               |     | 01: Interrupt request generated at falling edge of $\overline{\text{IRQ14}}$ input                  |
|     |          |               |     | 10: Interrupt request generated at rising edge of $\overline{\text{IRQ14}}$ input                   |
|     |          |               |     | 11: Interrupt request generated at both falling and rising edges of $\overline{\text{IRQ14}}$ input |
| 11  | IRQ13SCB | 0             | R/W | IRQ13 Sense Control B   |
| 10  | IRQ13SCA | 0             | R/W | IRQ13 Sense Control A   |
|     |          |               |     | 00: Interrupt request generated at $\overline{\text{IRQ13}}$ input low level                        |
|     |          |               |     | 01: Interrupt request generated at falling edge of $\overline{\text{IRQ13}}$ input                  |
|     |          |               |     | 10: Interrupt request generated at rising edge of $\overline{\text{IRQ13}}$ input                   |
|     |          |               |     | 11: Interrupt request generated at both falling and rising edges of $\overline{\text{IRQ13}}$ input |

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|

### 5.3.5 IRQ Status Register (ISR)

ISR is an IRQ15 to IRQ0 interrupt request flag register.

| Bit | Bit Name             | Initial Value | R/W                 | Description   |
|-----|----------------------|---------------|---------------------|---|
| 15  | IRQ15F* <sup>2</sup> | 0             | R/(W)* <sup>1</sup> | [Setting condition]   |
| 14  | IRQ14F* <sup>2</sup> | 0             | R/(W)* <sup>1</sup> | When the interrupt source selected by ISCR occurs   |
| 13  | IRQ13F* <sup>2</sup> | 0             | R/(W)* <sup>1</sup> |   |
| 12  | IRQ12F* <sup>2</sup> | 0             | R/(W)* <sup>1</sup> | [Clearing conditions]   |
| 11  | IRQ11F* <sup>2</sup> | 0             | R/(W)* <sup>1</sup> | <ul style="list-style-type: none"> <li>Cleared by reading IRQnF flag when IRQnF = 1, then writing 0 to IRQnF flag</li> </ul>  |
| 10  | IRQ10F* <sup>2</sup> | 0             | R/(W)* <sup>1</sup> |   |
| 9   | IRQ9F* <sup>2</sup>  | 0             | R/(W)* <sup>1</sup> | <ul style="list-style-type: none"> <li>When interrupt exception handling is executed when low-level detection is set and <math>\overline{\text{IRQn}}</math> input is high</li> </ul> |
| 8   | IRQ8F* <sup>2</sup>  | 0             | R/(W)* <sup>1</sup> |   |
| 7   | IRQ7F                | 0             | R/(W)* <sup>1</sup> | <ul style="list-style-type: none"> <li>When IRQn interrupt exception handling is executed when falling, rising, or both-edge detection is set</li> </ul>                              |
| 6   | IRQ6F                | 0             | R/(W)* <sup>1</sup> |   |
| 5   | IRQ5F                | 0             | R/(W)* <sup>1</sup> | <ul style="list-style-type: none"> <li>When the DTC is activated by an IRQn interrupt, and the DISEL bit in MRB of the DTC is cleared to 0</li> </ul>                                 |
| 4   | IRQ4F                | 0             | R/(W)* <sup>1</sup> |   |
| 3   | IRQ3F                | 0             | R/(W)* <sup>1</sup> |   |
| 2   | IRQ2F                | 0             | R/(W)* <sup>1</sup> |   |
| 1   | IRQ1F                | 0             | R/(W)* <sup>1</sup> |   |
| 0   | IRQ0F                | 0             | R/(W)* <sup>1</sup> |   |

- Notes: 1. Only 0 can be written, to clear the flag.  
 2. These bits are reserved in the H8S/2424 Group.

### 5.3.6 IRQ Pin Select Register (ITSR)

ITSR selects input pins  $\overline{\text{IRQ15}}$  to  $\overline{\text{IRQ0}}$ .

- H8S/2426 Group

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 15  | ITS15    | 0             | R/W | Selects the $\overline{\text{IRQ15}}$ input pin.<br>0: PF2/ $\overline{\text{IRQ15-A}}$ selected<br>1: P27/ $\overline{\text{IRQ15-B}}$ selected |

### 5.3.7 Software Standby Release IRQ Enable Register (SSIER)

SSIER selects the  $\overline{\text{IRQ}}$  pins used to recover from the software standby state.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 15  | SSI15*   | 0             | R/W | Software Standby Release IRQ Setting  |
| 14  | SSI14*   | 0             | R/W | These bits select the $\overline{\text{IRQ}}_n$ pins used to recover from the software standby state.   |
| 13  | SSI13*   | 0             | R/W |   |
| 12  | SSI12*   | 0             | R/W | 0: IRQn requests are not sampled in the software standby state (Initial value when n = 15 to 3)   |
| 11  | SSI11*   | 0             | R/W | 1: When an IRQn request occurs in the software standby state, the chip recovers from the software standby state after the elapse of the oscillation settling time (Initial value when n = 2 to 0) |
| 10  | SSI10*   | 0             | R/W |   |
| 9   | SSI9*    | 0             | R/W |   |
| 8   | SSI8*    | 0             | R/W |   |
| 7   | SSI7     | 0             | R/W |   |
| 6   | SSI6     | 0             | R/W |   |
| 5   | SSI5     | 0             | R/W |   |
| 4   | SSI4     | 0             | R/W |   |
| 3   | SSI3     | 0             | R/W |   |
| 2   | SSI2     | 0             | R/W |   |
| 1   | SSI1     | 0             | R/W |   |
| 0   | SSI0     | 0             | R/W |   |

Note: \* These bits are reserved in the H8S/2424 Group.

## 5.4 Interrupt Sources

### 5.4.1 External Interrupts

The H8S/2426 Group and H8S/2426R Group each have seventeen external interrupts: NMI and IRQ15 to IRQ0. The H8S/2424 Group has nine external interrupts: NMI and IRQ7 to IRQ0. These interrupts can be used to restore the chip from software standby mode.

**NMI Interrupt:** Nonmaskable interrupt request (NMI) is the highest-priority interrupt, and is always accepted by the CPU regardless of the interrupt control mode or the status of the CPU interrupt mask bits. The NMIEG bit in INTCR can be used to select whether an interrupt is requested at a rising edge or a falling edge on the NMI pin.

**IRQn Interrupts (n = 0 to 15 for H8S/2426 Group and H8S/2426R Group, n = 0 to 7 for H8S/2424 Group):** An IRQn interrupt is requested by an input signal at the  $\overline{\text{IRQn}}$  pin. The IRQn interrupts have the following features:

- Using ISCR, it is possible to select whether an interrupt is generated by a low level, falling edge, rising edge, or both edges, at the  $\overline{\text{IRQn}}$  pin.
- Enabling or disabling of IRQn interrupt requests can be selected with IER.
- The interrupt priority level can be set with IPR.
- The status of IRQn interrupt requests is indicated in ISR. ISR flags can be cleared to 0 by software.

When IRQn interrupt requests occur at low level of the  $\overline{\text{IRQn}}$  pin, the corresponding  $\overline{\text{IRQ}}$  pin should be held low until an interrupt handling starts. Then the corresponding  $\overline{\text{IRQ}}$  pin should be set to high in the interrupt handling routine and clear the IRQnF bit in ISR to 0. Interrupts may not be executed when the corresponding  $\overline{\text{IRQ}}$  pin is set to high before the interrupt handling starts.

Detection of IRQn interrupts does not depend on whether the relevant pin has been set for input or output. However, when a pin is used as an external interrupt input pin, do not clear the corresponding DDR to 0 and use the pin as an I/O pin for another function.

A block diagram of IRQ<sub>n</sub> interrupts is shown in figure 5.2.

**Figure 5.2 Block Diagram of IRQ Interrupts**

#### 5.4.2 Internal Interrupts

The sources for internal interrupts from on-chip peripheral modules have the following features:

- For each on-chip peripheral module there are flags that indicate the interrupt request status, and enable bits that select enabling or disabling of these interrupts. They can be controlled independently. When the enable bit is set to 1, an interrupt request is issued to the interrupt controller.
- The interrupt priority level can be set by means of IPR.
- The DMAC and DTC can be activated by a TPU, SCI, or other interrupt request.
- When the DMAC or DTC is activated by an interrupt request, it is not affected by the interrupt control mode or CPU interrupt mask bit.

## 5.5 Interrupt Exception Handling Vector Table

Table 5.2 shows interrupt exception handling sources, vector addresses, and interrupt priorities.

For default priorities, the lower the vector number, the higher the priority. When interrupt control mode 2 is set, priorities among modules can be set by means of the IPR. Modules set at the same priority will conform to their default priorities. Priorities within a module are fixed.

**Table 5.2 Interrupt Sources, Vector Addresses, and Interrupt Priorities**

| Interrupt Source    | Origin of Interrupt Source | Vector Number | Vector Address* <sup>1</sup> |                  | Priority         | DTC Activation | DMAC Activation |
|---------------------|----------------------------|---------------|------------------------------|------------------|------------------|----------------|-----------------|
|                     |                            |               | Advanced Mode                | IPR              |                  |                |                 |

- Notes: 1. Lower 16 bits of the start address.  
 2. Not supported in the H8S/2424 Group.

## 5.6 Interrupt Control Modes and Interrupt Operation

The interrupt controller has two modes: interrupt control mode 0 and interrupt control mode 2. Interrupt operations differ depending on the interrupt control mode. The interrupt control mode is selected by INTCR. Table 5.3 shows the differences between interrupt control mode 0 and interrupt control mode 2.

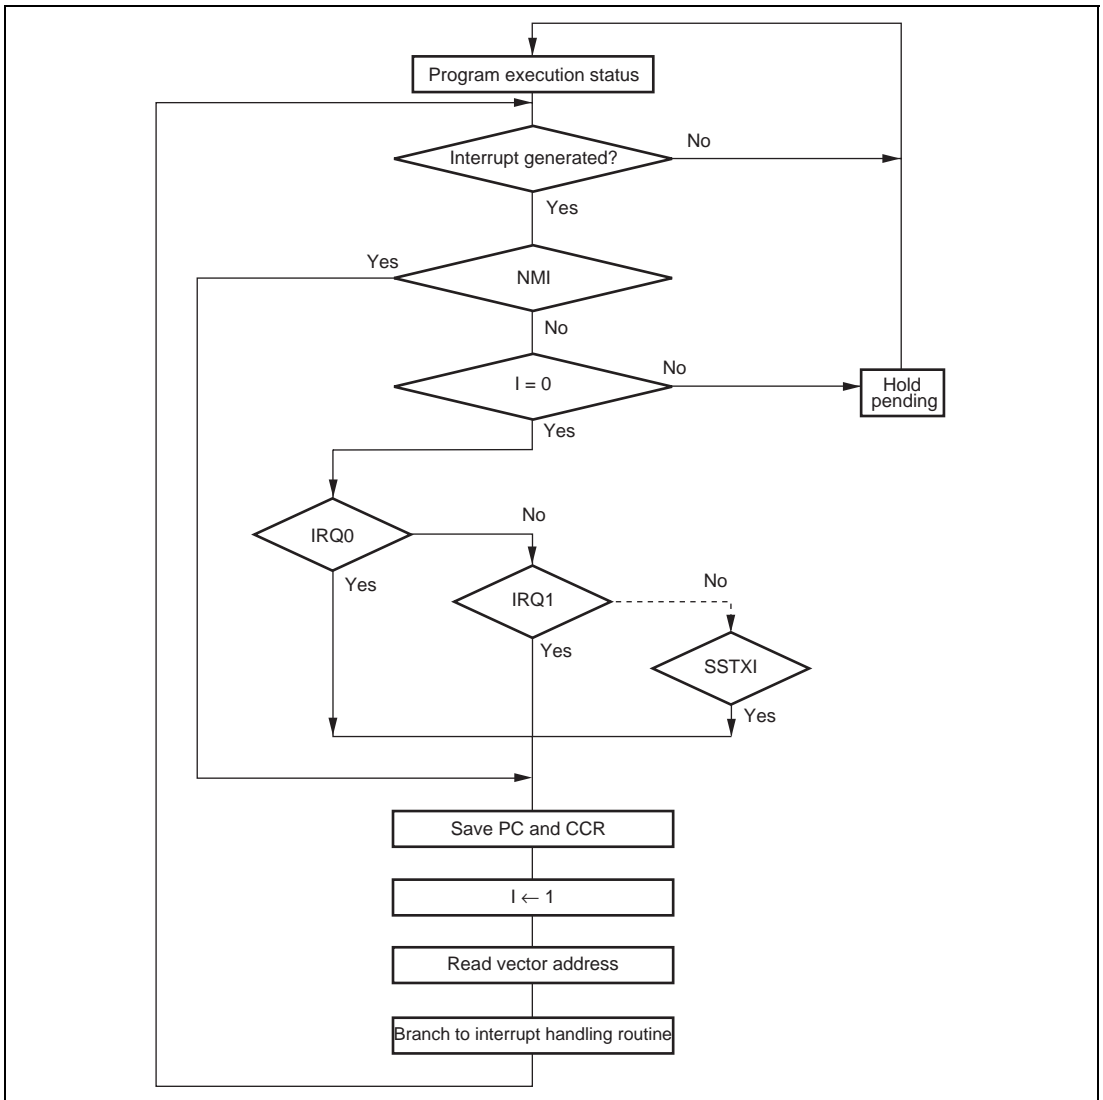

**Table 5.3 Interrupt Control Modes**

| <b>Interrupt Control Mode</b> | <b>Priority Setting Registers</b> | <b>Interrupt Mask Bits</b> | <b>Description</b>   |
|-------------------------------|-----------------------------------|----------------------------|--|
| 0                             | Default                           | I                          | The priorities of interrupt sources are fixed at the default settings.<br>Interrupt sources except for NMI is masked by the I bit. |
| 2                             | IPR                               | I2 to I0                   | 8 priority levels except for NMI can be set with IPR.<br>8-level interrupt mask control is performed by bits I2 to I0.             |

### 5.6.1 Interrupt Control Mode 0

In interrupt control mode 0, interrupt requests except for NMI are masked by the I bit of CCR in the CPU. Figure 5.3 shows a flowchart of the interrupt acceptance operation in this case.

1. If an interrupt source occurs when the corresponding interrupt enable bit is set to 1, an interrupt request is sent to the interrupt controller.
2. If the I bit is set to 1, only an NMI interrupt is accepted, and other interrupt requests are held pending. If the I bit is cleared, an interrupt request is accepted.
3. Interrupt requests are sent to the interrupt controller, the highest-ranked interrupt according to the priority system is accepted, and other interrupt requests are held pending.
4. When the CPU accepts an interrupt request, it starts interrupt exception handling after execution of the current instruction has been completed.
5. The PC and CCR are saved to the stack area by interrupt exception handling. The PC saved on the stack shows the address of the first instruction to be executed after returning from the interrupt handling routine.
6. Next, the I bit in CCR is set to 1. This masks all interrupts except NMI.
7. The CPU generates a vector address for the accepted interrupt and starts execution of the interrupt handling routine at the address indicated by the contents of the vector address in the vector table.

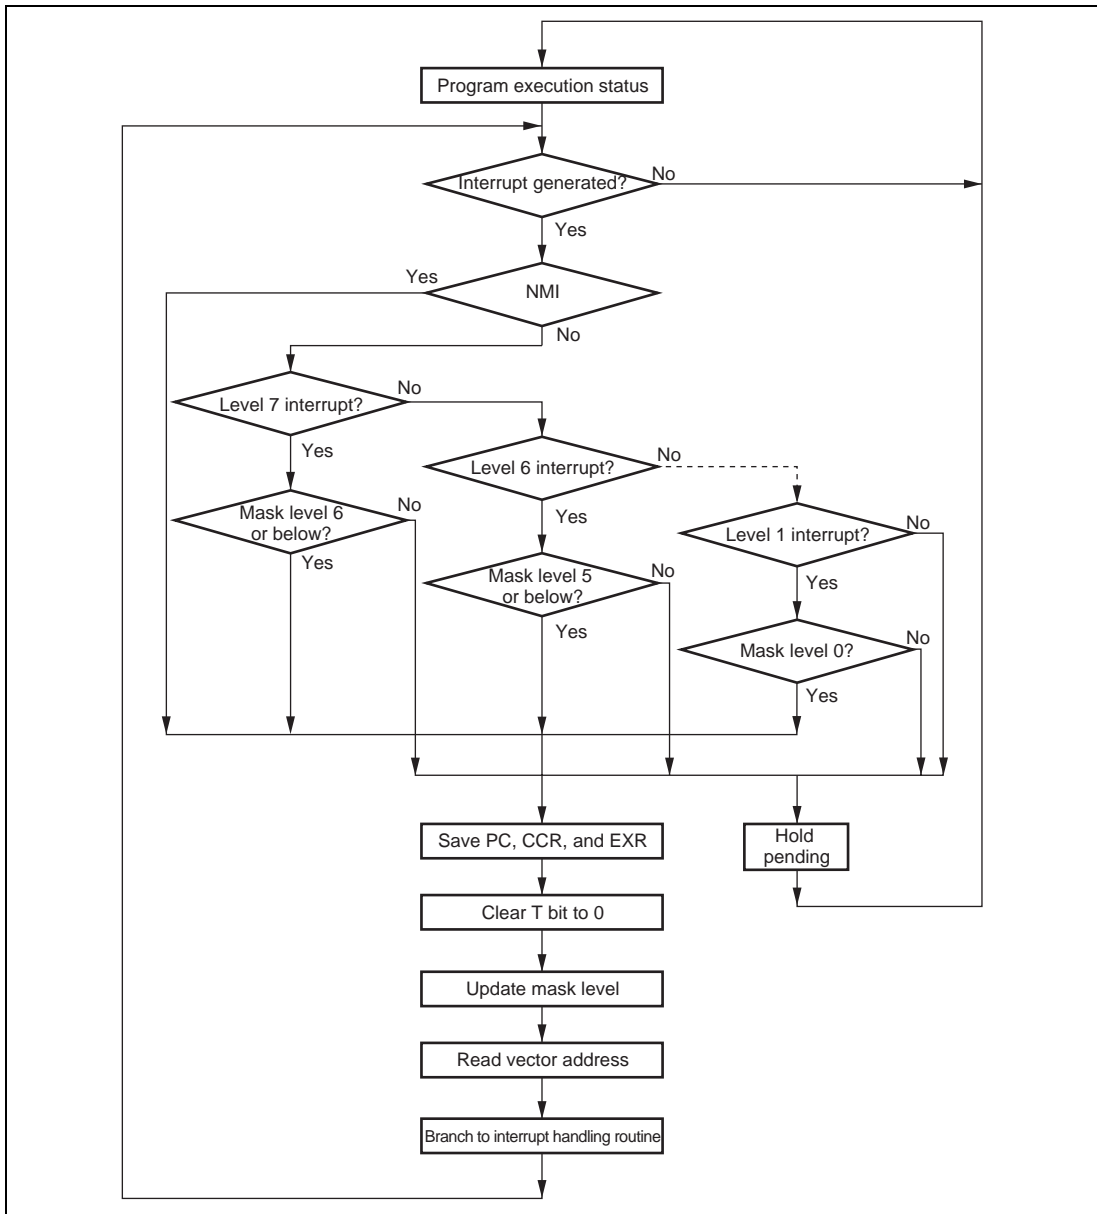

**Figure 5.3 Flowchart of Procedure Up to Interrupt Acceptance in Interrupt Control Mode 0**

## 5.6.2 Interrupt Control Mode 2

In interrupt control mode 2, mask control is done in eight levels for interrupt requests except for NMI by comparing the EXR interrupt mask level (I2 to I0 bits) in the CPU and the IPR setting. Figure 5.4 shows a flowchart of the interrupt acceptance operation in this case.

1. If an interrupt source occurs when the corresponding interrupt enable bit is set to 1, an interrupt request is sent to the interrupt controller.
2. When interrupt requests are sent to the interrupt controller, the interrupt with the highest priority according to the interrupt priority levels set in IPR is selected, and lower-priority interrupt requests are held pending. If a number of interrupt requests with the same priority are generated at the same time, the interrupt request with the highest priority according to the priority system shown in table 5.2 is selected.
3. Next, the priority of the selected interrupt request is compared with the interrupt mask level set in EXR. An interrupt request with a priority no higher than the mask level set at that time is held pending, and only an interrupt request with a priority higher than the interrupt mask level is accepted.
4. When the CPU accepts an interrupt request, it starts interrupt exception handling after execution of the current instruction has been completed.
5. The PC, CCR, and EXR are saved to the stack area by interrupt exception handling. The PC saved on the stack shows the address of the first instruction to be executed after returning from the interrupt handling routine.
6. The T bit in EXR is cleared to 0. The interrupt mask level is rewritten with the priority level of the accepted interrupt.  
If the accepted interrupt is NMI, the interrupt mask level is set to H'7.
7. The CPU generates a vector address for the accepted interrupt and starts execution of the interrupt handling routine at the address indicated by the contents of the vector address in the vector table.

**Figure 5.4 Flowchart of Procedure Up to Interrupt Acceptance in Interrupt Control Mode 2**

### 5.6.3 Interrupt Exception Handling Sequence

Figure 5.5 shows the interrupt exception handling sequence. The example shown is for the case where interrupt control mode 0 is set in advanced mode, and the program area and stack area are in on-chip memory.

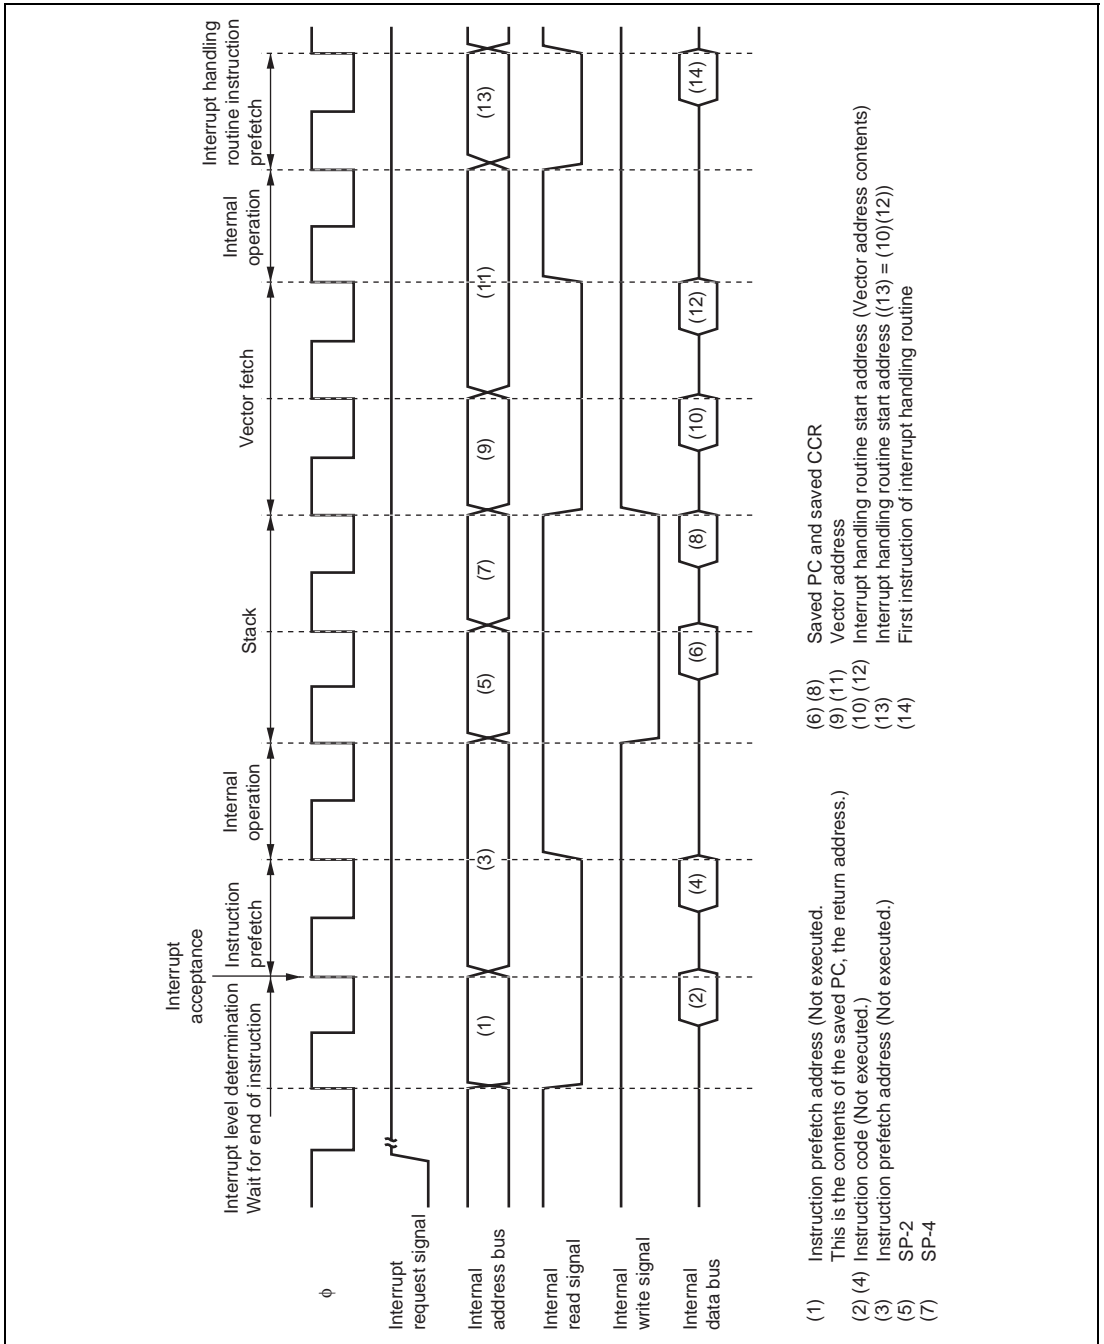

Figure 5.5 Interrupt Exception Handling

## 5.6.4 Interrupt Response Times

Table 5.4 shows interrupt response times - the interval between generation of an interrupt request and execution of the first instruction in the interrupt handling routine. The execution status symbols used in table 5.4 are explained in table 5.5. This LSI is capable of fast word transfer to on-chip memory, and have the program area in on-chip ROM and the stack area in on-chip RAM, enabling high-speed processing.

**Table 5.4 Interrupt Response Times**

| No.                          | Execution Status   | Normal Mode* <sup>5</sup>  |                            | Advanced Mode              |                            |
|------------------------------|--|----------------------------|----------------------------|----------------------------|----------------------------|
|                              |  | Interrupt control mode 0   | Interrupt control mode 2   | Interrupt control mode 0   | Interrupt control mode 2   |
| 1                            | Interrupt priority determination* <sup>1</sup>                       | 3                          | 3                          | 3                          | 3                          |
| 2                            | Number of wait states until executing instruction ends* <sup>2</sup> | 1 to 19 + 2·S <sub>i</sub> | 1 to 19 + 2·S <sub>i</sub> | 1 to 19 + 2·S <sub>i</sub> | 1 to 19 + 2·S <sub>i</sub> |
| 3                            | PC, CCR, EXR stack save  | 2·S <sub>k</sub>           | 3·S <sub>k</sub>           | 2·S <sub>k</sub>           | 3·S <sub>k</sub>           |
| 4                            | Vector fetch   | S <sub>i</sub>             | S <sub>i</sub>             | 2·S <sub>i</sub>           | 2·S <sub>i</sub>           |
| 5                            | Instruction fetch* <sup>3</sup>                                      | 2·S <sub>i</sub>           | 2·S <sub>i</sub>           | 2·S <sub>i</sub>           | 2·S <sub>i</sub>           |
| 6                            | Internal processing* <sup>4</sup>                                    | 2                          | 2                          | 2                          | 2                          |
| Total (using on-chip memory) |  | 11 to 31                   | 12 to 32                   | 12 to 32                   | 13 to 33                   |

- Notes:
1. Two states in case of internal interrupt.
  2. Refers to MULXS and DIVXS instructions.
  3. Prefetch after interrupt acceptance and interrupt handling routine prefetch.
  4. Internal processing after interrupt acceptance and internal processing after vector fetch.
  5. Not available in this LSI.

**Table 5.5 Number of States in Interrupt Handling Routine Execution Statuses**

| Symbol                    | Object of Access |                 |                |                |                |

| Branch address read $S_j$ |                  |                 |                |                |                |
| Stack manipulation $S_k$  |                  |                 |                |                |                |

[Legend]

m: Number of wait states in an external device access.

### 5.6.5 DTC and DMAC Activation by Interrupt

The DTC and DMAC can be activated by an interrupt. In this case, the following options are available:

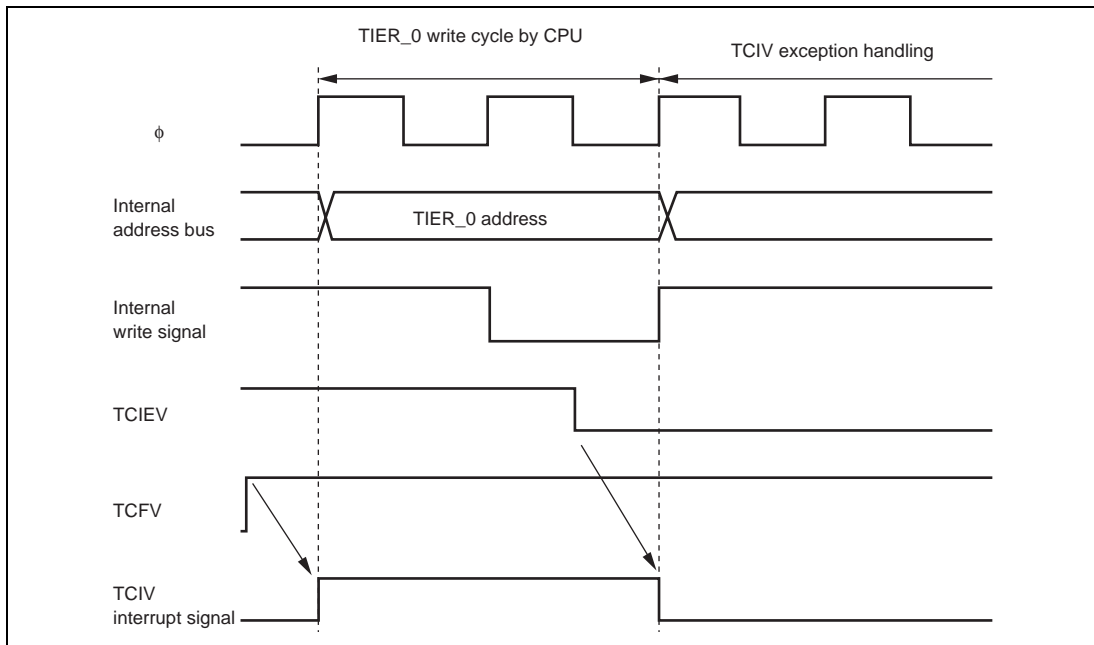

- Interrupt request to CPU
- Activation request to DTC
- Activation request to DMAC
- Selection of a number of the above

For details of interrupt requests that can be used to activate the DTC and DMAC, see table 5.2 and section 9, Data Transfer Controller (DTC) and section 7, DMA Controller (DMAC).

## 5.7 Usage Notes

### 5.7.1 Conflict between Interrupt Generation and Disabling

When an interrupt enable bit is cleared to 0 to mask interrupts, the masking becomes effective after execution of the instruction. When an interrupt enable bit is cleared to 0 by an instruction such as BCLR or MOV, if an interrupt is generated during execution of the instruction, the interrupt concerned will still be enabled on completion of the instruction, and so interrupt exception handling for that interrupt will be executed on completion of the instruction. However, if there is an interrupt request of higher priority than that interrupt, interrupt exception handling will be executed for the higher-priority interrupt, and the lower-priority interrupt will be ignored. The same also applies when an interrupt source flag is cleared to 0. Figure 5.6 shows an example in which the TCIEV bit in the TPU's TIER\_0 register is cleared to 0. The above conflict will not occur if an enable bit or interrupt source flag is cleared to 0 while the interrupt is masked.

**Figure 5.6 Conflict between Interrupt Generation and Disabling**

## 5.7.2 Instructions that Disable Interrupts

Instructions that disable interrupts are LDC, ANDC, ORC, and XORC. After any of these instructions is executed, all interrupts including NMI are disabled and the next instruction is always executed. When the I bit is set by one of these instructions, the new value becomes valid two states after execution of the instruction ends.

## 5.7.3 Times when Interrupts are Disabled

There are times when interrupt acceptance is disabled by the interrupt controller. The interrupt controller disables interrupt acceptance for a 3-state period after the CPU has updated the mask level with an LDC, ANDC, ORC, or XORC instruction.

## 5.7.4 Interrupts during Execution of EEPMOV Instruction

Interrupt operation differs between the EEPMOV.B instruction and the EEPMOV.W instruction.

With the EEPMOV.B instruction, an interrupt request (including NMI) issued during the transfer is not accepted until the transfer is completed.

With the EEPMOV.W instruction, if an interrupt request is issued during the transfer, interrupt exception handling starts at a break in the transfer cycle. The PC value saved on the stack in this case is the address of the next instruction. Therefore, if an interrupt is generated during execution of an EEPMOV.W instruction, the following coding should be used.

```
L1:  EEPMOV.W
      MOV.W   R4, R4
      BNEL1
```

## 5.7.5 Change of IRQ Pin Select Register (ITSR) Setting

When the ITSr setting is changed, an edge occurs internally and the IRQnF bit (n = 0 to 15 for H8S/2426 Group, n = 0 to 7 for H8S/2424 Group) of ISR may be set to 1 at the unintended timing if the selected pin level before the change is different from the selected pin level after the change. If the IRQn interrupt request (n = 0 to 15 for H8S/2426 Group, n = 0 to 7 for H8S/2424 Group) is enabled, the interrupt exception handling is executed. To prevent the unintended interrupt, ITSr setting should be changed while the IRQn interrupt request is disabled, then the IRQnF bit should be cleared to 0.

### 5.7.6 IRQ Status Register (ISR)

Depending on the pin status following a reset, IRQnF may be set to 1. Therefore, always read ISR and clear it to 0 after resets.

## Section 6 Bus Controller (BSC)

This LSI has an on-chip bus controller (BSC) that manages the external address space divided into eight areas.

The bus controller also has a bus arbitration function, and controls the operation of the bus mastership—the CPU, DMA controller (DMAC), EXDMA controller (EXDMAC)\*, and data transfer controller (DTC). A block diagram of the bus controller is shown in figure 6.1.

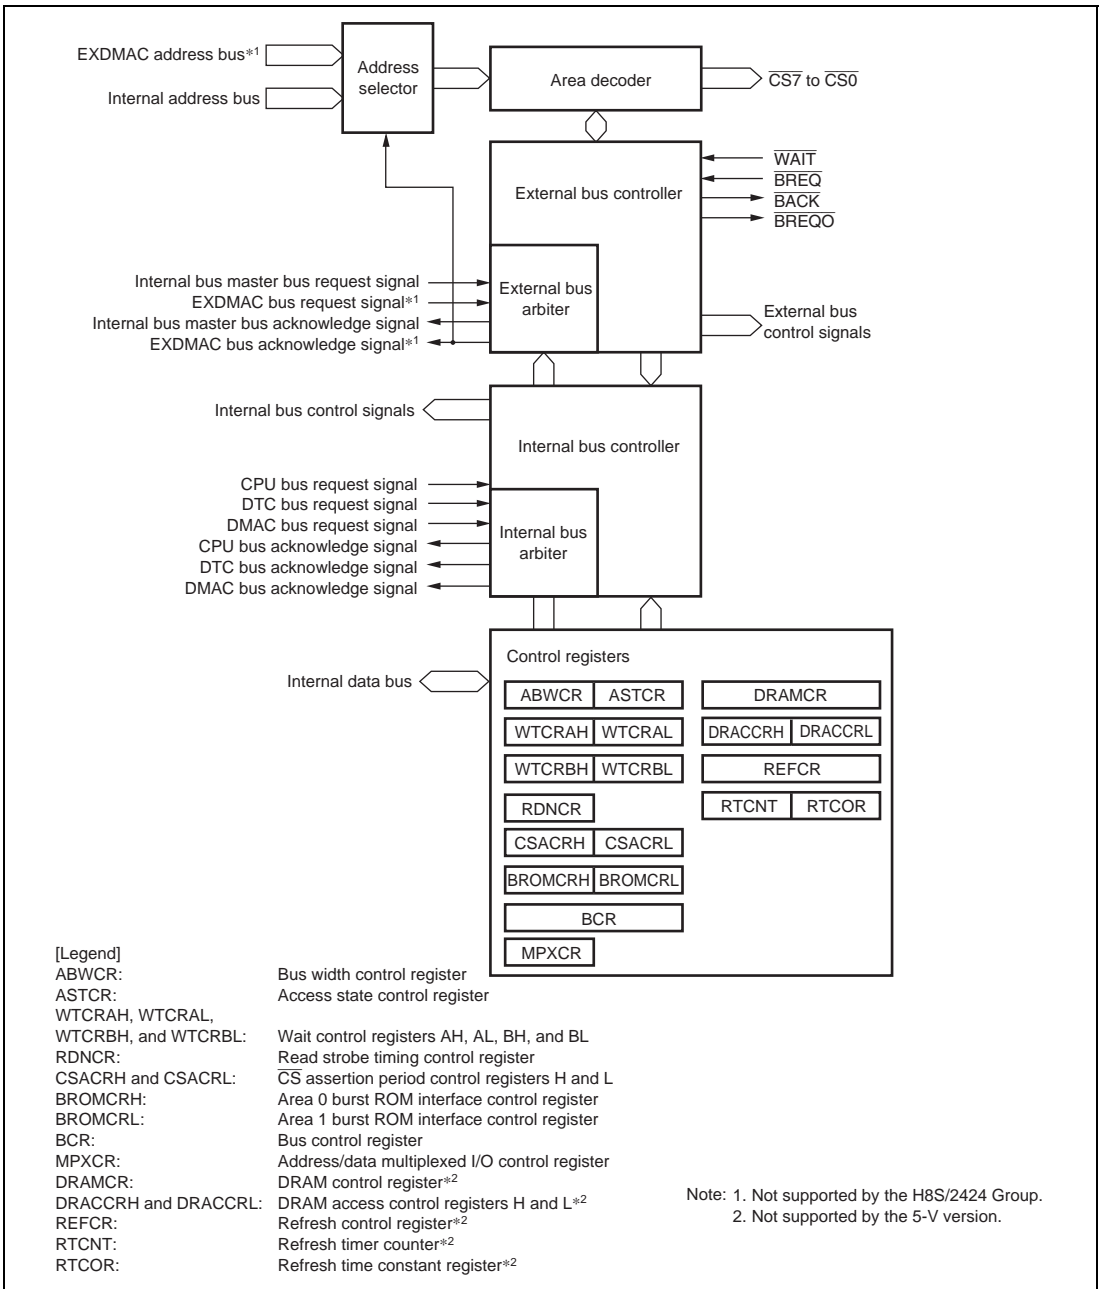

Note: \* Not supported by the H8S/2424 Group.

### 6.1 Features

- Manages external address space in area units  
 Manages the external address space divided into eight areas of 2 Mbytes  
 Bus specifications can be set independently for each area  
 Burst ROM, DRAM\*<sup>1</sup>, synchronous DRAM\*<sup>2</sup>, and address/data multiplexed I/O interfaces can be set
- Basic bus interface  
 Chip select signals ( $\overline{CS0}$  to  $\overline{CS7}$ ) can be output for areas 0 to 7  
 8-bit access or 16-bit access can be selected for each area  
 2-state access or 3-state access can be selected for each area  
 Program wait cycles can be inserted for each area  
 Extension cycles can be inserted while  $\overline{CS}$  is asserted for each area  
 Wait cycles can be inserted by the  $\overline{WAIT}$  pin  
 The negation timing of the read strobe signal ( $\overline{RD}$ ) can be modified
- Burst ROM interface  
 Burst ROM interface can be set independently for areas 0 and 1
- Address/data multiplexed I/O interface  
 Address/data multiplexed I/O interface can be set for areas 6 and 7
- DRAM interface\*<sup>1</sup>  
 DRAM interface can be set for areas 2 to 5
- Synchronous DRAM interface\*<sup>2</sup>  
 Continuous synchronous DRAM space can be set for areas 2 to 5

- Idle cycle insertion
  - Idle cycles can be inserted between external read cycles to different areas
  - Idle cycles can be inserted before the write cycle after a read cycle
  - Idle cycles can be inserted before the read cycle after a write cycle
- Write buffer function
  - External write cycles and internal accesses can be executed in parallel
  - DMAC single address transfers and internal accesses can be executed in parallel
- Bus arbitration function
  - Includes a bus arbiter that arbitrates bus mastership between the CPU, DMAC, DTC, and EXDMAC\*<sup>3</sup>

Notes: 1. Not supported by the 5-V version.  
2. Not supported by the H8S/2426 Group and H8S/2424 Group.  
3. Not supported by the H8S/2424 Group.

**Figure 6.1 Block Diagram of Bus Controller**

## 6.2 Input/Output Pins

Table 6.1 shows the pin configuration of the bus controller.

**Table 6.1 Pin Configuration**

| Name  | Symbol  | I/O    | Function   |
|---|---|--------|--|
| Address strobe  | $\overline{AS}$   | Output | Strobe signal indicating that normal space is accessed and address output on address bus is enabled.   |
| Address hold  | $\overline{AH}$   | Output | Signal indicating the timing for latching the address when the address/data multiplexed I/O space is set.  |
| Read  | $\overline{RD}$   | Output | Strobe signal indicating that normal space is being read.  |
| High write/write enable* <sup>1</sup>   | $\overline{HWR/WE}^{*1}$  | Output | Strobe signal indicating that normal space is written to, and upper half (D15 to D8) of data bus is enabled or DRAM space write enable signal.   |
| Low write   | $\overline{LWR}$  | Output | Strobe signal indicating that normal space is written to, and lower half (D7 to D0) of data bus is enabled.  |
| Chip select 0   | $\overline{CS0}$  | Output | Strobe signal indicating that area 0 is selected.  |
| Chip select 1   | $\overline{CS1}$  | Output | Strobe signal indicating that area 1 is selected   |
| Chip select 2/<br>row address strobe 2* <sup>1</sup> /<br>row address strobe* <sup>2</sup>    | $\overline{CS2}/$<br>$\overline{RAS2}^{*1}/$<br>$\overline{RAS}^{*2}$ | Output | Strobe signal indicating that area 2 is selected, DRAM row address strobe signal when area 2 is DRAM space or areas 2 to 5 are set as continuous DRAM space, or row address strobe signal of the synchronous DRAM when the synchronous DRAM interface is selected. |
| Chip select 3/<br>row address strobe 3* <sup>1</sup> /<br>column address strobe* <sup>2</sup> | $\overline{CS3}/$<br>$\overline{RAS3}^{*1}/$<br>$\overline{CAS}^{*2}$ | Output | Strobe signal indicating that area 3 is selected, DRAM row address strobe signal when area 3 is DRAM space, or column address strobe signal of the synchronous DRAM when the synchronous DRAM interface is selected.   |

| Name   | Symbol  | I/O    | Function   |
|--|---|--------|--|
| Chip select 4/<br>row address strobe 4* <sup>1</sup> /<br>write enable* <sup>2</sup>   | $\overline{\text{CS4}}$ /<br>$\overline{\text{RAS4}}^{*1}$ /<br>$\overline{\text{WE}}^{*2}$ | Output | Strobe signal indicating that area 4 is selected, DRAM row address strobe signal when area 4 is DRAM space, or write enable signal of the synchronous DRAM when the synchronous DRAM interface is selected.        |
| Chip select 5/<br>row address strobe 5* <sup>1</sup> /<br>SDRAM $\phi$ * <sup>2</sup>  | $\overline{\text{CS5}}$ /<br>$\overline{\text{RAS5}}^{*1}$ /<br>SDRAM $\phi$ * <sup>2</sup> | Output | Strobe signal indicating that area 5 is selected, DRAM row address strobe signal when area 5 is DRAM space, or dedicated clock signal for the synchronous DRAM when the synchronous DRAM interface is selected.    |
| Chip select 6  | $\overline{\text{CS6}}$   | Output | Strobe signal indicating that area 6 is selected.  |
| Chip select 7  | $\overline{\text{CS7}}$   | Output | Strobe signal indicating that area 7 is selected.  |
| Upper column address<br>strobe* <sup>1</sup> /<br>upper data mask enable* <sup>2</sup> | $\overline{\text{UCAS}}^{*1}$ /<br>$\overline{\text{DQMU}}^{*2}$                            | Output | 16-bit DRAM space upper column address strobe signal, 8-bit DRAM space column address strobe signal, upper data mask signal of 16-bit synchronous DRAM space, or data mask signal of 8-bit synchronous DRAM space. |
| Lower column address strobe/<br>lower data mask enable                                 | $\overline{\text{LCAS}}^{*1}$ /<br>$\overline{\text{DQML}}^{*2}$                            | Output | 16-bit DRAM space lower column address strobe signal or lower data mask signal for the 16-bit synchronous DRAM space.  |
| Output enable/clock enable   | $\overline{\text{OE}}^{*1}$ /<br>$\text{CKE}^{*2}$  | Output | Output enable signal for the DRAM space or clock enable signal for the synchronous DRAM space.   |
| Wait   | $\overline{\text{WAIT}}$  | Input  | Wait request signal when accessing external address space.   |
| Bus request  | $\overline{\text{BREQ}}$  | Input  | Request signal for release of bus to external bus master.  |
| Bus request acknowledge  | $\overline{\text{BACK}}$  | Output | Acknowledge signal indicating that bus has been released to external bus master.   |
| Bus request output   | $\overline{\text{BREQO}}$   | Output | External bus request signal used when internal bus master accesses external address space when external bus is released.   |

| Name   | Symbol                             | I/O                | Function  |
|--|------------------------------------|--------------------|---|
| Data transfer acknowledge 1 (DMAC)                 | $\overline{DACK1}$                 | Output             | Data transfer acknowledge signal for single address transfer by DMAC channel 1.   |
| Data transfer acknowledge 0 (DMAC)                 | $\overline{DACK0}$                 | $\overline{DACK0}$ | Data transfer acknowledge signal for single address transfer by DMAC channel 0.   |
| Data transfer acknowledge 3* <sup>2</sup> (EXDMAC) | $\overline{EDACK3}$ * <sup>3</sup> | Output             | Data transfer acknowledge signal for single address transfer by EXDMAC channel 3. |
| Data transfer acknowledge 2* <sup>2</sup> (EXDMAC) | $\overline{EDACK2}$ * <sup>3</sup> | Output             | Data transfer acknowledge signal for single address transfer by EXDMAC channel 2. |

- Notes:
1. Not supported by the 5-V version.
  2. Not supported by the H8S/2426 Group and H8S/2424 Group
  3. Not supported by the H8S/2424 Group.

## 6.3 Register Descriptions

The bus controller has the following registers.

- Bus width control register (ABWCR)
- Access state control register (ASTCR)
- Wait control register AH (WTCRAH)
- Wait control register AL (WTCRAL)
- Wait control register BH (WTCRBH)
- Wait control register BL (WTCRBL)
- Read strobe timing control register (RDNCR)
- $\overline{CS}$  assertion period control register H (CSACRH)
- $\overline{CS}$  assertion period control register L (CSACRL)
- Area 0 burst ROM interface control register (BROMCRH)
- Area 1 burst ROM interface control register (BROMCRL)
- Bus control register (BCR)
- Address/data multiplexed I/O control register (MPXCR)
- DRAM control register (DRAMCR)
- DRAM access control register (DRACCR)
- Refresh control register (REFCR)
- Refresh timer counter (RTCNT)
- Refresh time constant register (RTCOR)

### 6.3.1 Bus Width Control Register (ABWCR)

ABWCR designates each area in the external address space as either 8-bit access space or 16-bit access space.

| Bit | Bit Name | Initial Value* | R/W | Description  |
|-----|----------|----------------|-----|--|
| 7   | ABW7     | 1/0            | R/W | Area 7 to 0 Bus Width Control  |
| 6   | ABW6     | 1/0            | R/W | These bits select whether the corresponding area is to be designated as 8-bit access space or 16-bit access space. |
| 5   | ABW5     | 1/0            | R/W |  |
| 4   | ABW4     | 1/0            | R/W | 0: Area n is designated as 16-bit access space<br>1: Area n is designated as 8-bit access space<br>(n = 7 to 0)    |
| 3   | ABW3     | 1/0            | R/W |  |
| 2   | ABW2     | 1/0            | R/W |  |
| 1   | ABW1     | 1/0            | R/W |  |
| 0   | ABW0     | 1/0            | R/W |  |

Note: \* In modes 2 and 4, ABWCR is initialized to 1. In modes 1 and 7, ABWCR is initialized to 0.

### 6.3.2 Access State Control Register (ASTCR)

ASTCR designates each area in the external address space as either 2-state access space or 3-state access space.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | AST7     | 1             | R/W | Area 7 to 0 Access State Control  |
| 6   | AST6     | 1             | R/W | These bits select whether the corresponding area is to be designated as 2-state access space or 3-state access space. Wait state insertion is enabled or disabled at the same time. |
| 5   | AST5     | 1             | R/W |   |
| 4   | AST4     | 1             | R/W | 0: Area n is designated as 2-state access space<br>Wait state insertion in area n access is disabled  |
| 3   | AST3     | 1             | R/W |   |
| 2   | AST2     | 1             | R/W | 1: Area n is designated as 3-state access space<br>Wait state insertion in area n access is enabled   |
| 1   | AST1     | 1             | R/W |   |
| 0   | AST0     | 1             | R/W |   |

(n = 7 to 0)

### 6.3.3 Wait Control Registers AH, AL, BH, and BL (WTCRAH, WTCRAL, WTCRBH, and WTCRBL)

WTCRA and WTCRB select the number of program wait states for each area in the external address space.

In addition, CAS latency is set when a synchronous DRAM\* is connected.

Note: \* The synchronous DRAM interface is not supported by the H8S/2426 Group and H8S/2424 Group.

- WTCRAH

| Bit | Bit Name | Initial Value | R/W | Description  |  |
|-----|----------|---------------|-----|--|--|
| 15  | —        | 0             | R   | Reserved<br>This bit is always read as 0 and cannot be modified.   |  |

### 6.3.4 Read Strobe Timing Control Register (RDNCR)

RDNCR selects the read strobe signal ( $\overline{RD}$ ) negation timing in a basic bus interface read access.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | RDN7     | 0             | R/W | Read Strobe Timing Control 7 to 0  |
| 6   | RDN6     | 0             | R/W | These bits set the negation timing of the read strobe in a corresponding area read access.   |
| 5   | RDN5     | 0             | R/W |  |
| 4   | RDN4     | 0             | R/W | As shown in figure 6.2, the read strobe for an area for which the RDNn bit is set to 1 is negated one half-state earlier than that for an area for which the RDNn bit is cleared to 0. The read data setup and hold time specifications are also one half-state earlier. |
| 3   | RDN3     | 0             | R/W |  |
| 2   | RDN2     | 0             | R/W |  |
| 1   | RDN1     | 0             | R/W |  |
| 0   | RDN0     | 0             | R/W | 0: In an area n read access, the $\overline{RD}$ is negated at the end of the read cycle   |
|     |          |               |     | 1: In an area n read access, the $\overline{RD}$ is negated one half-state before the end of the read cycle<br>(n = 7 to 0)  |

**Figure 6.2 Read Strobe Negation Timing (Example of 3-State Access Space)**

### 6.3.5 $\overline{CS}$ Assertion Period Control Registers H, L (CSACRH, CSACRL)

CSACRH and CSACRL select whether or not the assertion period of the basic bus interface chip select signals ( $\overline{CSn}$ ) and address signals is to be extended. Extending the assertion period of the  $\overline{CSn}$  and address signals allows flexible interfacing to external I/O devices.

- CSACRH

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | CSXH7    | 0             | R/W | $\overline{CS}$ and Address Signal Assertion Period Control 1   |
| 6   | CSXH6    | 0             | R/W | These bits specify whether or not the $T_h$ cycle is to be inserted (see figure 6.3). When an area for which the CSX $n$ bit is set to 1 is accessed, a one-state $T_h$ cycle, in which only the $\overline{CSn}$ and address signals are asserted, is inserted before the normal access cycle. |
| 5   | CSXH5    | 0             | R/W |   |
| 4   | CSXH4    | 0             | R/W |   |
| 3   | CSXH3    | 0             | R/W |   |
| 2   | CSXH2    | 0             | R/W |   |
| 1   | CSXH1    | 0             | R/W |   |
| 0   | CSXH0    | 0             | R/W |   |
|     |          |               |     | 0: In area $n$ basic bus interface access, the $\overline{CSn}$ and address assertion period ( $T_h$ ) is not extended  |
|     |          |               |     | 1: In area $n$ basic bus interface access, the $\overline{CSn}$ and address assertion period ( $T_h$ ) is extended  |
|     |          |               |     | ( $n = 7$ to $0$ )  |

- CSACRL

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | CSXT7    | 0             | R/W | $\overline{CS}$ and Address Signal Assertion Period Control 2  |
| 6   | CSXT6    | 0             | R/W | These bits specify whether or not the $T_l$ cycle shown in figure 6.3 is to be inserted. When an area for which the CSXT $n$ bit is set to 1 is accessed, a one-state $T_l$ cycle, in which only the $\overline{CSn}$ and address signals are asserted, is inserted after the normal access cycle. |
| 5   | CSXT5    | 0             | R/W |  |
| 4   | CSXT4    | 0             | R/W |  |
| 3   | CSXT3    | 0             | R/W |  |
| 2   | CSXT2    | 0             | R/W |  |
| 1   | CSXT1    | 0             | R/W |  |
| 0   | CSXT0    | 0             | R/W |  |
|     |          |               |     | 0: In area $n$ basic bus interface access, the $\overline{CSn}$ and address assertion period ( $T_l$ ) is not extended   |
|     |          |               |     | 1: In area $n$ basic bus interface access, the $\overline{CSn}$ and address assertion period ( $T_l$ ) is extended   |
|     |          |               |     | ( $n = 7$ to $0$ )   |

**Figure 6.3  $\overline{CS}$  and Address Assertion Period Extension**  
 (Example of 3-State Access Space and  $RDNn = 0$ )

### 6.3.6 Area 0 Burst ROM Interface Control Register (BROMCRH) Area 1 Burst ROM Interface Control Register (BROMCRL)

BROMCRH and BROMCRL are used to make burst ROM interface settings. Area 0 and area 1 burst ROM interface settings can be made independently in BROMCRH and BROMCRL, respectively.

| Bit | Bit Name | Initial Value | R/W | Description  |  |
|-----|----------|---------------|-----|--|--|
| 7   | BSRMn    | 0             | R/W | Burst ROM Interface Select<br>Selects the basic bus interface or burst ROM interface.<br>0: Basic bus interface space<br>1: Burst ROM interface space                                      |  |
| 6   | BSTSn2   | 0             | R/W | Burst Cycle Select   |  |
| 5   | BSTSn1   | 0             | R/W | These bits select the number of burst cycle states.<br>000: 1 state<br>001: 2 states<br>010: 3 states<br>011: 4 states<br>100: 5 states<br>101: 6 states<br>110: 7 states<br>111: 8 states |  |
| 4   | BSTSn0   | 0             | R/W |  |  |
| 3   | —        | 0             | R/W |  | Reserved   |
| 2   | —        | 0             | R/W |  | These bits are always read as 0. The initial value should not be changed.  |
| 1   | BSWDn1   | 0             | R/W |  | Burst Word Number Select   |
| 0   | BSWDn0   | 0             | R/W |  | These bits select the number of words that can be burst-accessed on the burst ROM interface.<br>00: Maximum 4 words<br>01: Maximum 8 words<br>10: Maximum 16 words<br>11: Maximum 32 words |

(n = 1 or 0)

### 6.3.7 Bus Control Register (BCR)

BCR is used for idle cycle settings, selection of the external bus released state protocol, enabling or disabling of the write data buffer function, and enabling or disabling of  $\overline{\text{WAIT}}$  pin input.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 15  | BRLE     | 0             | R/W | <p>External Bus Release Enable</p> <p>Enables or disables external bus release.</p> <p>0: External bus release disabled</p> <p><math>\overline{\text{BREQ}}</math>, <math>\overline{\text{BACK}}</math>, and <math>\overline{\text{BREQO}}</math> pins can be used as I/O ports</p> <p>1: External bus release enabled</p>  |
| 14  | BREQOE   | 0             | R/W | <p><math>\overline{\text{BREQO}}</math> Pin Enable</p> <p>Controls outputting the bus request signal (<math>\overline{\text{BREQO}}</math>) to the external bus master in the external bus released state, when an internal bus master performs an external address space access, or when a refresh request* is generated.</p> <p>0: <math>\overline{\text{BREQO}}</math> output disabled</p> <p><math>\overline{\text{BREQO}}</math> pin can be used as I/O port</p> <p>1: <math>\overline{\text{BREQO}}</math> output enabled</p> |
| 13  | —        | 0             | R/W | <p>Reserved</p> <p>This bit can be read from or written to. However, the write value should always be 0.</p>  |
| 12  | IDLC     | 1             | R/W | <p>Idle Cycle State Number Select</p> <p>Specifies the number of states in the idle cycle set by ICIS2, ICIS1, and ICIS0.</p> <p>0: Idle cycle comprises 1 state</p> <p>1: Idle cycle comprises 2 states</p>  |
| 11  | ICIS1    | 1             | R/W | <p>Idle Cycle Insert 1</p> <p>When consecutive external read cycles are executed in different areas, an idle cycle can be inserted between the bus cycles.</p> <p>0: Idle cycle not inserted</p> <p>1: Idle cycle inserted</p>  |

| Bit    | Bit Name | Initial Value | R/W | Description  |
|--------|----------|---------------|-----|--|
| 10     | ICIS0    | 1             | R/W | <p>Idle Cycle Insert 0</p> <p>When an external read cycle and external write cycle are performed consecutively, an idle cycle can be inserted between the bus cycles.</p> <p>0: Idle cycle not inserted<br/>1: Idle cycle inserted</p>   |
| 9      | WDBE     | 0             | R/W | <p>Write Data Buffer Enable</p> <p>The write data buffer function can be used for an external write cycle or DMAC single address transfer cycle.</p> <p>0: Write data buffer function not used<br/>1: Write data buffer function used</p>  |
| 8      | WAITE    | 0             | R/W | <p><math>\overline{\text{WAIT}}</math> Pin Enable</p> <p>Selects enabling or disabling of wait input by the <math>\overline{\text{WAIT}}</math> pin.</p> <p>0: Wait input by <math>\overline{\text{WAIT}}</math> pin disabled<br/><math>\overline{\text{WAIT}}</math> pin can be used as I/O port<br/>1: Wait input by <math>\overline{\text{WAIT}}</math> pin enabled</p> |
| 7 to 3 | —        | All 0         | R/W | <p>Reserved</p> <p>These bits can be read from or written to. However, the write value should always be 0.</p>   |
| 2      | ICIS2    | 0             | R/W | <p>Idle Cycle Insert 2</p> <p>When an external write cycle and external read cycle are performed consecutively, an idle cycle can be inserted between the bus cycles.</p> <p>0: Idle cycle not inserted<br/>1: Idle cycle inserted</p>   |
| 1, 0   | —        | All 0         | R/W | <p>Reserved</p> <p>These bits can be read from or written to. However, the write value should always be 0.</p>   |

Note: \* The refresh control is not supported by the 5-V version.

### 6.3.8 Address/Data Multiplexed I/O Control Register (MPXCR)

MPXCR is used to make address/data multiplexed I/O interface settings.

| Bit    | Bit Name | Initial Value | R/W | Description   |
|--------|----------|---------------|-----|---|
| 7      | MPXE     | 0             | R/W | Address/Data Multiplexed I/O Interface Enable<br>These bits select the bus interface for areas 6 and 7.<br>0: Basic bus interface<br>1: Address/data multiplexed I/O interface                                      |
| 6 to 1 | —        | All 0         | R/W | Reserved<br>These bits can be read from or written to.<br>However, the write value should always be 0.  |
| 0      | ADDEX    | 0             | R/W | Address Output Cycle Extension<br>Specifies whether a wait cycle is inserted for the address output cycle of the address/data multiplexed I/O interface.<br>0: No wait cycle inserted<br>1: One wait cycle inserted |

### 6.3.9 DRAM Control Register (DRAMCR)

DRAMCR is used to make DRAM/synchronous DRAM interface settings.

Note: The synchronous DRAM interface is not supported by the H8S/2426 Group and H8S/2424 Group. The DRAM interface is not supported by the 5-V version.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 15  | OEE      | 0             | R/W | <p><math>\overline{OE}</math> Output Enable</p> <p>The <math>\overline{OE}</math> signal used when EDO page mode DRAM is connected can be output. The <math>\overline{OE}</math> signal is common to all areas designated as DRAM space.</p> <p>When the synchronous DRAM is connected, the CKE signal can be output. The CKE signal is common to the continuous synchronous DRAM space.</p> <p>0: <math>\overline{OE}</math>/CKE signal output disabled<br/> <math>\overline{OE}</math>/CKE pin can be used as I/O port.</p> <p>1: <math>\overline{OE}</math>/CKE signal output enabled</p>  |

### 6.3.10 DRAM Access Control Register (DRACCR)

DRACCR is used to set the DRAM/synchronous DRAM interface bus specifications.

Note: The synchronous DRAM interface is not supported by the H8S/2426 Group and H8S/2424 Group. The DRAM interface is not supported by the 5-V version.

| 0   | TPCS0    | 0             | R/W | <p>The number of states in the precharge cycle immediately after self-refreshing are added to the number of states set by bits TPC1 and TPC0 in DRACCR.</p> <p>000: [TPC set value] states<br/>           001: [TPC set value + 1] states<br/>           010: [TPC set value + 2] states<br/>           011: [TPC set value + 3] states<br/>           100: [TPC set value + 4] states<br/>           101: [TPC set value + 5] states<br/>           110: [TPC set value + 6] states<br/>           111: [TPC set value + 7] states</p> |

### 6.3.12 Refresh Timer Counter (RTCNT)

RTCNT is an 8-bit readable/writable up-counter. RTCNT counts up using the internal clock selected by bits RTCK2 to RTCK0 in REFCR.

When RTCNT matches RTCOR (compare match), the CMF flag in REFCR is set to 1 and RTCNT is cleared to H'00. If the RFSHE bit in REFCR is set to 1 at this time, a refresh cycle is started. If the RFSHE bit is cleared to 0 and the CMIE bit in REFCR is set to 1, a compare match interrupt (CMI) is generated.

RTCNT is initialized to H'00 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Note: The refresh control is not supported by the 5-V version.

### 6.3.13 Refresh Time Constant Register (RTCOR)

RTCOR is an 8-bit readable/writable register that sets the period for compare match operations with RTCNT.

The values of RTCOR and RTCNT are constantly compared, and if they match, the CMF flag in REFCR is set to 1 and RTCNT is cleared to H'00.

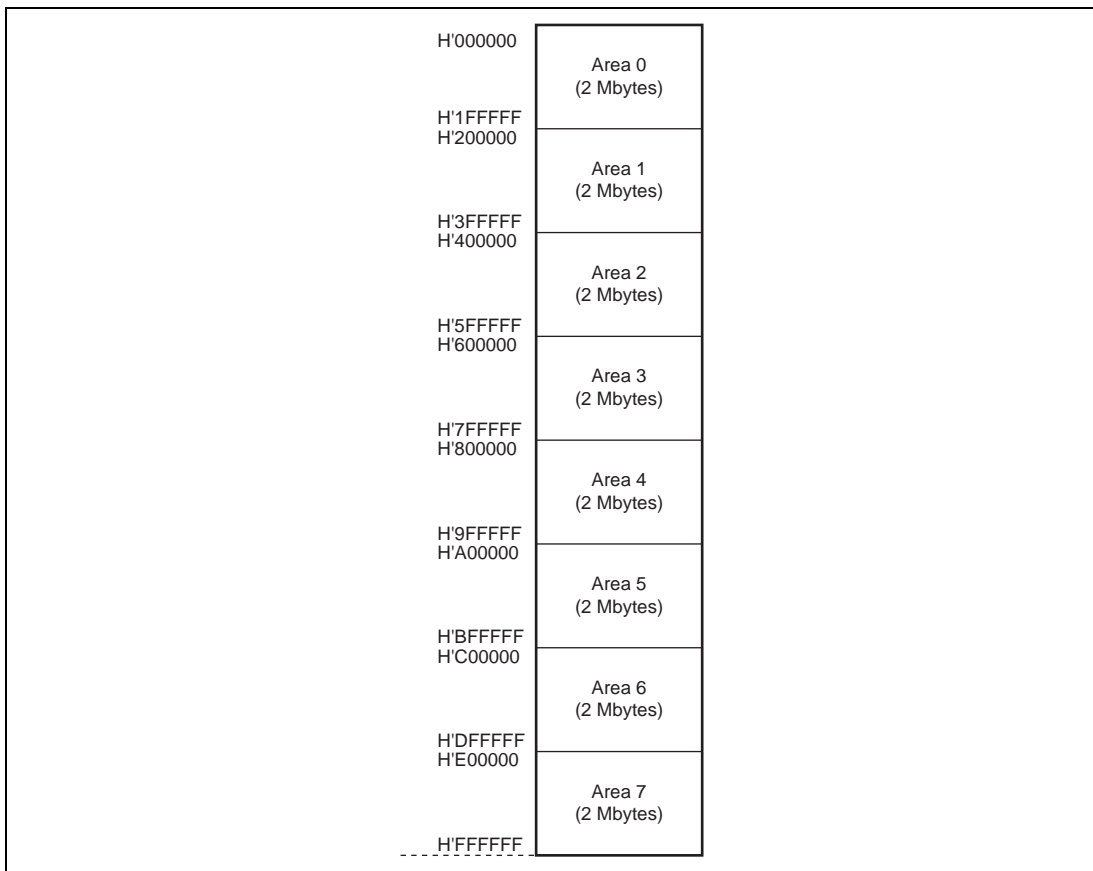

RTCOR is initialized to H'FF by a reset and in hardware standby mode. It is not initialized in software standby mode.

Note: The refresh control is not supported by the 5-V version.

## 6.4 Bus Control

### 6.4.1 Area Division

The bus controller divides the 16-Mbyte address space into eight areas, 0 to 7, in 2-Mbyte units, and performs bus control for external address space in area units. Chip select signals ( $\overline{CS0}$  to  $\overline{CS7}$ ) can be output for each area. In normal mode, a part of area 0, 64-Kbyte address space, is controlled. Figure 6.6 shows an outline of the memory map.

**Figure 6.6 Area Divisions**

## 6.4.2 Bus Specifications

The external address space bus specifications consist of five elements: bus width, number of access states, number of program wait states, read strobe timing, and chip select ( $\overline{\text{CS}}$ ) assertion period extension states. The bus width and number of access states for on-chip memory and internal I/O registers are fixed, and are not affected by the bus controller.

### (1) Bus Width

A bus width of 8 or 16 bits can be selected with ABWCR. An area for which an 8-bit bus is selected functions as an 8-bit access space, and an area for which a 16-bit bus is selected functions as a 16-bit access space. If all areas are designated as 8-bit access space, 8-bit bus mode is set; if any area is designated as 16-bit access space, 16-bit bus mode is set.

### (2) Number of Access States

Two or three access states can be selected with ASTCR. An area for which 2-state access is selected functions as a 2-state access space, and an area for which 3-state access is selected functions as a 3-state access space. With the DRAM or synchronous DRAM interface and burst ROM interface, the number of access states may be determined without regard to the setting of ASTCR.

When 2-state access space is designated, wait insertion is disabled. When 3-state access space is designated, it is possible to insert program waits by means of the WTCRA and WTCRB, and external waits by means of the  $\overline{\text{WAIT}}$  pin.

Note: The synchronous DRAM interface is not supported by the H8S/2426 Group and H8S/2424 Group. The DRAM interface is not supported by the 5-V version.

### (3) Number of Program Wait States

When 3-state access space is designated by ASTCR, the number of program wait states to be inserted automatically is selected with WTCRA and WTCRB. From 0 to 7 program wait states can be selected. Table 6.2 shows the bus specifications (bus width, and number of access states and program wait states) for each basic bus interface area.

**Table 6.2 Bus Specifications for Each Area (Basic Bus Interface)**

| ABWCR | ASTCR | WTCRA, WTCRB |      |     | Bus Specifications (Basic Bus Interface) |     |           |
|-------|-------|--------------|------|-----|--|-----|-----------|
|       |       | ABWn         | ASTn | Wn2 | Wn1                                      | Wn0 | Bus Width |

(n = 0 to 7)

**(4) Read Strobe Timing**

RDNCR can be used to select either of two negation timings (at the end of the read cycle or one half-state before the end of the read cycle) for the read strobe ( $\overline{\text{RD}}$ ) used in the basic bus interface space.

**(5) Chip Select ( $\overline{\text{CS}}$ ) Assertion Period Extension States**

Some external I/O devices require a setup time and hold time between address and  $\overline{\text{CS}}$  signals and strobe signals such as  $\overline{\text{RD}}$ ,  $\overline{\text{HWR}}$ , and  $\overline{\text{LWR}}$ . CSACR can be used to insert states in which only the  $\overline{\text{CS}}$ ,  $\overline{\text{AS}}$ , and address signals are asserted before and after a basic bus space access cycle.

### 6.4.3 Memory Interfaces

The memory interfaces in this LSI comprise a basic bus interface that allows direct connection of ROM, SRAM, and so on; an address/data multiplexed I/O interface that allows direct connection of peripheral LSIs that require address/data multiplexing, a DRAM interface that allows direct connection of DRAM; a synchronous DRAM interface that allows direct connection of synchronous DRAM; and a burst ROM interface that allows direct connection of burst ROM. The interface can be selected independently for each area.

An area for which the basic bus interface is designated functions as normal space. An area for which the address/data multiplexed I/O interface is designated functions as address/data multiplexed I/O space, an area for which the DRAM interface is designated functions as DRAM space, an area for which the synchronous DRAM interface is designated functions as continuous synchronous DRAM space, and an area for which the burst ROM interface is designated functions as burst ROM space.

The initial state of each area is basic bus interface, 3-state access space. The initial bus width is selected according to the operating mode.

Note: The synchronous DRAM interface is not supported by the H8S/2426 Group and H8S/2424 Group. The DRAM interface is not supported by the 5-V version.

#### (1) Area 0

Area 0 includes on-chip ROM in expanded mode with on-chip ROM enabled and the space excluding on-chip ROM is external address space, and in expanded mode with on-chip ROM disabled, all of area 0 is external address space.

When area 0 external space is accessed, the  $\overline{CS0}$  signal can be output.

Either the basic bus interface or burst ROM interface can be selected for the memory interface of area 0.

#### (2) Area 1

In externally expanded mode, all of area 1 is external address space.

When area 1 external address space is accessed, the  $\overline{CS1}$  signal can be output.

Either the basic bus interface or burst ROM interface can be selected for the memory interface of area 1.

### (3) Areas 2 to 5

In externally expanded mode, areas 2 to 5 are all external address space.

When area 2 to 5 external space is accessed, signals  $\overline{CS2}$  to  $\overline{CS5}$  can be output.

The basic bus interface, DRAM interface, or synchronous DRAM interface can be selected for the memory interface of areas 2 to 5. With the DRAM interface, signals  $\overline{CS2}$  to  $\overline{CS5}$  are used as  $\overline{RAS2}$  to  $\overline{RAS5}$  signals.

If areas 2 to 5 are designated as continuous DRAM space, large-capacity (e.g. 64-Mbit) DRAM can be connected. In this case, the  $\overline{CS2}$  signal is used as the  $\overline{RAS}$  signal for the continuous DRAM space.

If areas 2 to 5 are designated as continuous synchronous DRAM space, large-capacity (e.g. 64-Mbit) synchronous DRAM can be connected. In this case, the  $\overline{CS2}$ ,  $\overline{CS3}$ ,  $\overline{CS4}$ , and  $\overline{CS5}$  pins are used as the  $\overline{RAS}$ ,  $\overline{CAS}$ ,  $\overline{WE}$ , and CLK signals for the continuous synchronous DRAM space. The  $\overline{OE}$  pin is used as the CKE signal.

### (4) Area 6

In externally expanded mode, all of area 6 is external space.

When area 6 external space is accessed, the  $\overline{CS6}$  signal can be output.

Either the basic bus interface or address/data multiplexed I/O interface can be used for the memory interface of area 6.

### (5) Area 7

Area 7 includes the on-chip RAM and internal/O registers. In externally expanded mode, the space excluding the on-chip RAM and internal I/O registers is external address space. The on-chip RAM is enabled when the RAME bit is set to 1 in the system control register (SYSCR); when the RAME bit is cleared to 0, the on-chip RAM is disabled and the corresponding addresses are in external address space.

When area 7 external address space is accessed, the  $\overline{CS7}$  signal can be output.

Either the basic bus interface or address/data multiplexed I/O interface can be used for the memory interface of area 7.

#### 6.4.4 Chip Select Signals

This LSI can output chip select signals ( $\overline{CS0}$  to  $\overline{CS7}$ ) for areas 0 to 7. The signal outputs low when the corresponding external space area is accessed. Figure 6.7 shows an example of  $\overline{CS0}$  to  $\overline{CS7}$  signals output timing.

Enabling or disabling of  $\overline{CS0}$  to  $\overline{CS7}$  signals output is set by the data direction register (DDR) bit for the port corresponding to the  $\overline{CS0}$  to  $\overline{CS7}$  pins.

In expanded mode with on-chip ROM disabled, the  $\overline{CS0}$  pin is placed in the output state after a reset. Pins  $\overline{CS1}$  to  $\overline{CS7}$  are placed in the input state after a reset and so the corresponding DDR bits and PFCR0 bits should be set to 1 when outputting signals  $\overline{CS1}$  to  $\overline{CS7}$ .

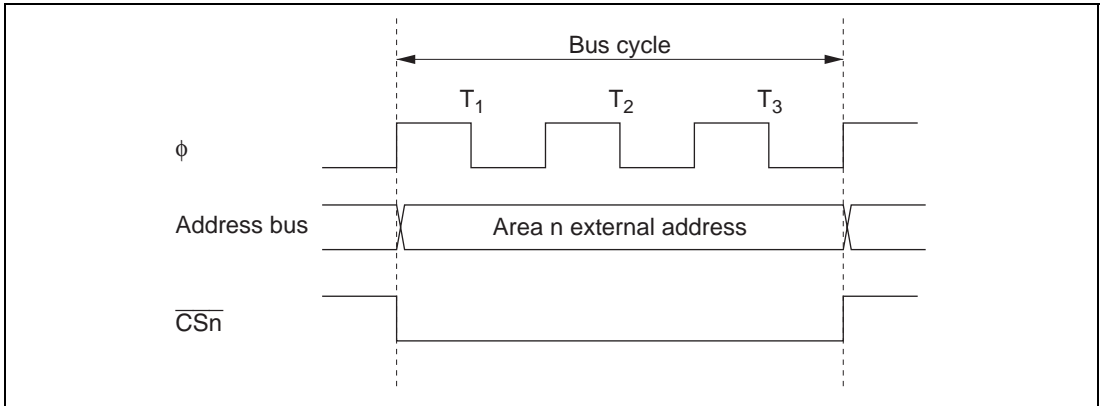

In expanded mode with on-chip ROM enabled, pins  $\overline{CS0}$  to  $\overline{CS7}$  are all placed in the input state after a reset and so the corresponding DDR bits and PFCR0 bits should be set to 1 when outputting signals  $\overline{CS0}$  to  $\overline{CS7}$ .

When areas 2 to 5 are designated as DRAM\*<sup>1</sup> space, outputs  $\overline{CS2}$  to  $\overline{CS5}$  are used as  $\overline{RAS2}$  to  $\overline{RAS5}$  signals, and when designated as continuous DRAM space, the  $\overline{CS2}$  output is used as the  $\overline{RAS}$  signal.

When areas 2 to 5 are designated as continuous synchronous DRAM\*<sup>2</sup> space in the H8S/2426R Group, outputs  $\overline{CS2}$ ,  $\overline{CS3}$ ,  $\overline{CS4}$ , and  $\overline{CS5}$  are used as  $\overline{RAS}$ ,  $\overline{CAS}$ ,  $\overline{WE}$ , and CLK signals.

Notes: The A23E bit in PFCR1 should be cleared to 0 when  $\overline{CS7}$  signal is output in the H8S/2424 Group.

1. The DRAM interface is not supported by the 5-V version.
2. The synchronous DRAM interface is not supported by the H8S/2426 Group and H8S/2424 Group.

**Figure 6.7**  $\overline{CSn}$  Signal Output Timing (n = 0 to 7)

## 6.5 Basic Bus Interface

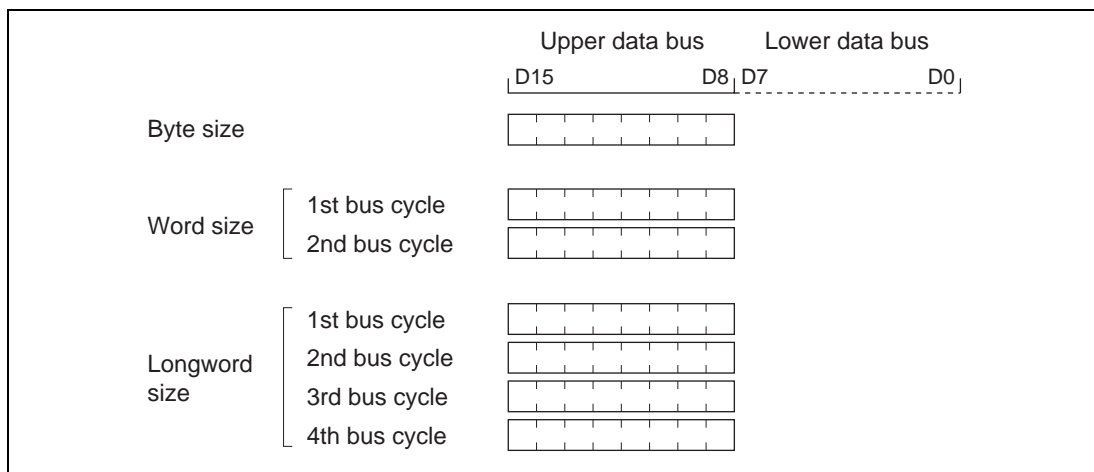

The basic bus interface enables direct connection of ROM, SRAM, and so on.

### 6.5.1 Data Size and Data Alignment

Data sizes for the CPU and other internal bus masters are byte, word, and longword. The bus controller has a data alignment function, and when accessing external address space, controls whether the upper data bus (D15 to D8) or lower data bus (D7 to D0) is used according to the bus specifications for the area being accessed (8-bit access space or 16-bit access space) and the data size.

#### (1) 8-Bit Access Space

Figure 6.8 illustrates data alignment control for the 8-bit access space. With the 8-bit access space, the upper data bus (D15 to D8) is always used for accesses. The amount of data that can be accessed at one time is one byte: a word access is performed as two byte accesses, and a longword access, as four byte accesses.

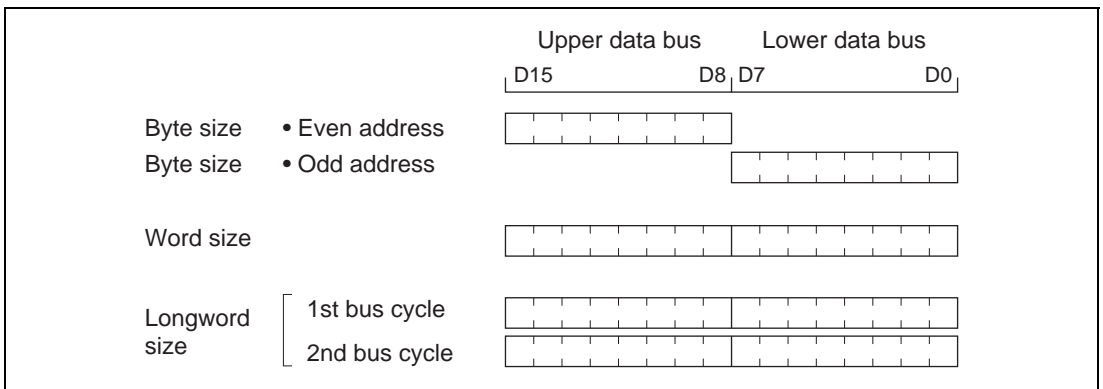

**Figure 6.8 Access Sizes and Data Alignment Control (8-Bit Access Space)**

## (2) 16-Bit Access Space

Figure 6.9 illustrates data alignment control for the 16-bit access space. With the 16-bit access space, the upper data bus (D15 to D8) and lower data bus (D7 to D0) are used for accesses. The amount of data that can be accessed at one time is one byte or one word, and a longword access is executed as two word accesses.

In byte access, whether the upper or lower data bus is used is determined by whether the address is even or odd. The upper data bus is used for an even address, and the lower data bus for an odd address.

**Figure 6.9 Access Sizes and Data Alignment Control (16-Bit Access Space)**

## 6.5.2 Valid Strobes

Table 6.3 shows the data buses used and valid strobes for the access spaces.

In a read, the  $\overline{RD}$  signal is valid for both the upper and the lower half of the data bus. In a write, the  $\overline{HWR}$  signal is valid for the upper half of the data bus, and the  $\overline{LWR}$  signal for the lower half.

**Table 6.3 Data Buses Used and Valid Strobes**

| Area                | Access Size | Read/Write | Address                          | Valid Strobe     | Upper Data Bus (D15 to D8) | Lower Data Bus (D7 to D0) |
|---------------------|-------------|------------|----------------------------------|------------------|----------------------------|---------------------------|
| 8-bit access space  | Byte        | Read       | —                                | $\overline{RD}$  | Valid                      | Invalid                   |
|                     |             | Write      | —                                | $\overline{HWR}$ |                            | Hi-Z                      |
| 16-bit access space | Byte        | Read       | Even                             | $\overline{RD}$  | Valid                      | Invalid                   |
|                     |             |            | Odd                              |                  | Invalid                    | Valid                     |
|                     |             | Write      | Even                             | $\overline{HWR}$ | Valid                      | Hi-Z                      |
|                     |             |            | Odd                              | $\overline{LWR}$ | Hi-Z                       | Valid                     |
| Word                | Read        | —          | $\overline{RD}$                  | Valid            | Valid                      |                           |
|                     | Write       | —          | $\overline{HWR}, \overline{LWR}$ | Valid            | Valid                      |                           |

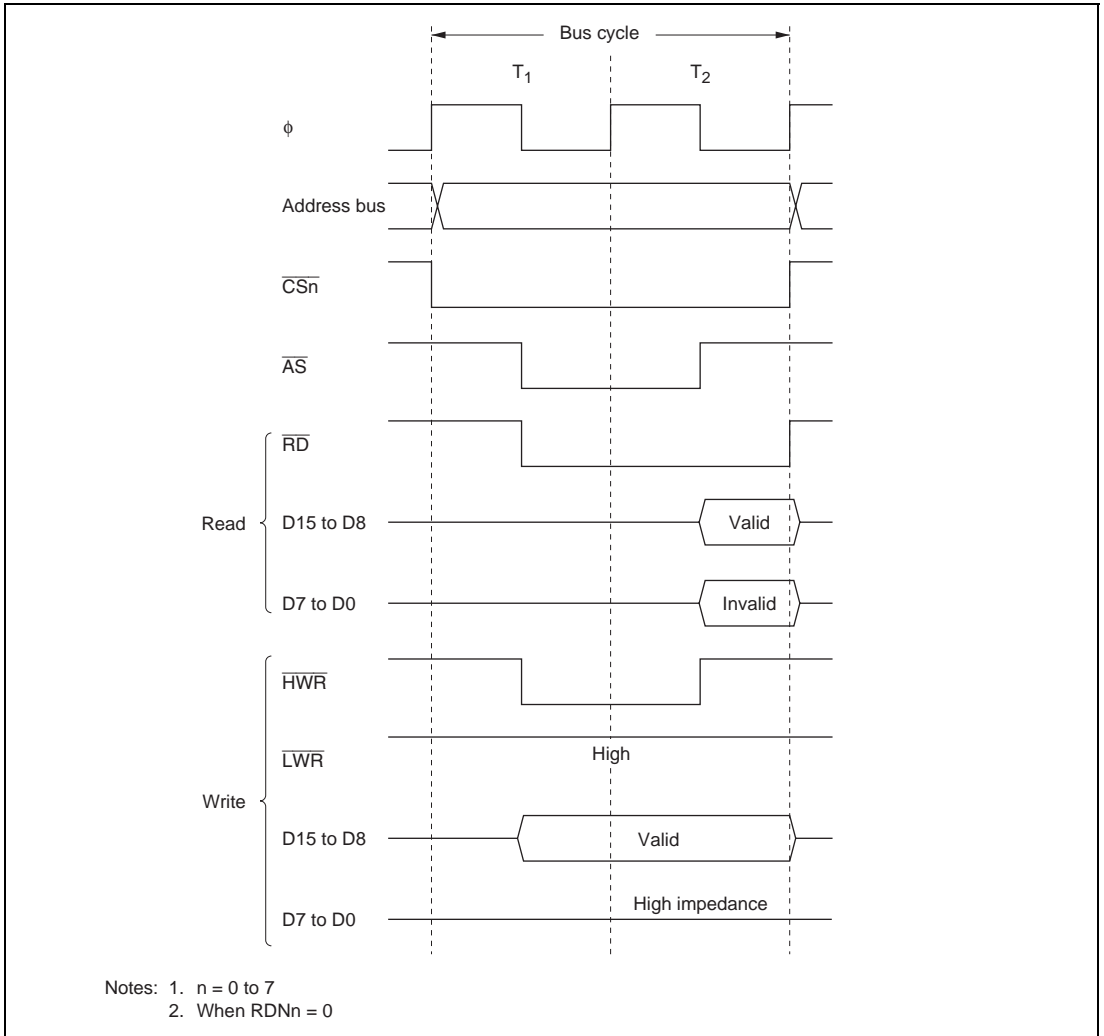

Note: Hi-Z: High-impedance state

Invalid: Input state; input value is ignored.

### 6.5.3 Basic Timing

#### (1) 8-Bit, 2-State Access Space

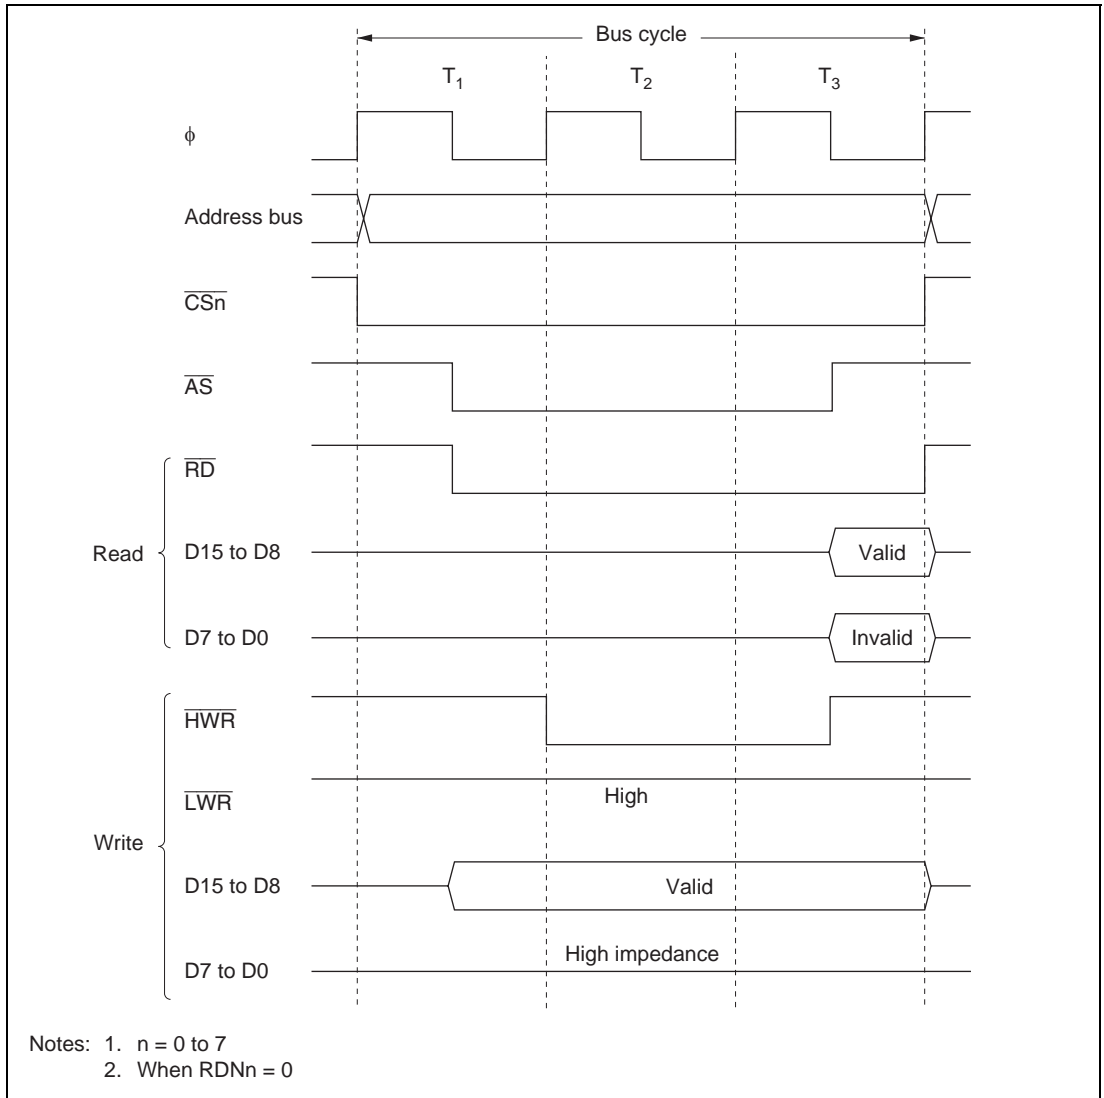

Figure 6.10 shows the bus timing for an 8-bit, 2-state access space. When an 8-bit access space is accessed, the upper half (D15 to D8) of the data bus is used. The  $\overline{\text{LWR}}$  pin is always fixed high. Wait states can be inserted.

**Figure 6.10 Bus Timing for 8-Bit, 2-State Access Space**

## (2) 8-Bit, 3-State Access Space

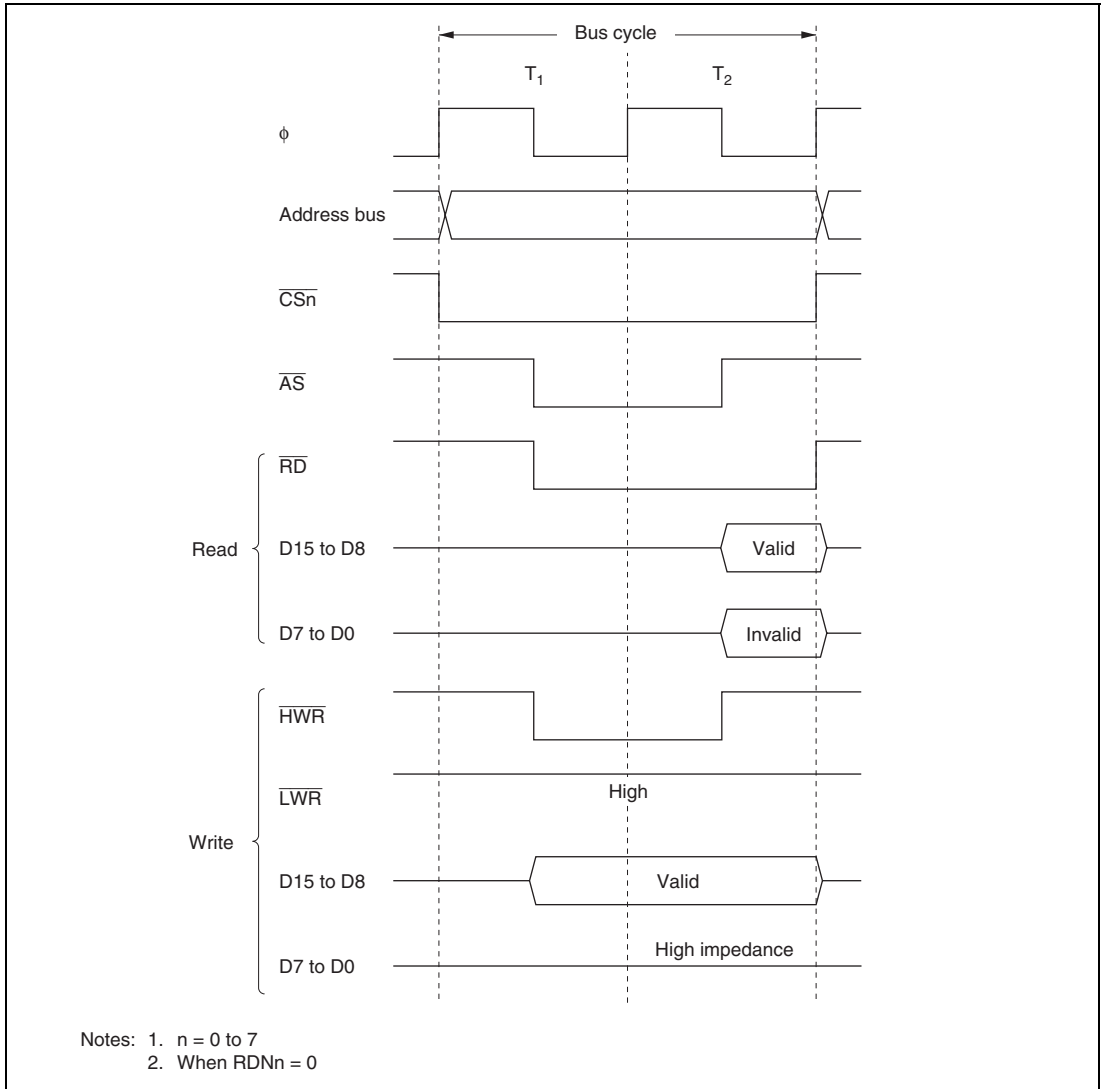

Figure 6.11 shows the bus timing for an 8-bit, 3-state access space. When an 8-bit access space is accessed, the upper half (D15 to D8) of the data bus is used. The  $\overline{LWR}$  pin is always fixed high. Wait states can be inserted.

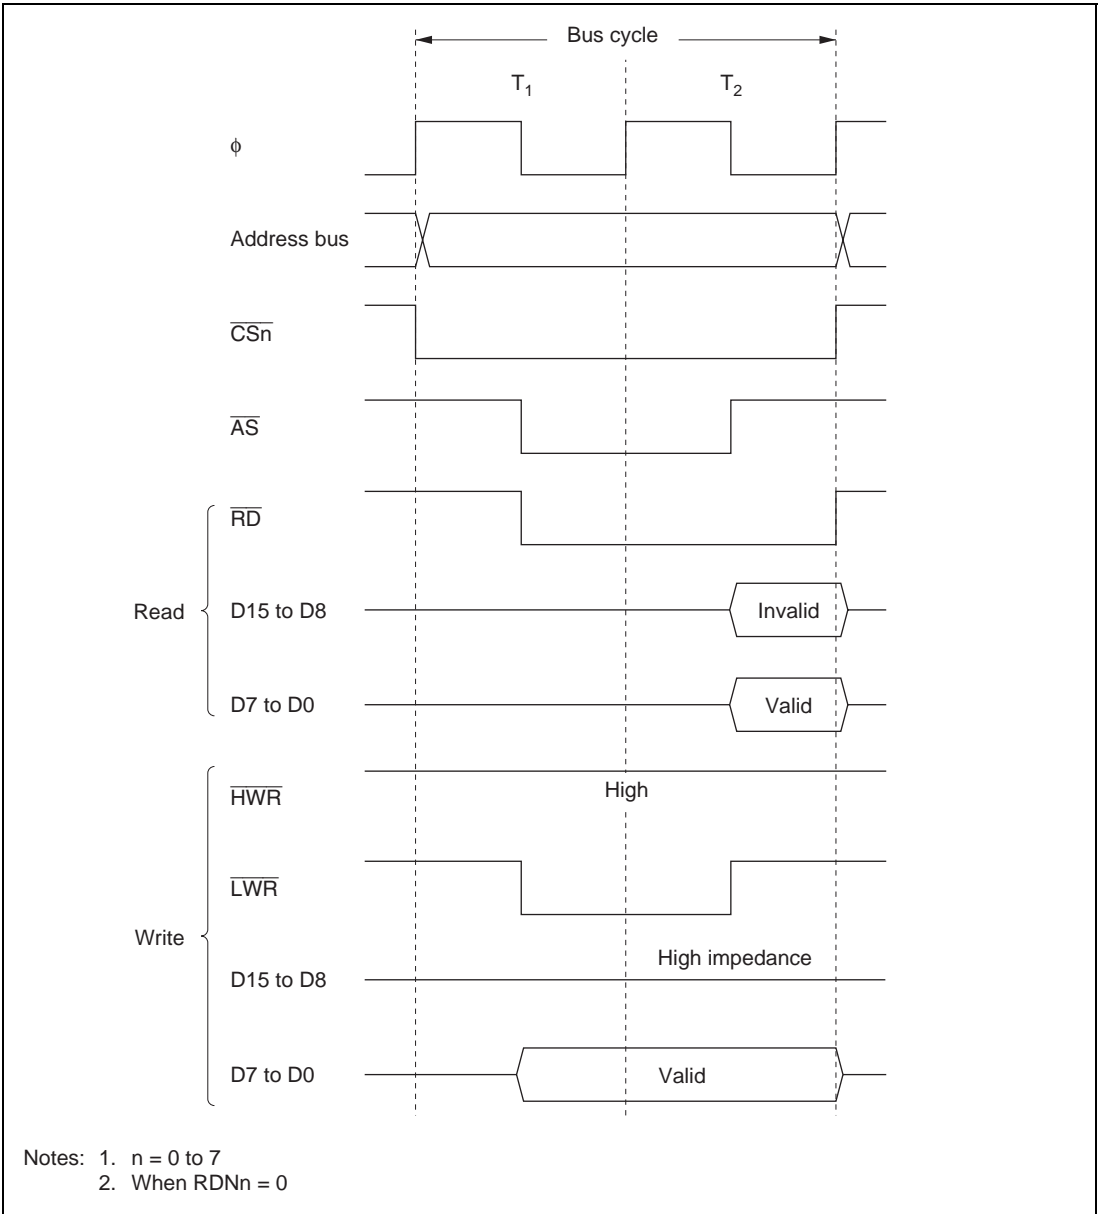

**Figure 6.11 Bus Timing for 8-Bit, 3-State Access Space**

### (3) 16-Bit, 2-State Access Space

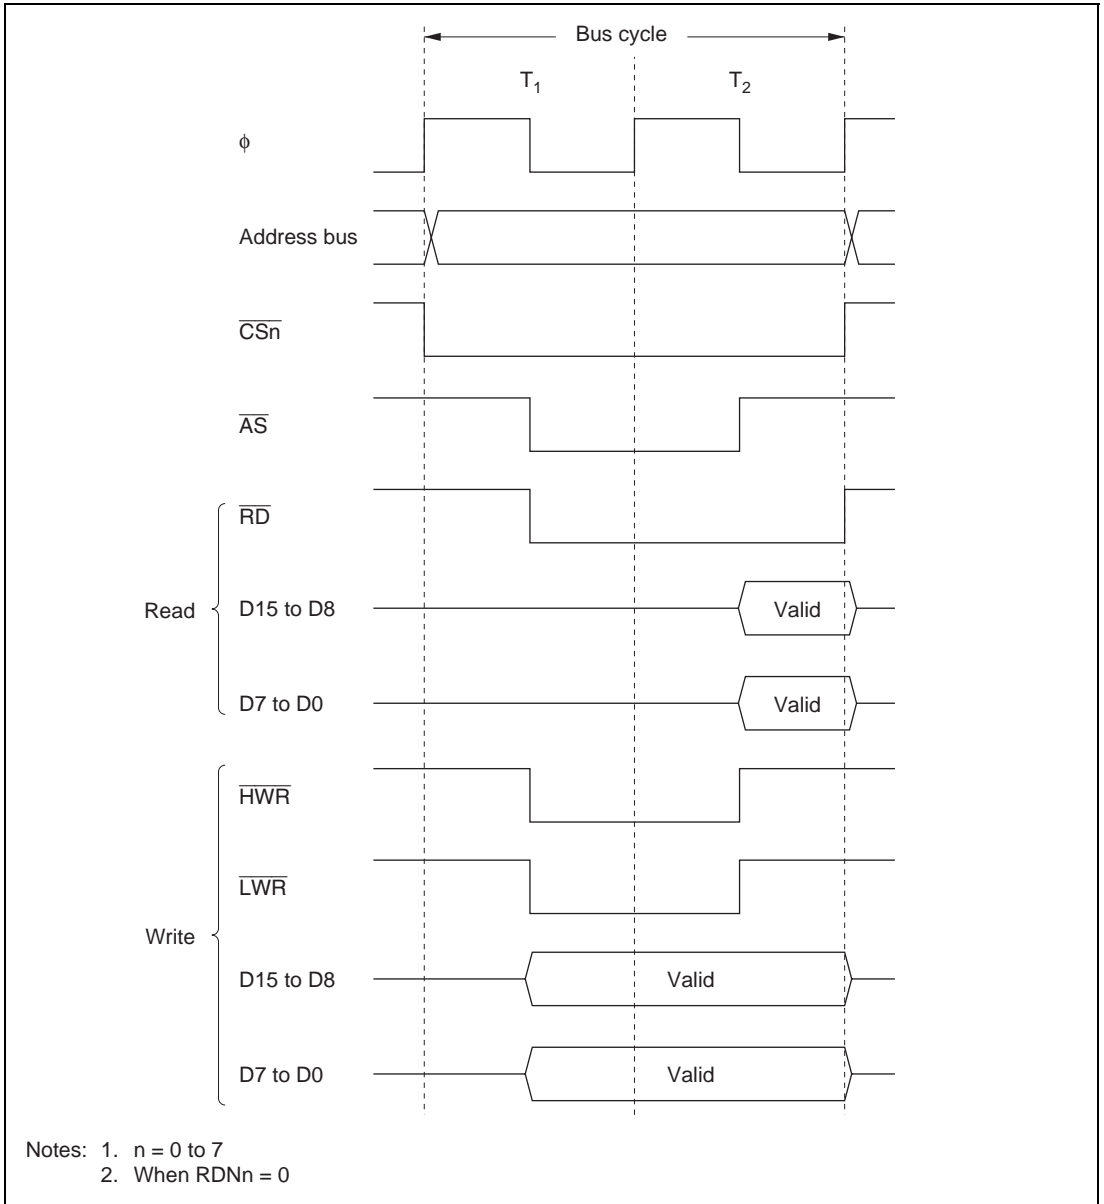

Figures 6.12 to 6.14 show bus timings for a 16-bit, 2-state access space. When a 16-bit access space is accessed, the upper half (D15 to D8) of the data bus is used for even addresses, and the lower half (D7 to D0) for odd addresses. Wait states cannot be inserted.

**Figure 6.12 Bus Timing for 16-Bit, 2-State Access Space (Even Address Byte Access)**

**Figure 6.13 Bus Timing for 16-Bit, 2-State Access Space (Odd Address Byte Access)**

**Figure 6.14 Bus Timing for 16-Bit, 2-State Access Space (Word Access)**

#### (4) 16-Bit, 3-State Access Space

Figures 6.15 to 6.17 show bus timings for a 16-bit, 3-state access space. When a 16-bit access space is accessed, the upper half (D15 to D8) of the data bus is used for even addresses, and the lower half (D7 to D0) for odd addresses. Wait states can be inserted.

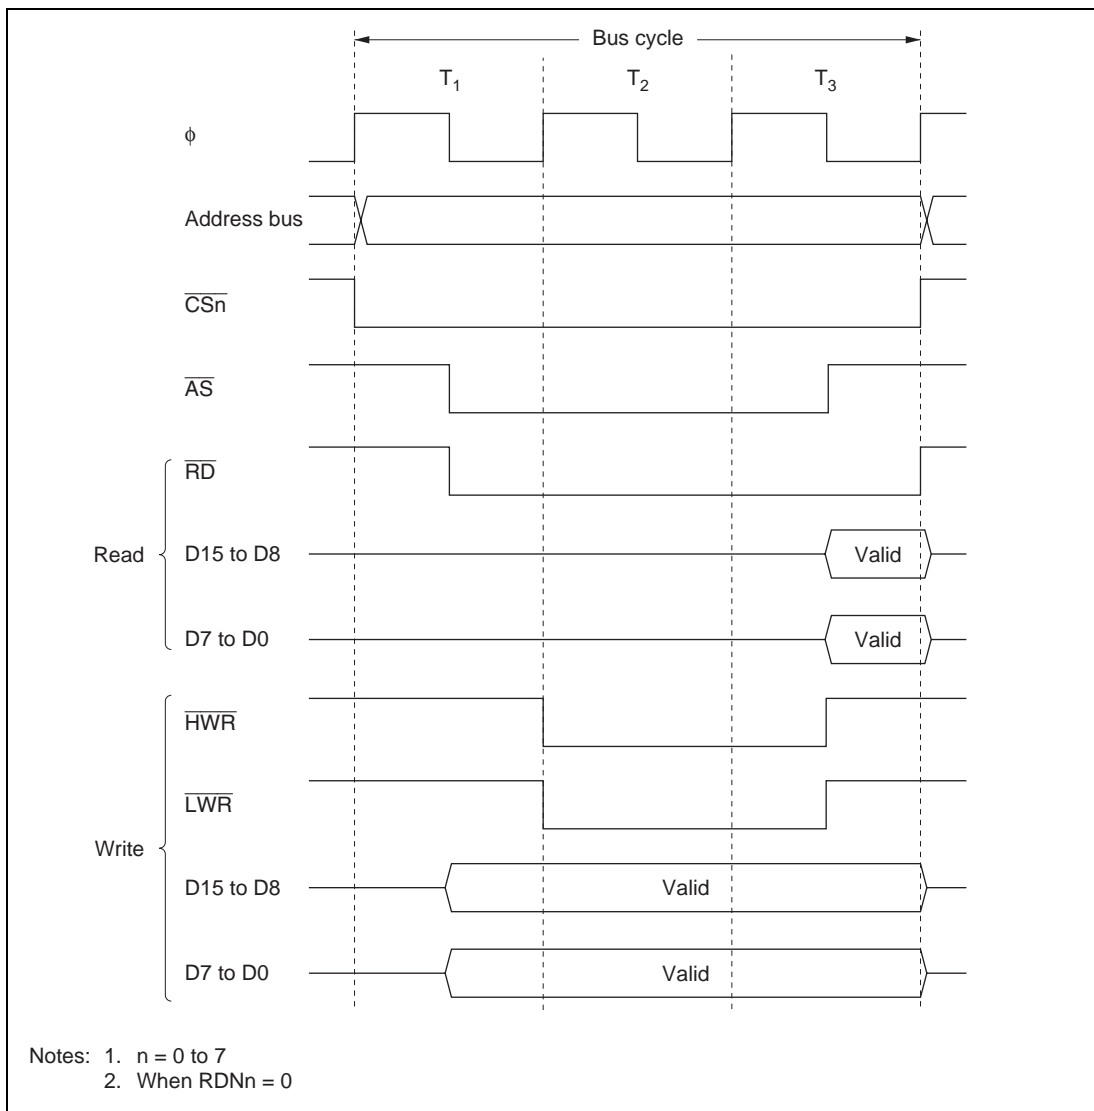

**Figure 6.15 Bus Timing for 16-Bit, 3-State Access Space  
(Even Address Byte Access)**

**Figure 6.16 Bus Timing for 16-Bit, 3-State Access Space (Odd Address Byte Access)**

**Figure 6.17 Bus Timing for 16-Bit, 3-State Access Space (Word Access)**

### 6.5.4 Wait Control

When accessing external space, this LSI can extend the bus cycle by inserting one or more wait states ( $T_w$ ). There are two ways of inserting wait states: program wait insertion and pin wait insertion using the  $\overline{\text{WAIT}}$  pin.

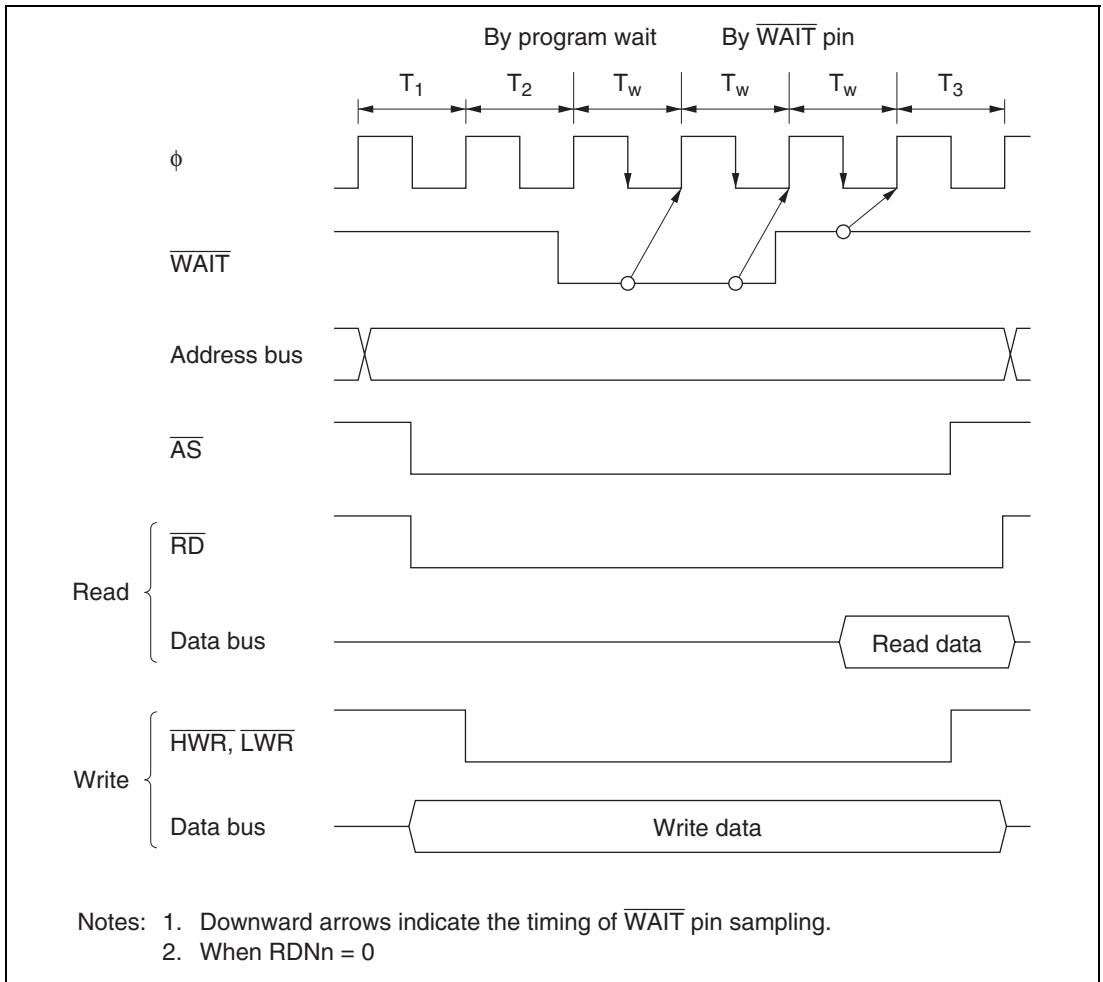

#### (1) Program Wait Insertion

From 0 to 7 wait states can be inserted automatically between the  $T_2$  state and  $T_3$  state on an individual area basis in 3-state access space, according to the settings in WTCRA and WTCRB.

#### (2) Pin Wait Insertion

Setting the WAITE bit to 1 in BCR enables wait input by means of the  $\overline{\text{WAIT}}$  pin. When external space is accessed in this state, a program wait is first inserted in accordance with the settings in WTCRA and WTCRB. If the  $\overline{\text{WAIT}}$  pin is low at the falling edge of  $\phi$  in the last  $T_2$  or  $T_w$  state, another  $T_w$  state is inserted. If the  $\overline{\text{WAIT}}$  pin is held low,  $T_w$  states are inserted until it goes high. This is useful when inserting seven or more  $T_w$  states, or when changing the number of  $T_w$  states to be inserted for different external devices. The WAITE bit setting applies to all areas. Figure 6.18 shows an example of wait state insertion timing.

The settings after a reset are: 3-state access, insertion of 7 program wait states, and  $\overline{\text{WAIT}}$  input disabled.

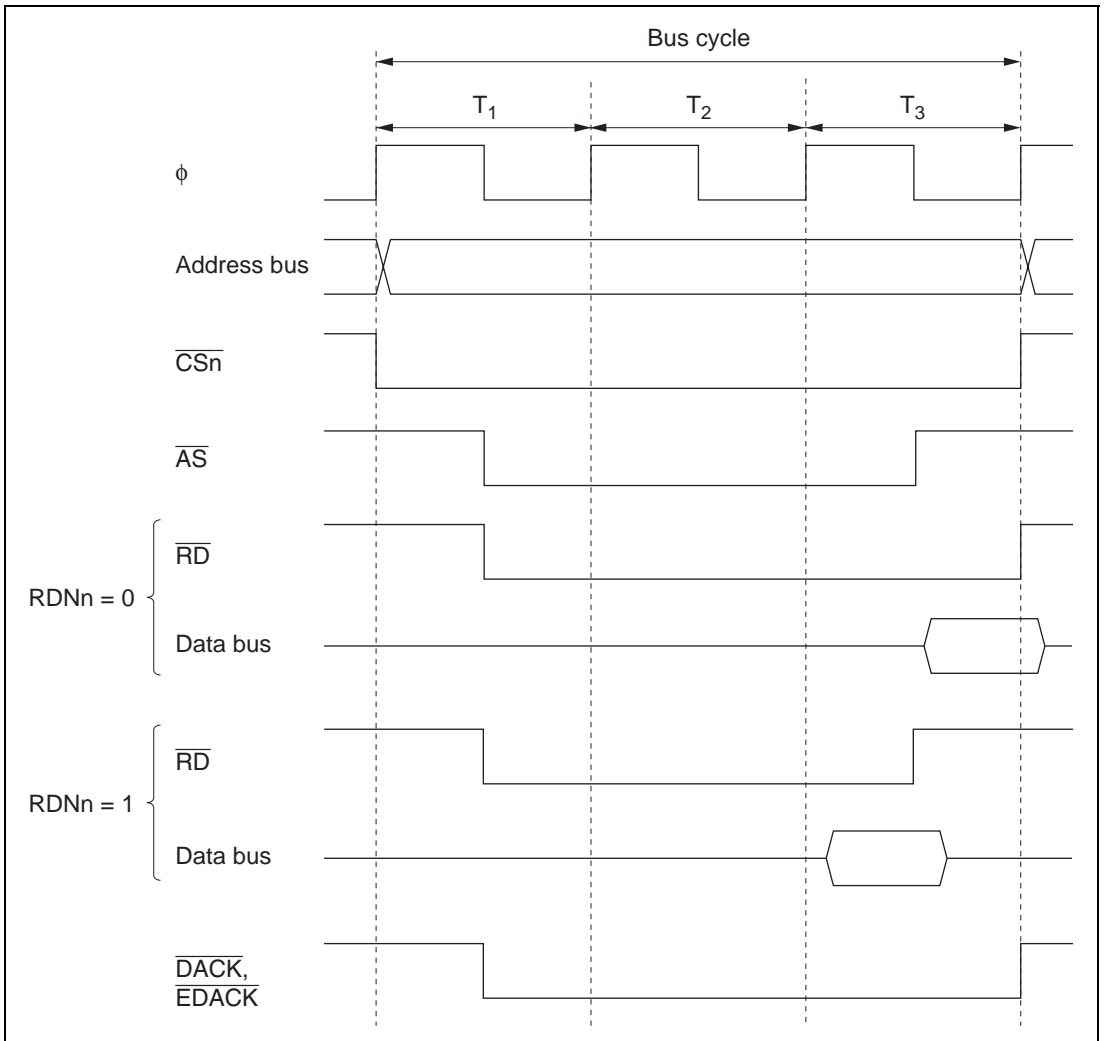

**Figure 6.18 Example of Wait State Insertion Timing**

### 6.5.5 Read Strobe ( $\overline{\text{RD}}$ ) Timing

The read strobe ( $\overline{\text{RD}}$ ) timing can be changed for individual areas by setting bits  $\text{RDn}7$  to  $\text{RDn}0$  to 1 in  $\text{RDnCR}$ . Figure 6.19 shows an example of the timing when the read strobe timing is changed in basic bus 3-state access space.

When the DMAC or EXDMAC is used in single address mode, note that if the  $\overline{\text{RD}}$  timing is changed by setting  $\text{RDn}$  to 1, the  $\overline{\text{RD}}$  timing will change relative to the rise of  $\text{DACK}$  or  $\text{EDACK}$ .

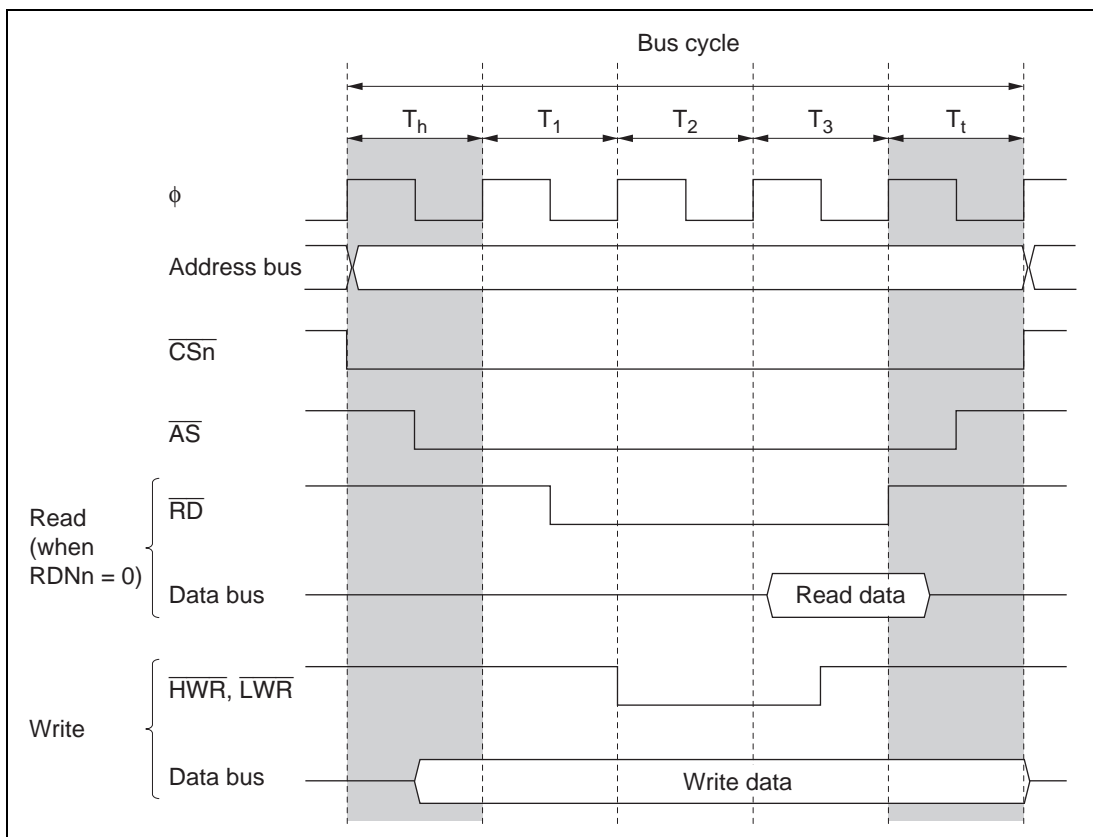

**Figure 6.19 Example of Read Strobe Timing**

### 6.5.6 Extension of Chip Select ( $\overline{CS}$ ) Assertion Period

Some external I/O devices require a setup time and hold time between address and  $\overline{CS}$  signals and strobe signals such as  $\overline{RD}$ ,  $\overline{HWR}$ , and  $\overline{LWR}$ . Settings can be made in the CSACR register to insert states in which only the  $\overline{CS}$ ,  $\overline{AS}$ , and address signals are asserted before and after a basic bus space access cycle. Extension of the  $\overline{CS}$  assertion period can be set for individual areas. With the  $\overline{CS}$  assertion extension period in write access, the data setup and hold times are less stringent since the write data is output to the data bus.

Figure 6.20 shows an example of the timing when the  $\overline{CS}$  assertion period is extended in basic bus 3-state access space.

**Figure 6.20 Example of Timing when Chip Select Assertion Period Is Extended**

Both extension state  $T_h$  inserted before the basic bus cycle and extension state  $T_l$  inserted after the basic bus cycle, or only one of these, can be specified for individual areas. Insertion or non-insertion can be specified for the  $T_h$  state with the upper 8 bits (CSXH7 to CSXH0) in the CSACR register, and for the  $T_l$  state with the lower 8 bits (CSXT7 to CSXT0).

## 6.6 Address/Data Multiplexed I/O Interface

If areas 6 and 7 of the external address space are specified as address/data multiplexed I/O space in this LSI, the address/data multiplexed I/O interfacing can be performed. In the address/data multiplexed I/O interface, peripheral LSIs that require address/data multiplexing can be connected directly to this LSI.

### 6.6.1 Setting Address/Data Multiplexed I/O Space

In the address/data multiplexed I/O interface, areas 6 and 7 are designated as the address/data multiplexed I/O space by setting the MPXE bit in MPXCR to 1.

### 6.6.2 Address/Data Multiplexing

With the address/data multiplexed I/O space, the data bus and address bus are multiplexed. Table 6.4 shows the relation between the bus width and corresponding address output.

**Table 6.4 Multiplexed Address/Data**

| Bus Width | Cycle   | Data Pins |      |      |      |      |      |     |     |     |     |     |     |     |     |     |     |
|-----------|---------|-----------|------|------|------|------|------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|           |         | AD15      | AD14 | AD13 | AD12 | AD11 | AD10 | AD9 | AD8 | AD7 | AD6 | AD5 | AD4 | AD3 | AD2 | AD1 | AD0 |
| 8 bits    | Address | A7        | A6   | A5   | A4   | A3   | A2   | A1  | A0  | —   | —   | —   | —   | —   | —   | —   |     |
|           | Data    | D15       | D14  | D13  | D12  | D11  | D10  | D9  | D8  | —   | —   | —   | —   | —   | —   | —   |     |
| 16 bits   | Address | A15       | A14  | A13  | A12  | A11  | A10  | A9  | A8  | A7  | A6  | A5  | A4  | A3  | A2  | A1  | A0  |
|           | Data    | D15       | D14  | D13  | D12  | D11  | D10  | D9  | D8  | D7  | D6  | D5  | D4  | D3  | D2  | D1  | D0  |

### 6.6.3 Data Bus

The bus width of the address/data multiplexed I/O space can be specified for either 8-bit access space or 16-bit access space by the ABW7 and ABW6 bits in ABWCRA. For the 8-bit access space, AD15 to AD8 are valid for both address and data. For the 16-bit access space, AD15 to AD0 are valid for both address and data. If the address/data multiplexed I/O space is accessed, the corresponding address will be output to the address bus. For details on access size and data alignment, see section 6.5.1, Data Size and Data Alignment.

### 6.6.4 Address Hold Signal

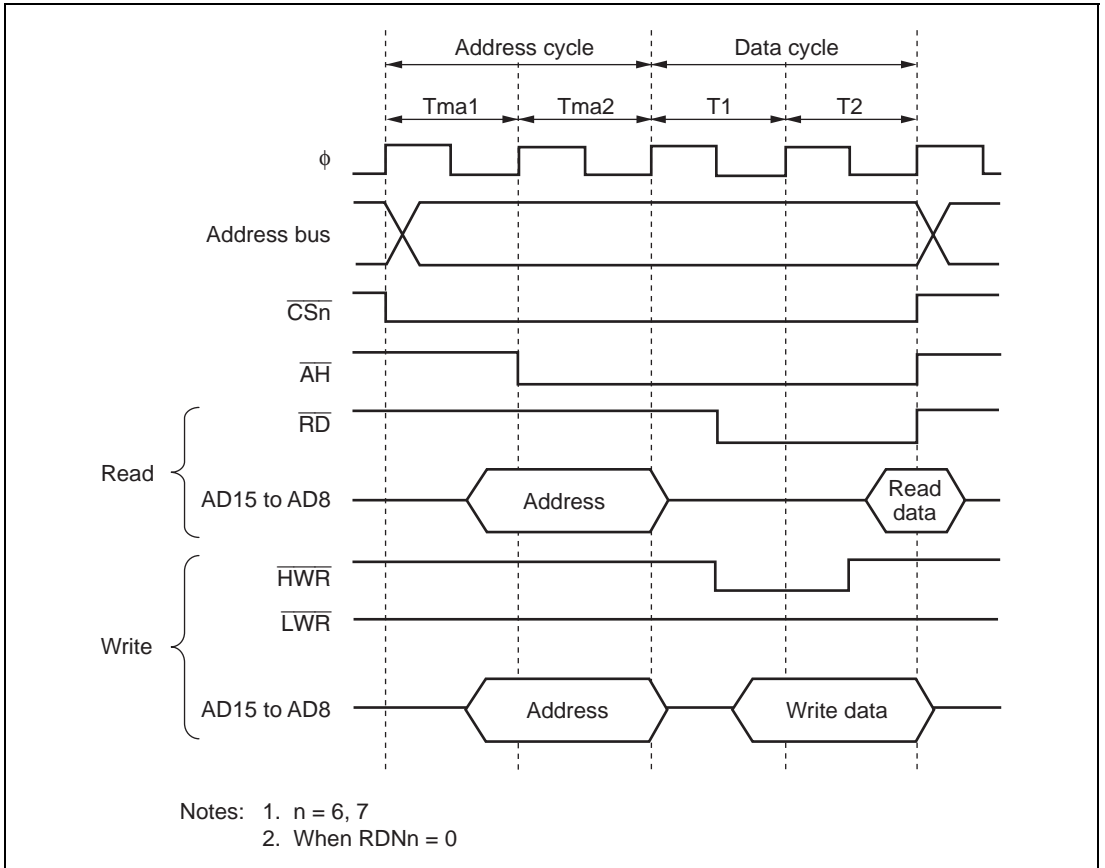

In the address/data multiplexed I/O space, a hold signal ( $\overline{AH}$ ) that indicates the timing for latching the address is output. The  $\overline{AH}$  output pin is multiplexed with the  $\overline{AS}$  output pin. When the external address space is specified as the address/data multiplexed I/O space, the multiplexed pin functions as the  $\overline{AH}$  output pin. Note however that the multiplexed pin will function as the  $\overline{AS}$  output pin until the address/data multiplexed I/O space is specified.

### 6.6.5 Basic Timing

The bus cycle in the address/data multiplexed I/O interface consists of an address cycle and a data cycle. The data cycle is based on the basic bus interface timing specified by ABWCR, ASTCR, WTCRAH, RDNCR, and CSACR.

#### (1) 8-Bit, 2-State Data Access Space

Figure 6.21 shows the bus timing for an 8-bit, 2-state data access space. When an 8-bit access space is accessed, the upper halves (AD15 to AD8) of both the address bus and data bus are used. Wait states cannot be inserted in the data cycle.

**Figure 6.21 Bus Timing for 8-Bit, 2-State Data Access Space**

## (2) 8-Bit, 3-State Data Access Space

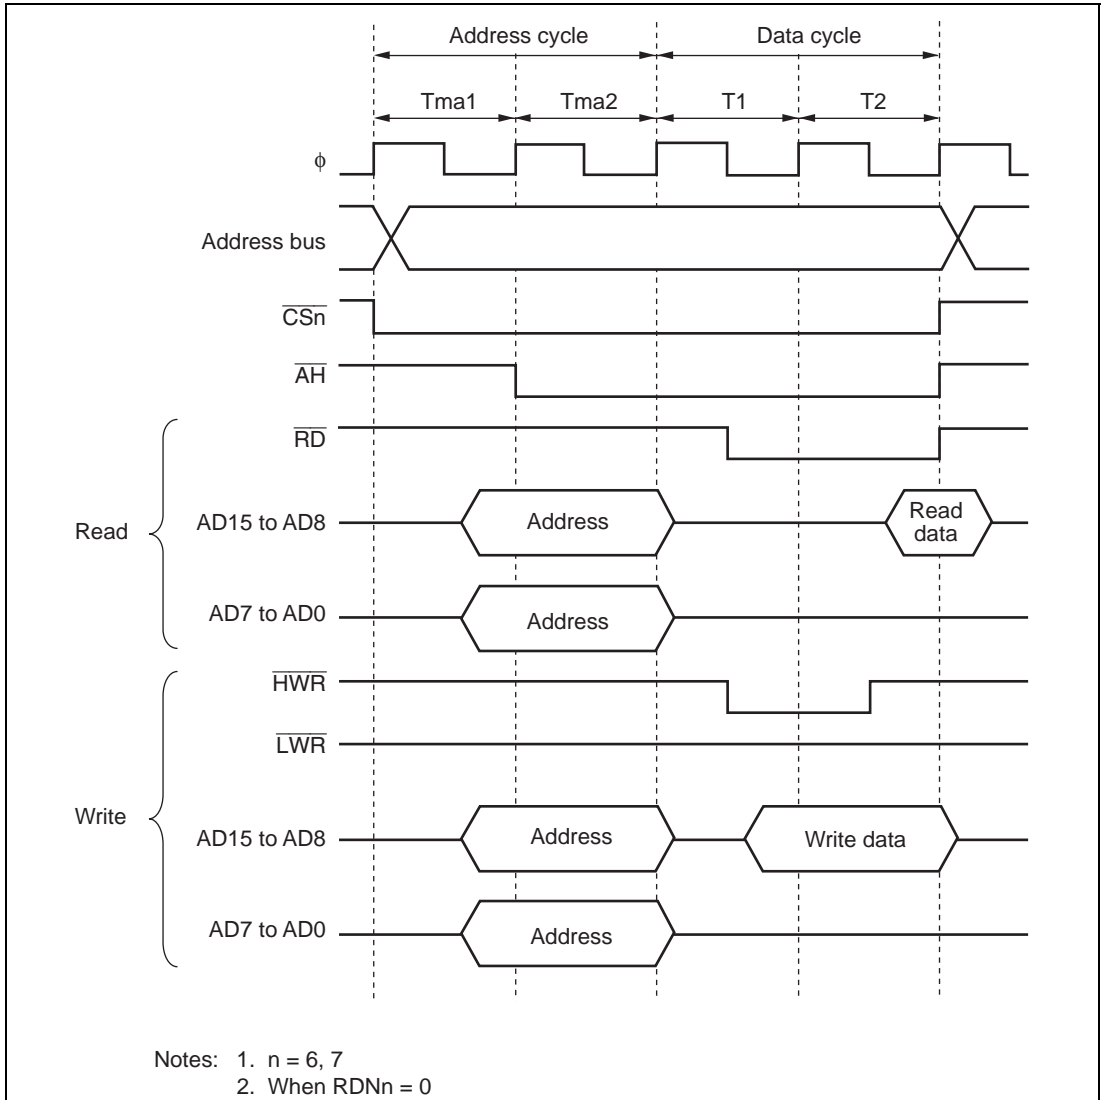

Figure 6.22 shows the bus timing for an 8-bit, 3-state data access space. When an 8-bit access space is accessed, the upper halves (AD15 to AD8) of both the address bus and data bus are used. Wait states can be inserted in the data cycle.

**Figure 6.22 Bus Timing for 8-Bit, 3-State Data Access Space**

### (3) 16-Bit, 2-State Data Access Space

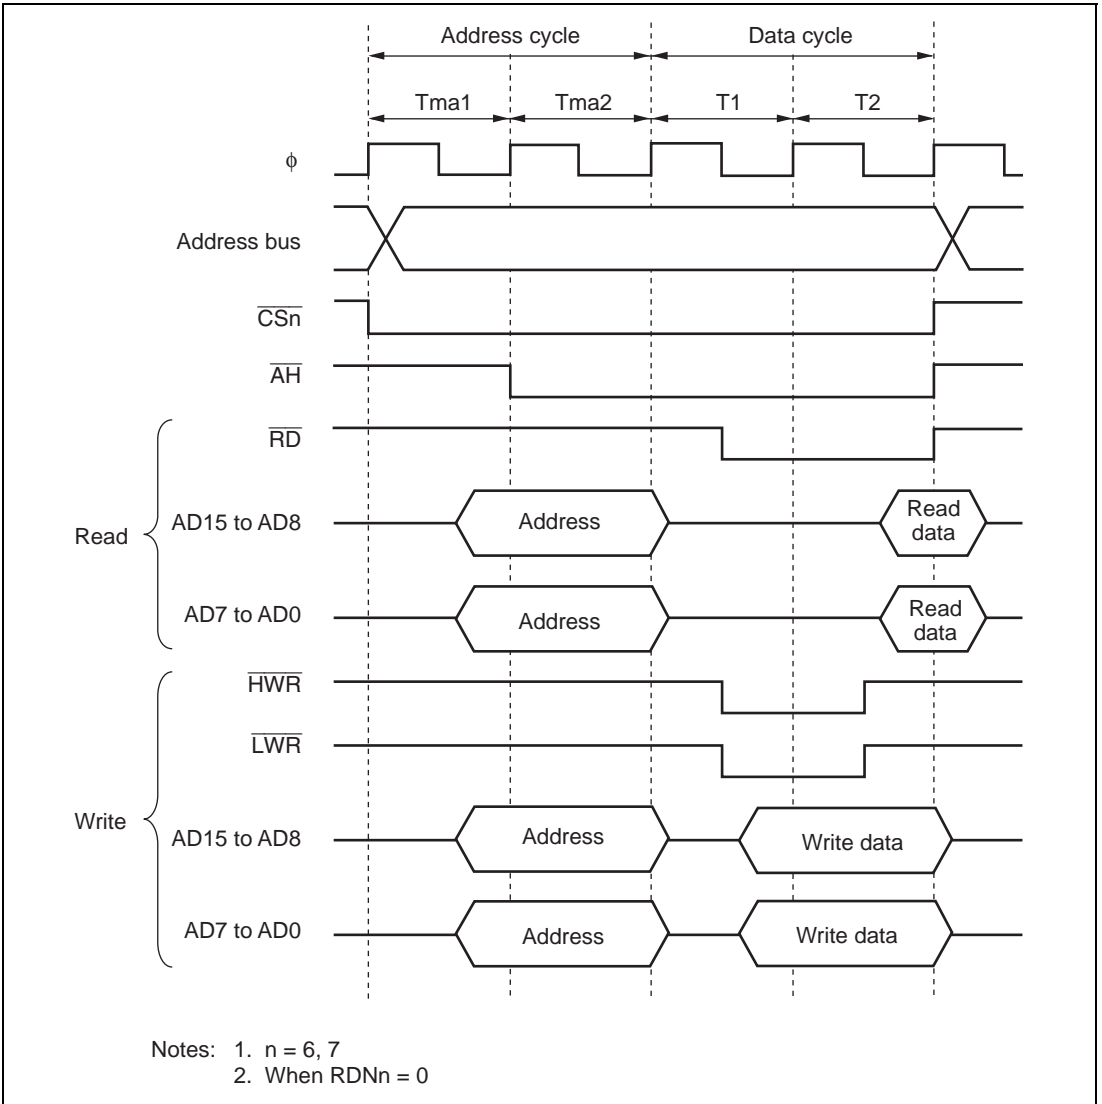

Figures 6.23 to 6.25 show bus timings for a 16-bit, 2-state data access space. When a 16-bit access space is accessed, the entire address bus (AD15 to AD0) is used for all addresses, and the upper half (AD15 to AD8) of the data bus is used for even addresses and the lower half (AD7 to AD0) of the data bus is used for odd addresses. Wait states cannot be inserted in the data cycle.

**Figure 6.23 Bus Timing for 16-Bit, 2-State Data Access Space (Even Address Byte Access)**

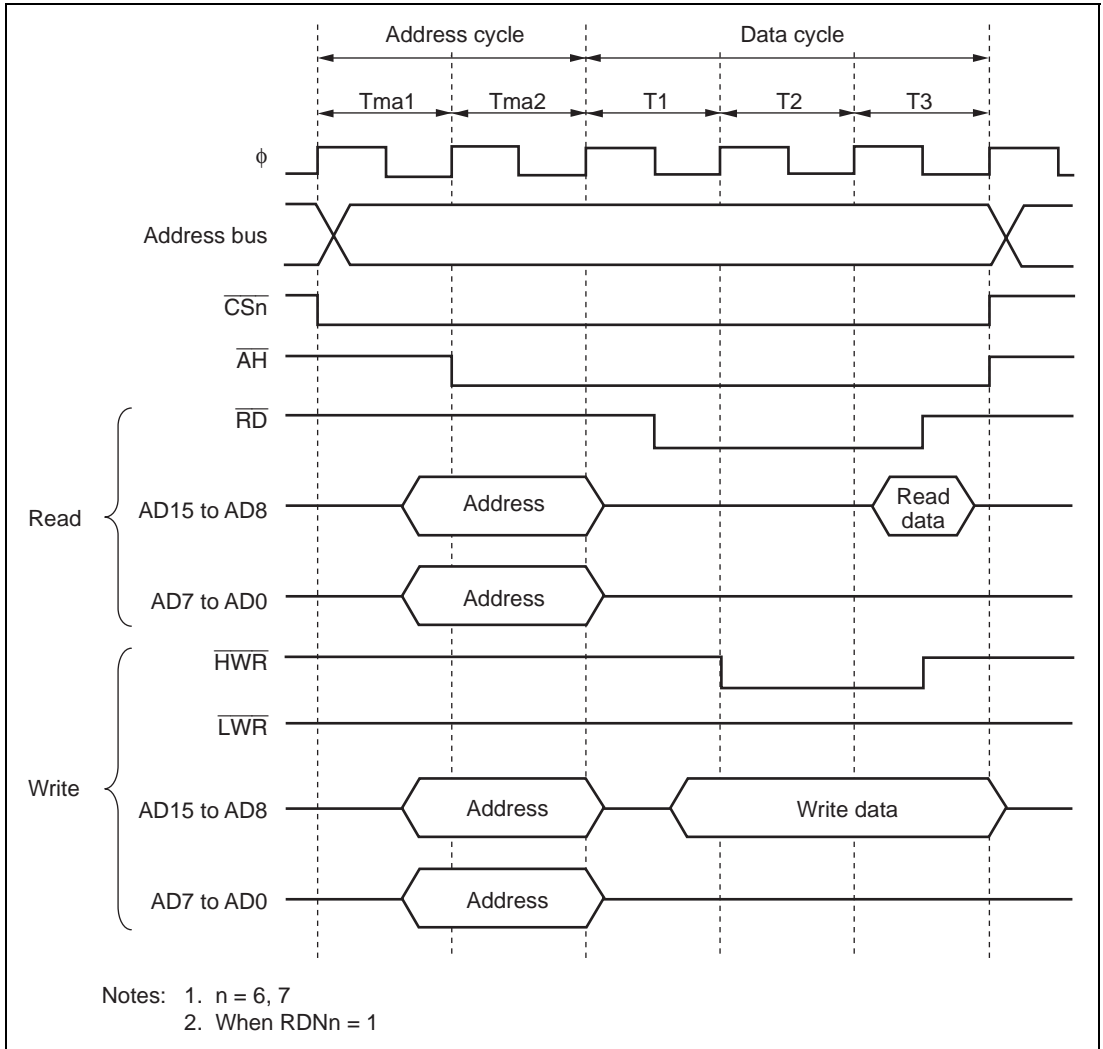

**Figure 6.24 Bus Timing for 16-Bit, 2-State Data Access Space (Odd Address Byte Access)**

**Figure 6.25 Bus Timing for 16-Bit, 2-State Data Access Space (Word Access)**

#### (4) 16-Bit, 3-State Data Access Space

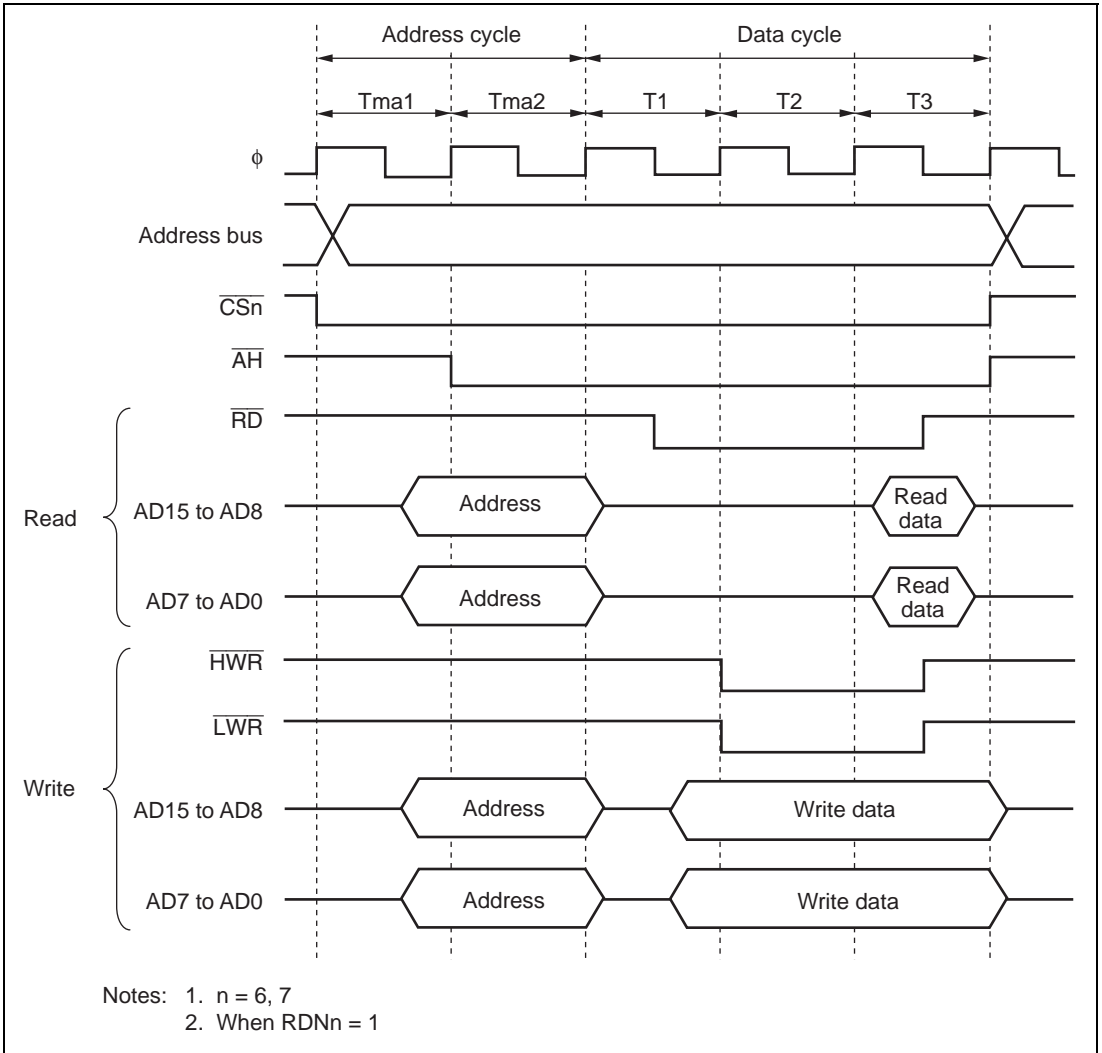

Figures 6.26 to 6.28 show bus timings for a 16-bit, 3-state data access space. When a 16-bit access space is accessed, the entire address bus (AD15 to AD0) is used for all addresses, and the upper half (AD15 to AD8) of the data bus is used for even addresses and the lower half (AD7 to AD0) of the data bus is used for odd addresses. Wait states can be inserted in the data cycle.

**Figure 6.26 Bus Timing for 16-Bit, 3-State Data Access Space  
(Even Address Byte Access)**

**Figure 6.27 Bus Timing for 16-Bit, 3-State Data Access Space (Odd Address Byte Access)**

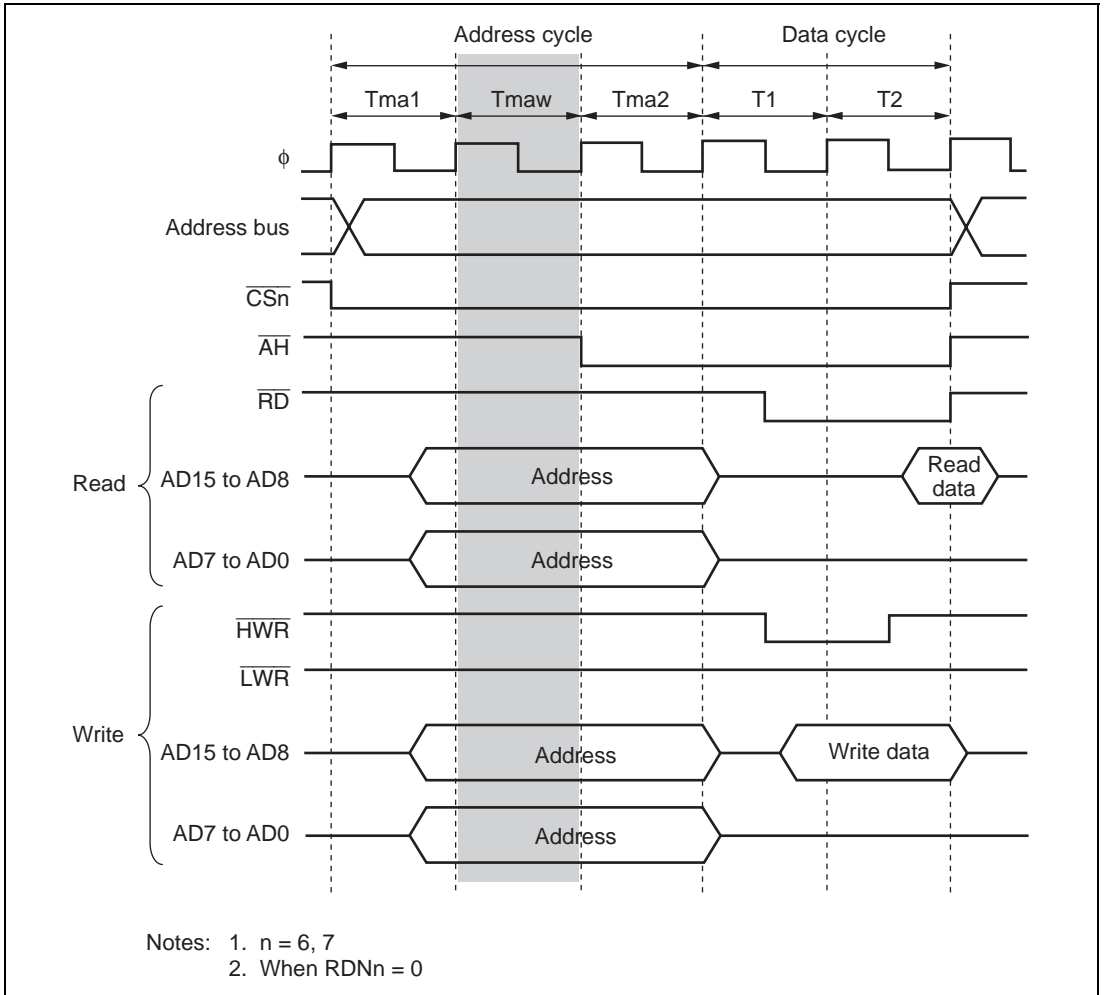

**Figure 6.28 Bus Timing for 16-Bit, 3-State Data Access Space (Word Access)**

### 6.6.6 Wait Control

#### (1) Address Cycle

A single address wait cycle  $T_{maw}$  can be inserted between  $T_{ma1}$  and  $T_{ma2}$  cycles by setting the ADDEX bit in MPXCR to 1. Figure 6.29 shows the access timing when the address cycle is three cycles.

**Figure 6.29 Example of Access Timing with Address Wait**

## (2) Data Cycle

In the data cycle, program wait insertion and pin wait insertion by the  $\overline{\text{WAIT}}$  pin are enabled in the same way as in the basic bus interface. For details, refer to section 6.5.4, Wait Control. Wait control settings do not affect the address cycles.

### 6.6.7 Read Strobe ( $\overline{\text{RD}}$ ) Timing

In the address/data multiplexed I/O interface, the read strobe timing of data cycles can be modified in the same way as in the basic bus interface. For details, refer to section 6.5.5, Read Strobe ( $\overline{\text{RD}}$ ) Timing. Figure 6.30 shows an example when the read strobe timing is modified.

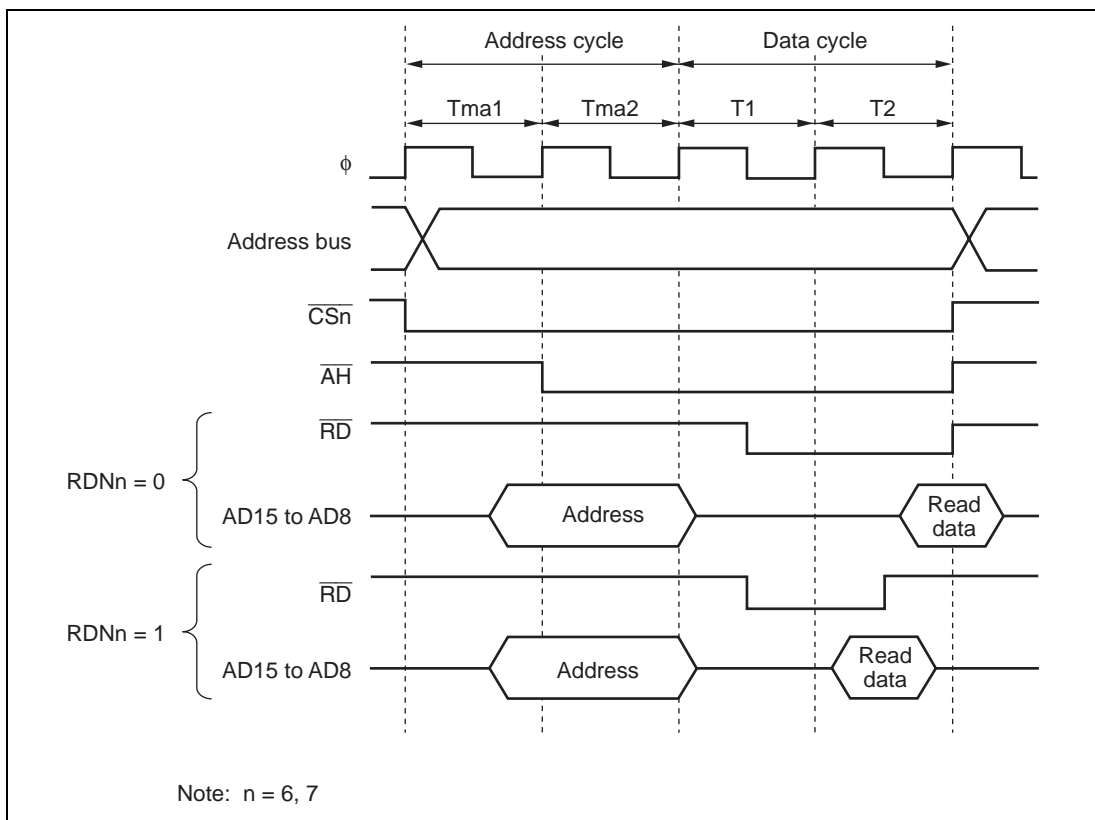

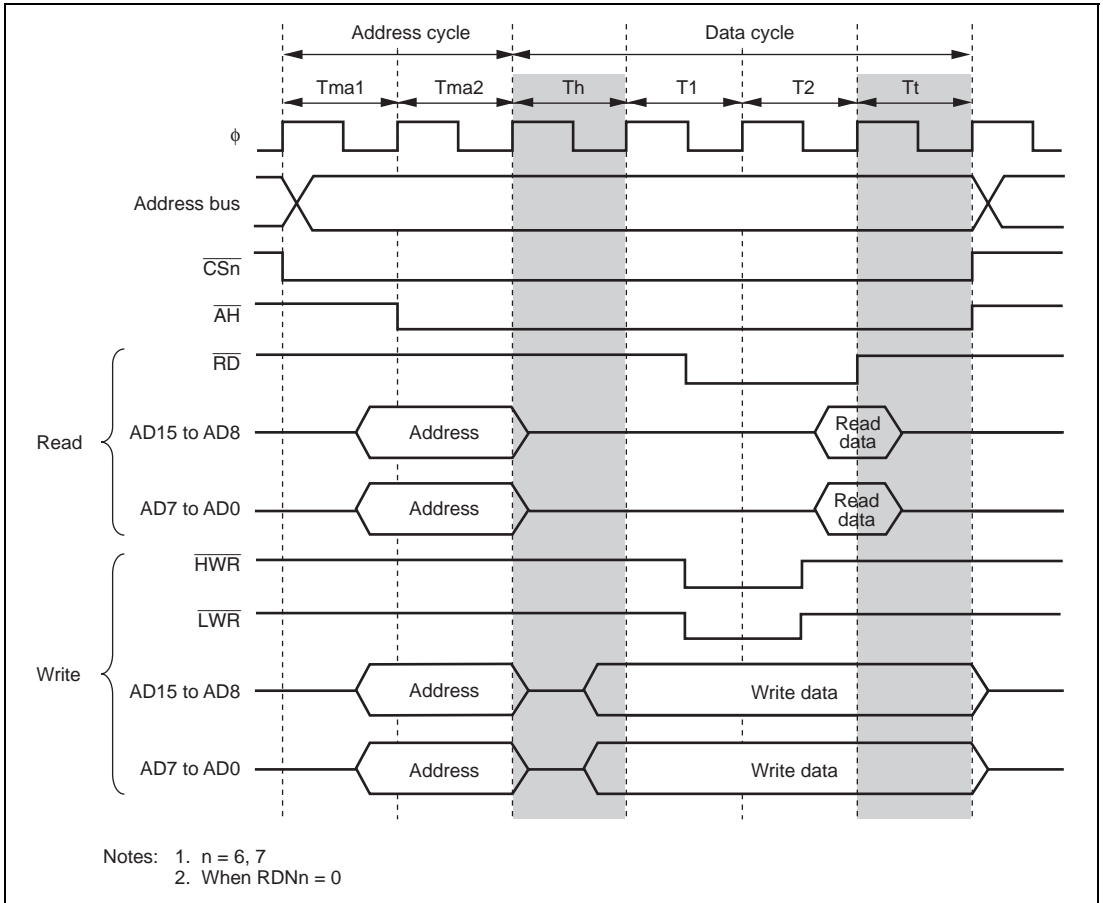

Figure 6.30 Example of Read Strobe Timing

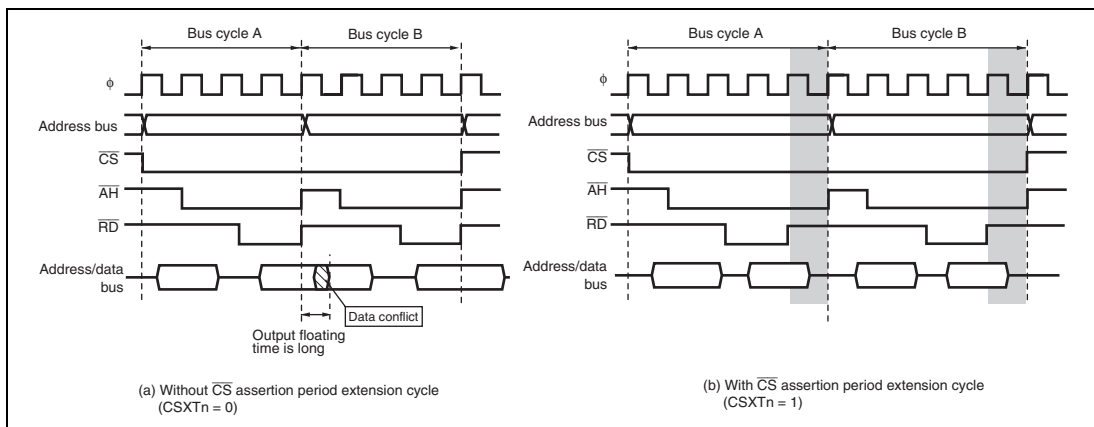

### 6.6.8 Extension of Chip Select ( $\overline{CS}$ ) Assertion Period in Data Cycle

In the address/data multiplexed I/O interface, extension cycles can be inserted before and after the data cycle. For details, see section 6.5.6, Extension of Chip Select ( $\overline{CS}$ ) Assertion Period. Figure 6.31 shows an example of the timing when the chip select assertion period is extended in the data cycle.

**Figure 6.31 Example of Timing when Chip Select Assertion Period Is Extended in Data Cycle**

When consecutively reading from the same area connected to a peripheral LSI whose output floating time is long, data outputs from the peripheral LSI may conflict with address outputs from this LSI. The data conflict can be avoided by inserting the  $\overline{\text{CS}}$  assertion period extension cycle after the access cycle. Figure 6.32 shows an example of the operation. In the figure, both bus cycles A and B are read access cycles to the same area which is address/data multiplexed I/O space. (a) shows an example of conflict occurring between data outputs from the peripheral LSI whose output floating time is long and address outputs from this LSI because the  $\overline{\text{CS}}$  assertion period extension cycle is not inserted. (b) shows an example of the data conflict being avoided by inserting the  $\overline{\text{CS}}$  assertion period extension cycle.

**Figure 6.32 Consecutive Read Accesses to Same Area  
(Address/Data Multiplexed I/O Space)**

## 6.7 DRAM Interface

In this LSI, external space areas 2 to 5 can be designated as DRAM space, and DRAM interfacing performed. The DRAM interface allows DRAM to be directly connected to this LSI. A DRAM space of 2, 4, or 8 Mbytes can be set by means of bits RMTS2 to RMTS0 in DRAMCR. Burst operation is also possible, using fast page mode.

Note: The DRAM interface is not supported by the 5-V version.

### 6.7.1 Setting DRAM Space

Areas 2 to 5 are designated as DRAM space by setting bits RMTS2 to RMTS0 in DRAMCR. The relation between the settings of bits RMTS2 to RMTS0 and DRAM space is shown in table 6.5. Possible DRAM space settings are: one area (area 2), two areas (areas 2 and 3), four areas (areas 2 to 5), and continuous area (areas 2 to 5).

**Table 6.5 Relation between Settings of Bits RMTS2 to RMTS0 and DRAM Space**

| RMTS2 | RMTS1 | RMTS0      | Area 5                                      | Area 4                | Area 3                | Area 2                |
|-------|-------|------------|---|-----------------------|-----------------------|-----------------------|
| 0     | 0     | 1          | Normal space                                | Normal space          | Normal space          | DRAM space            |
|       |       | 1          | Normal space                                | Normal space          | DRAM space            | DRAM space            |
|       | 1     | DRAM space | DRAM space                                  | DRAM space            | DRAM space            |                       |
| 1     | 0     | 0          | Continuous synchronous DRAM space*          |                       |                       |                       |
|       |       | 1          | Mode register settings of synchronous DRAM* |                       |                       |                       |
|       | 1     | 0          | Reserved (setting prohibited)               |                       |                       |                       |
|       |       | 1          | Continuous DRAM space                       | Continuous DRAM space | Continuous DRAM space | Continuous DRAM space |

Note: \* Reserved (setting prohibited) in the H8S/2426 Group and H8S/2424 Group.

With continuous DRAM space,  $\overline{\text{RAS2}}$  is valid. The bus specifications (bus width, number of wait states, etc.) for continuous DRAM space conform to the settings for area 2.

### 6.7.2 Address Multiplexing

With DRAM space, the row address and column address are multiplexed. In address multiplexing, the size of the shift of the row address is selected with bits MXC2 to MXC0 in DRAMCR. Table 6.6 shows the relation between the settings of MXC2 to MXC0 and the shift size.

The MXC2 bit should be cleared to 0 when the DRAM interface is used.

**Table 6.6 Relation between Settings of Bits MXC2 to MXC0 and Address Multiplexing**

|                | DRAMCR |      |      | Shift Size                    | Address Pins |            |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
|----------------|--------|------|------|-------------------------------|--------------|------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|                | MXC2   | MXC1 | MXC0 |                               | A23 to A16   | A15        | A14 | A13 | A12 | A11 | A10 | A9  | A8  | A7  | A6  | A5  | A4  | A3  | A2  | A1  | A0  |     |
| Row address    | 0      | 0    | 0    | 8 bits                        | A23 to A16   | A23        | A22 | A21 | A20 | A19 | A18 | A17 | A16 | A15 | A14 | A13 | A12 | A11 | A10 | A9  | A8  |     |
|                |        |      | 1    | 9 bits                        | A23 to A16   | A15        | A23 | A22 | A21 | A20 | A19 | A18 | A17 | A16 | A15 | A14 | A13 | A12 | A11 | A10 | A9  |     |
|                |        |      | 1    | 0                             | 10 bits      | A23 to A16 | A15 | A14 | A23 | A22 | A21 | A20 | A19 | A18 | A17 | A16 | A15 | A14 | A13 | A12 | A11 | A10 |
|                |        |      | 1    | 11 bits                       | A23 to A16   | A15        | A14 | A13 | A23 | A22 | A21 | A20 | A19 | A18 | A17 | A16 | A15 | A14 | A13 | A12 | A11 |     |
|                | 1      | ×    | ×    | Reserved (setting prohibited) |              |            |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
| Column address | 0      | ×    | ×    | —                             | A23 to A16   | A15        | A14 | A13 | A12 | A11 | A10 | A9  | A8  | A7  | A6  | A5  | A4  | A3  | A2  | A1  | A0  |     |
|                | 1      | ×    | ×    | Reserved (setting prohibited) |              |            |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

[Legend]

×: Don't care.

### 6.7.3 Data Bus

If a bit in ABWCR corresponding to an area designated as DRAM space is set to 1, that area is designated as 8-bit DRAM space; if the bit is cleared to 0, the area is designated as 16-bit DRAM space. In 16-bit DRAM space, ×16-bit configuration DRAM can be connected directly.

In 8-bit DRAM space the upper half of the data bus, D15 to D8, is enabled, while in 16-bit DRAM space both the upper and lower halves of the data bus, D15 to D0, are enabled.

Access sizes and data alignment are the same as for the basic bus interface: see section 6.5.1, Data Size and Data Alignment.

### 6.7.4 Pins Used for DRAM Interface

Table 6.7 shows the pins used for DRAM interfacing and their functions.

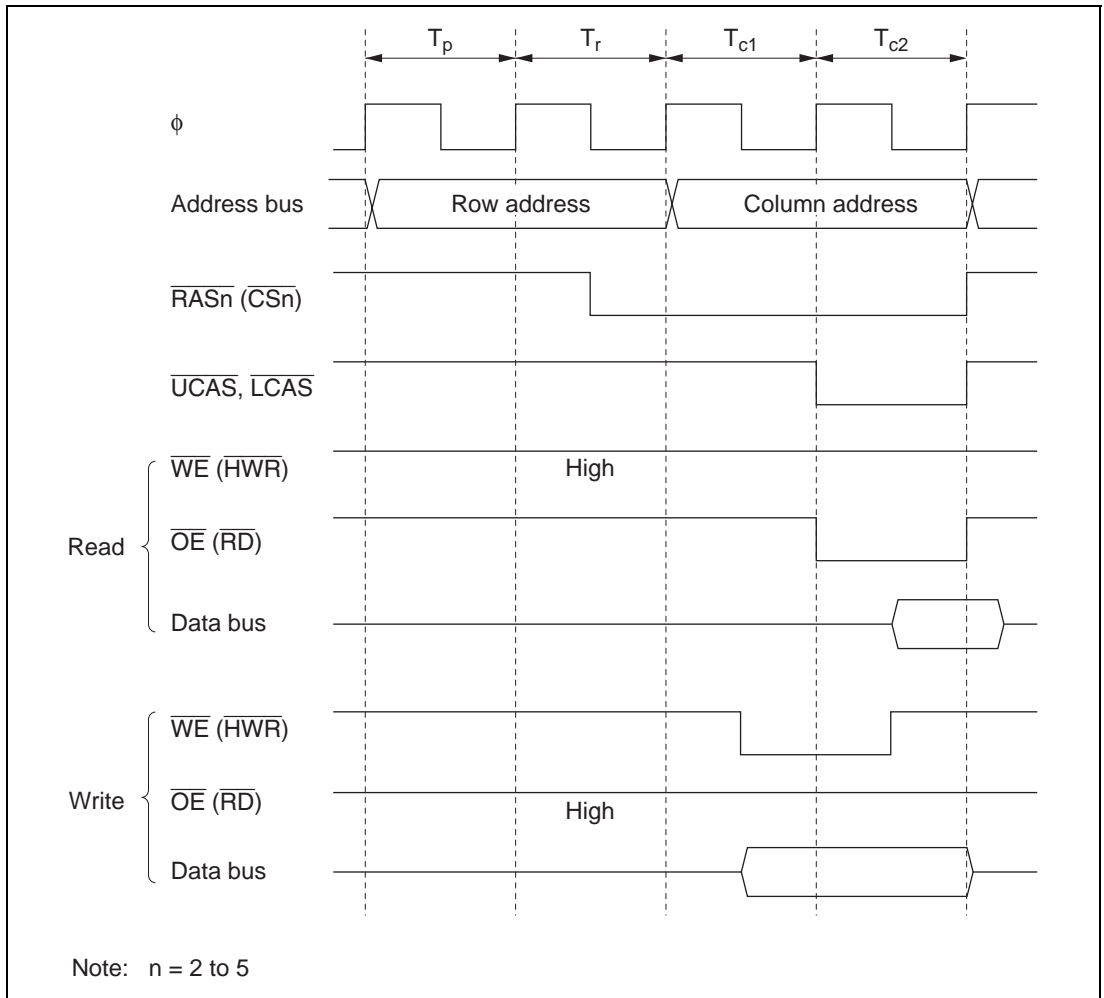

**Table 6.7 DRAM Interface Pins**

| Pin  | With DRAM Setting        | Name                        | I/O    | Function   |
|--|--------------------------|-----------------------------|--------|--|
| $\overline{\text{HWR}}$                      | $\overline{\text{WE}}$   | Write enable                | Output | Write enable for DRAM space access   |
| $\overline{\text{CS2}}$                      | $\overline{\text{RAS2}}$ | Row address strobe 2        | Output | Row address strobe when area 2 is designated as DRAM space or row address strobe when areas 2 to 5 are designated as continuous DRAM space |
| $\overline{\text{CS3}}$                      | $\overline{\text{RAS3}}$ | Row address strobe 3        | Output | Row address strobe when area 3 is designated as DRAM space   |
| $\overline{\text{CS4}}$                      | $\overline{\text{RAS4}}$ | Row address strobe 4        | Output | Row address strobe when area 4 is designated as DRAM space   |
| $\overline{\text{CS5}}$                      | $\overline{\text{RAS5}}$ | Row address strobe 5        | Output | Row address strobe when area 5 is designated as DRAM space   |
| $\overline{\text{UCAS}}$                     | $\overline{\text{UCAS}}$ | Upper column address strobe | Output | Upper column address strobe for 16-bit DRAM space access or column address strobe for 8-bit DRAM space access                              |
| $\overline{\text{LCAS}}$                     | $\overline{\text{LCAS}}$ | Lower column address strobe | Output | Lower column address strobe signal for 16-bit DRAM space access  |
| $\overline{\text{RD}}, \overline{\text{OE}}$ | $\overline{\text{OE}}$   | Output enable               | Output | Output enable signal for DRAM space access   |
| $\overline{\text{WAIT}}$                     | $\overline{\text{WAIT}}$ | Wait                        | Input  | Wait request signal  |
| A15 to A0                                    | A15 to A0                | Address pins                | Output | Row address/column address multiplexed output  |
| D15 to D0                                    | D15 to D0                | Data pins                   | I/O    | Data input/output pins   |

## 6.7.5 Basic Timing

Figure 6.33 shows the basic access timing for DRAM space.

The four states of the basic timing consist of one  $T_p$  (precharge cycle) state, one  $T_r$  (row address output cycle) state, and the  $T_{c1}$  and two  $T_{c2}$  (column address output cycle) states.

**Figure 6.33 DRAM Basic Access Timing (RAST = 0, CAST = 0)**

When DRAM space is accessed, the  $\overline{RD}$  signal is output as the  $\overline{OE}$  signal for DRAM. When connecting DRAM provided with an EDO page mode, the  $\overline{OE}$  signal should be connected to the ( $\overline{OE}$ ) pin of the DRAM. Setting the OEE bit to 1 in DRAMCR enables the  $\overline{OE}$  signal for DRAM space to be output from a dedicated  $\overline{OE}$  pin. In this case, the  $\overline{OE}$  signal for DRAM space is output from both the  $\overline{RD}$  pin and the ( $\overline{OE}$ ) pin, but in external read cycles for other than DRAM space, the signal is output only from the  $\overline{RD}$  pin.

### 6.7.6 Column Address Output Cycle Control

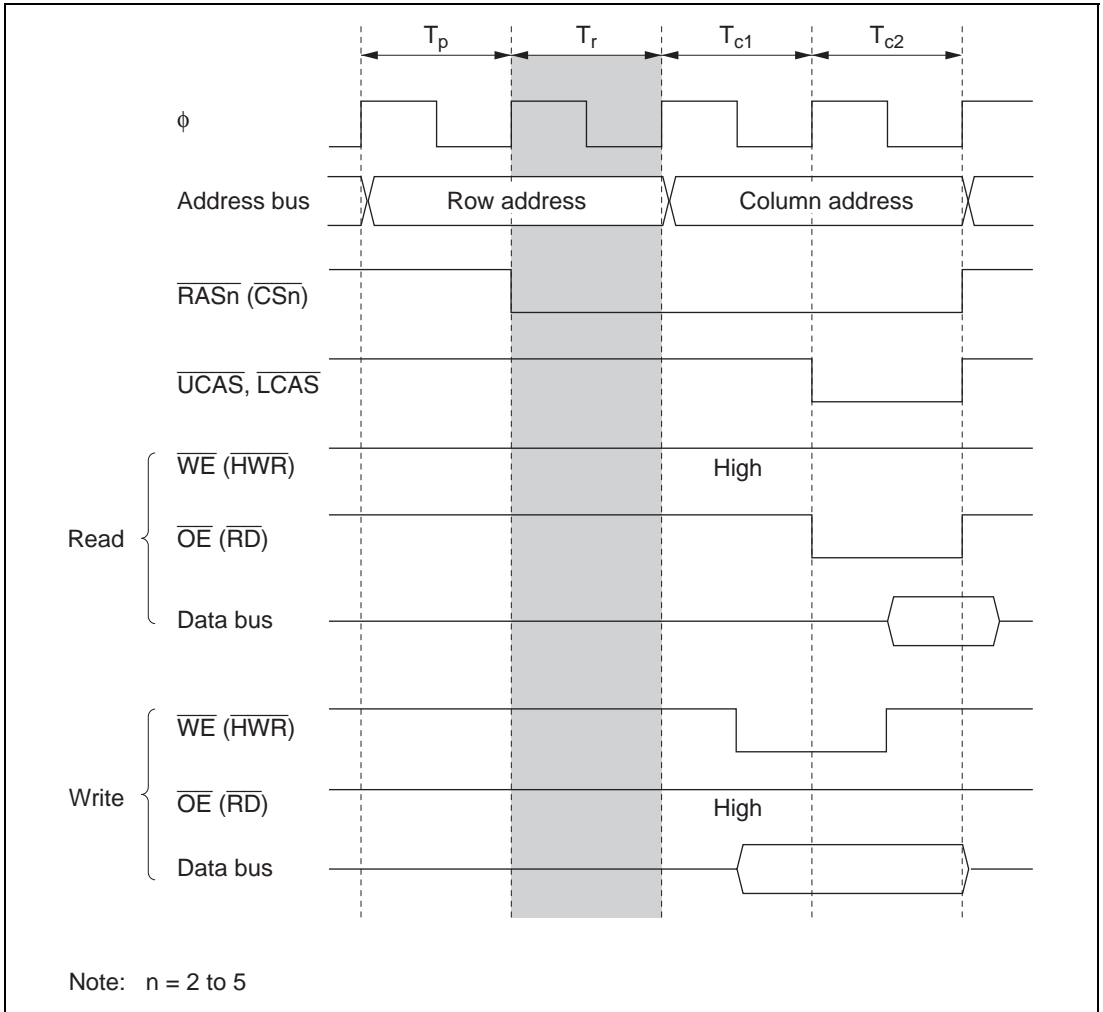

The column address output cycle can be changed from 2 states to 3 states by setting the CAST bit to 1 in DRAMCR. Use the setting that gives the optimum specification values ( $\overline{\text{CAS}}$  pulse width, etc.) according to the DRAM connected and the operating frequency of this LSI. Figure 6.34 shows an example of the timing when a 3-state column address output cycle is selected.

**Figure 6.34 Example of Access Timing with 3-State Column Address Output Cycle (RAST = 0)**

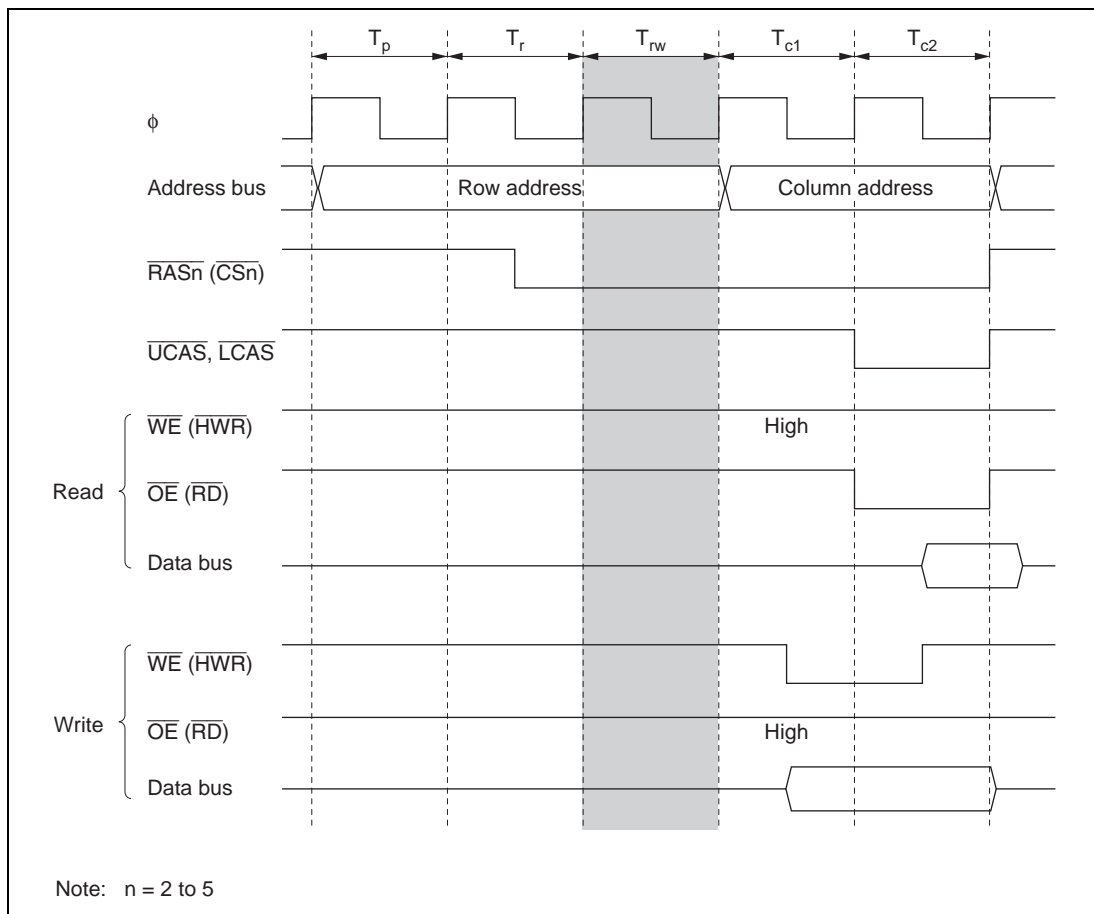

### 6.7.7 Row Address Output State Control

If the RAST bit is set to 1 in DRAMCR, the  $\overline{\text{RAS}}$  signal goes low from the beginning of the  $T_r$  state, and the row address hold time and DRAM read access time are changed relative to the fall of the  $\overline{\text{RAS}}$  signal. Use the optimum setting according to the DRAM connected and the operating frequency of this LSI. Figure 6.35 shows an example of the timing when the  $\overline{\text{RAS}}$  signal goes low from the beginning of the  $T_r$  state.

**Figure 6.35 Example of Access Timing when RAS Signal Goes Low from Beginning of  $T_r$  State (CAST = 0)**

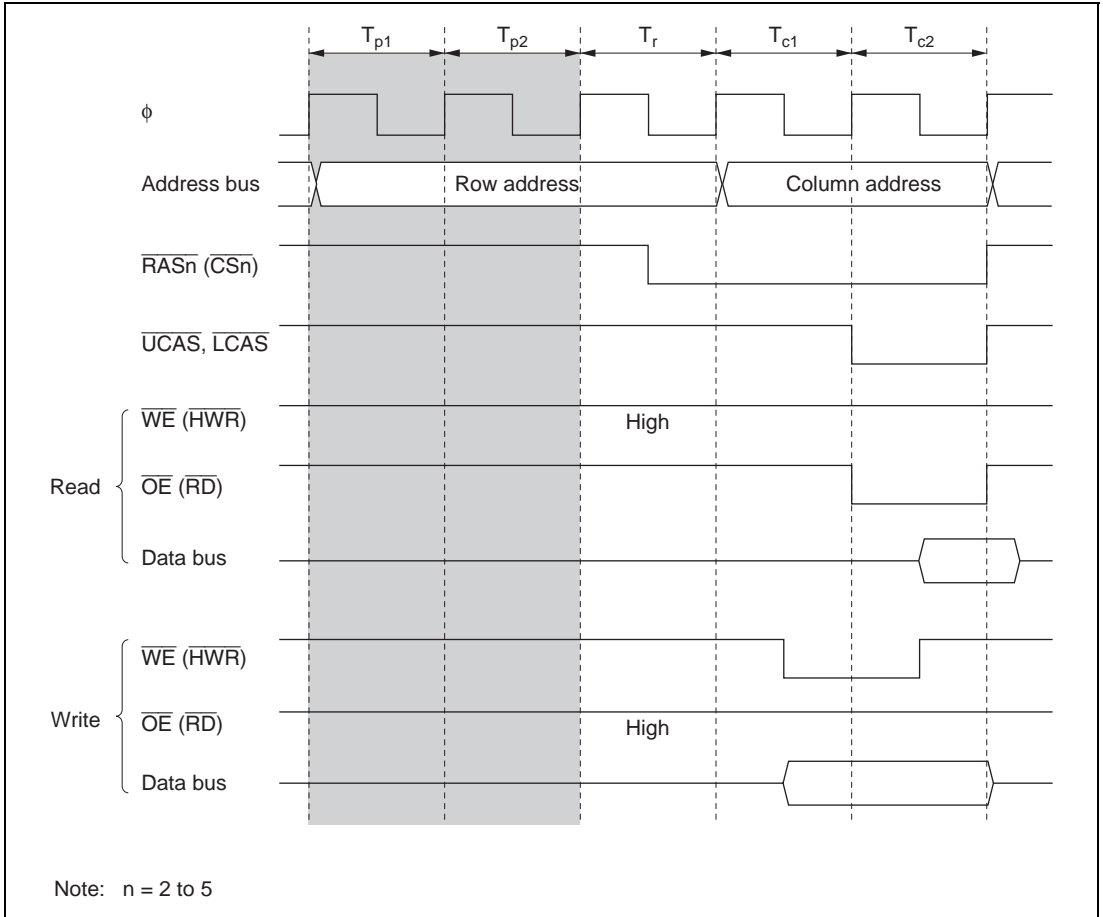

If a row address hold time or read access time is necessary, making a setting in bits RCD1 and RCD0 in DRACCR allows from one to three  $T_{rw}$  states, in which row address output is maintained, to be inserted between the  $T_r$  cycle, in which the  $\overline{\text{RAS}}$  signal goes low, and the  $T_{c1}$  cycle, in which the column address is output. Use the setting that gives the optimum row address signal hold time relative to the falling edge of the  $\overline{\text{RAS}}$  signal according to the DRAM connected and the operating frequency of this LSI. Figure 6.36 shows an example of the timing when one  $T_{rw}$  state is set.

**Figure 6.36 Example of Timing with One Row Address Output Maintenance State (RAST = 0, CAST = 0)**

## 6.7.8 Precharge State Control

When DRAM is accessed, a  $\overline{\text{RAS}}$  precharge time must be secured. With this LSI, one  $T_p$  state is always inserted when DRAM space is accessed. From one to four  $T_p$  states can be selected by setting bits TPC1 and TPC0 in DRACCR. Set the optimum number of  $T_p$  cycles according to the DRAM connected and the operating frequency of this LSI. Figure 6.37 shows the timing when two  $T_p$  states are inserted. The setting of bits TPC1 and TPC0 is also valid for  $T_p$  states in refresh cycles.

**Figure 6.37 Example of Timing with Two-State Precharge Cycle  
( $\text{RAST} = 0$ ,  $\text{CAST} = 0$ )**

### 6.7.9 Wait Control

There are two ways of inserting wait states in a DRAM access cycle: program wait insertion and pin wait insertion using the  $\overline{\text{WAIT}}$  pin.

Wait states are inserted to extend the  $\overline{\text{CAS}}$  assertion period in a read access to DRAM space, and to extend the write data setup time relative to the falling edge of  $\overline{\text{CAS}}$  in a write access.

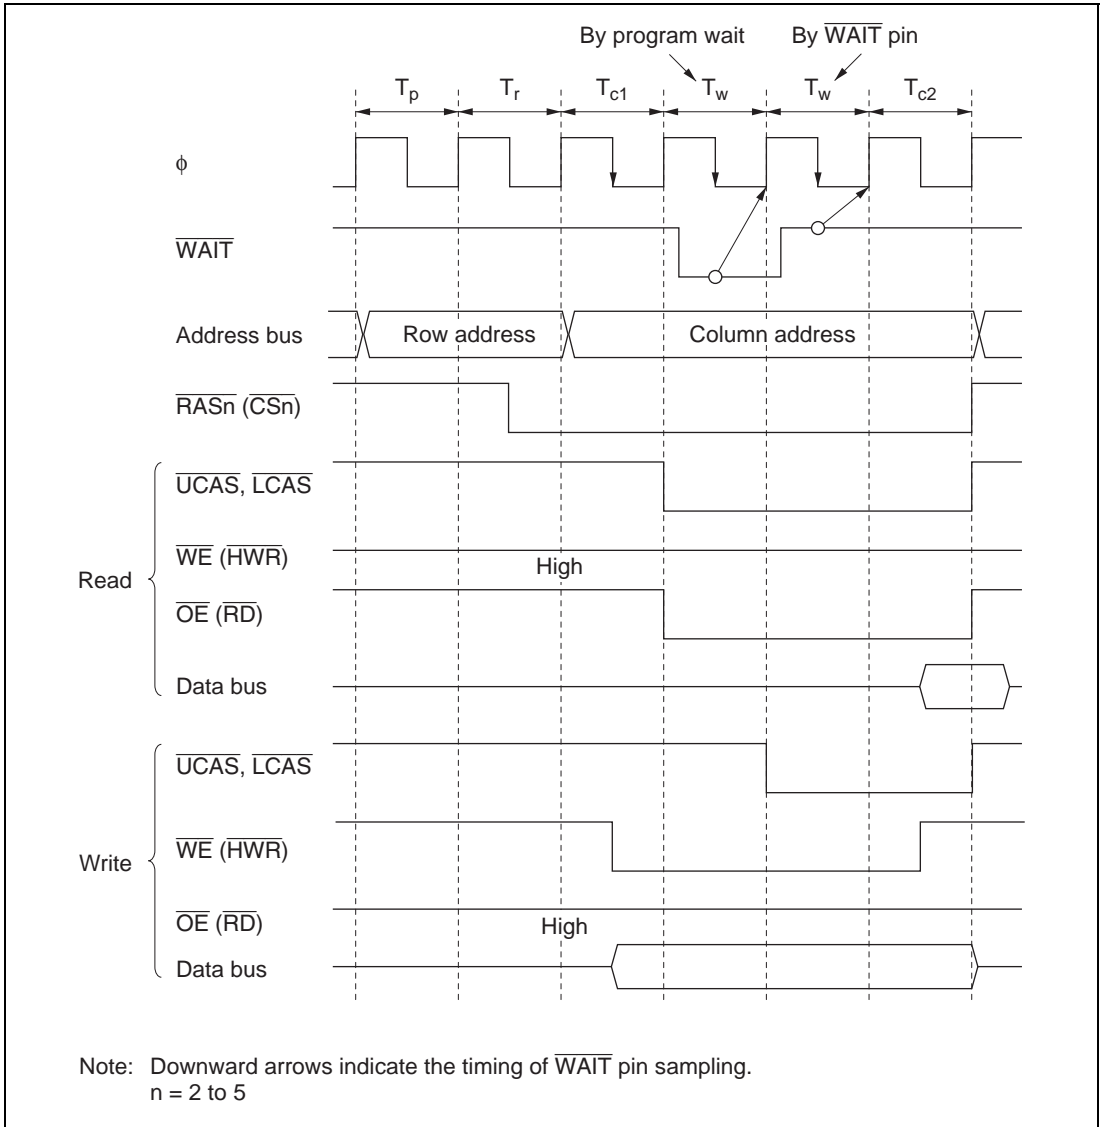

#### (1) Program Wait Insertion

When the bit in ASTCR corresponding to an area designated as DRAM space is set to 1, from 0 to 7 wait states can be inserted automatically between the  $T_{c1}$  state and  $T_{c2}$  state, according to the settings in WTCR.

#### (2) Pin Wait Insertion

When the WAITE bit in BCR is set to 1 and the ASTCR bit is set to 1, wait input by means of the  $\overline{\text{WAIT}}$  pin is enabled. When DRAM space is accessed in this state, a program wait ( $T_w$ ) is first inserted. If the  $\overline{\text{WAIT}}$  pin is low at the falling edge of  $\phi$  in the last  $T_{c1}$  or  $T_w$  state, another  $T_w$  state is inserted. If the  $\overline{\text{WAIT}}$  pin is held low,  $T_w$  states are inserted until it goes high.

Figures 6.38 and 6.39 show examples of wait cycle insertion timing in the case of 2-state and 3-state column address output cycles.

**Figure 6.38 Example of Wait State Insertion Timing  
 (2-State Column Address Output)**

**Figure 6.39 Example of Wait State Insertion Timing (3-State Column Address Output)**

### 6.7.10 Byte Access Control

When DRAM with a  $\times 16$ -bit configuration is connected, the 2-CAS access method is used for the control signals needed for byte access. Figure 6.40 shows the control timing for 2-CAS access, and figure 6.41 shows an example of 2-CAS DRAM connection.

**Figure 6.40 2-CAS Control Timing**  
(Upper Byte Write Access: RAST = 0, CAST = 0)

**Figure 6.41 Example of 2-CAS DRAM Connection**

### 6.7.11 Burst Operation

With DRAM, in addition to full access (normal access) in which data is accessed by outputting a row address for each access, a fast page mode is also provided which can be used when making consecutive accesses to the same row address. This mode enables fast (burst) access of data by simply changing the column address after the row address has been output. Burst access can be selected by setting the BE bit to 1 in DRAMCR.

#### (1) Burst Access (Fast Page Mode)

Figures 6.42 and 6.43 show the operation timing for burst access. When there are consecutive access cycles for DRAM space, the  $\overline{\text{CAS}}$  signal and column address output cycles (two states) continue as long as the row address is the same for consecutive access cycles. The row address used for the comparison is set with bits MXC2 to MXC0 in DRAMCR.

**Figure 6.42 Operation Timing in Fast Page Mode  
(RAST = 0, CAST = 0)**

**Figure 6.43 Operation Timing in Fast Page Mode  
(RAST = 0, CAST = 1)**

The bus cycle can also be extended in burst access by inserting wait states. The wait state insertion method and timing are the same as for full access. For details see section 6.7.9, Wait Control.

## (2) RAS Down Mode and RAS Up Mode

Even when burst operation is selected, it may happen that access to DRAM space is not continuous, but is interrupted by access to another space. In this case, if the  $\overline{\text{RAS}}$  signal is held low during the access to the other space, burst operation can be resumed when the same row address in DRAM space is accessed again.

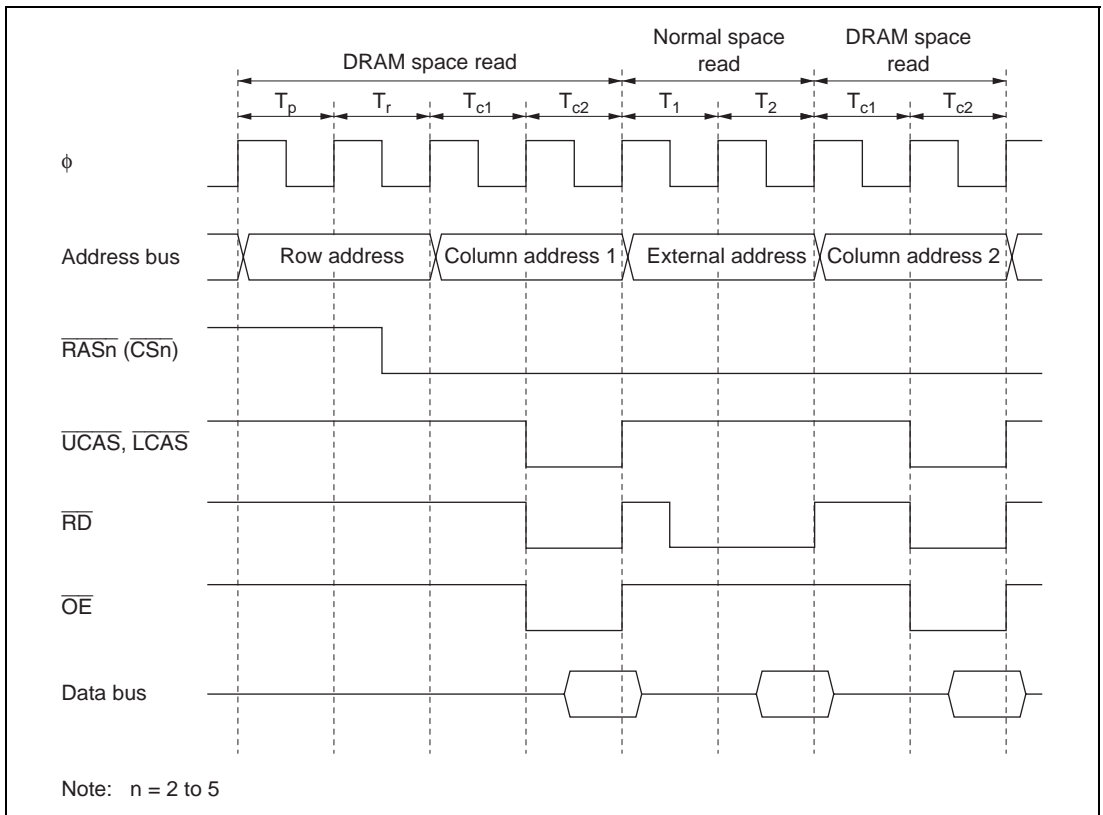

- **RAS Down Mode**

To select RAS down mode, set both the RCDM bit and the BE bit to 1 in DRAMCR. If access to DRAM space is interrupted and another space is accessed, the  $\overline{\text{RAS}}$  signal is held low during the access to the other space, and burst access is performed when the row address of the next DRAM space access is the same as the row address of the previous DRAM space access. Figure 6.44 shows an example of the timing in RAS down mode.

Note, however, that the  $\overline{\text{RAS}}$  signal will go high if:

- a refresh operation is initiated in the RAS down state
- self-refreshing is performed
- the chip enters software standby mode
- the external bus is released
- the RCDM bit or BE bit is cleared to 0

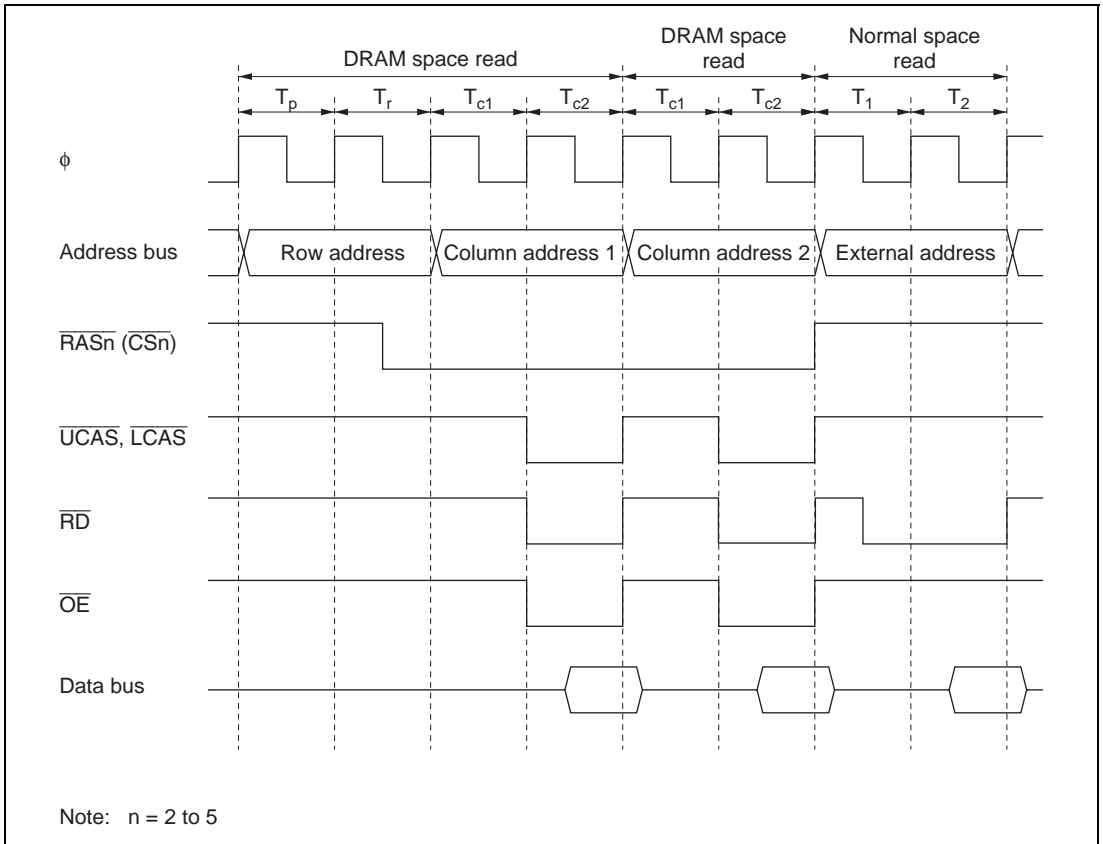

If a transition is made to the all-module-clocks-stopped mode in the  $\overline{\text{RAS}}$  down state, the clock will stop with  $\overline{\text{RAS}}$  low. To enter the all-module-clocks-stopped mode with  $\overline{\text{RAS}}$  high, the RCDM bit must be cleared to 0 before executing the SLEEP instruction.

**Figure 6.44 Example of Operation Timing in RAS Down Mode**  
( $\text{RAST} = 0$ ,  $\text{CAST} = 0$ )

- RAS Up Mode

To select RAS up mode, clear the RCDM bit to 0 in DRAMCR. Each time access to DRAM space is interrupted and another space is accessed, the  $\overline{\text{RAS}}$  signal goes high again. Burst operation is only performed if DRAM space is continuous. Figure 6.45 shows an example of the timing in RAS up mode.

**Figure 6.45 Example of Operation Timing in RAS Up Mode  
( $\text{RAST} = 0$ ,  $\text{CAST} = 0$ )**

## 6.7.12 Refresh Control

This LSI is provided with a DRAM refresh control function. CAS-before-RAS (CBR) refreshing is used. In addition, self-refreshing can be executed when the chip enters the software standby state.

Refresh control is enabled when any area is designated as DRAM space in accordance with the setting of bits RMTS2 to RMTS0 in DRAMCR.

### (1) CAS-before-RAS (CBR) Refreshing

To select CBR refreshing, set the RFSHE bit to 1 in REFCR.

With CBR refreshing, RTCNT counts up using the input clock selected by bits RTCK2 to RTCK0 in REFCR, and when the count matches the value set in RTCOR (compare match), refresh control is performed. At the same time, RTCNT is reset and starts counting up again from H'00. Refreshing is thus repeated at fixed intervals determined by RTCOR and bits RTCK2 to RTCK0. Set a value in RTCOR and bits RTCK2 to RTCK0 that will meet the refreshing interval specification for the DRAM used.

When bits RTCK2 to RTCK0 in REFCR are set, RTCNT starts counting up. RTCNT and RTCOR settings should therefore be completed before setting bits RTCK2 to RTCK0. RTCNT operation is shown in figure 6.46, compare match timing in figure 6.47, and CBR refresh timing in figure 6.48.

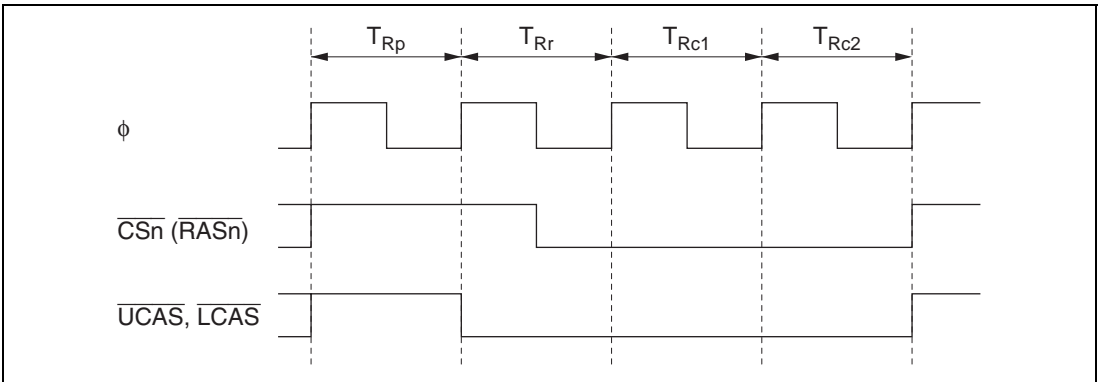

When the CBRM bit in REFCR is cleared to 0, access to external space other than DRAM space is performed in parallel during the CBR refresh period.

**Figure 6.46 RTCNT Operation**

**Figure 6.47 Compare Match Timing**

**Figure 6.48 CBR Refresh Timing**

A setting can be made in bits RCW1 and RCW0 in REFCR to delay  $\overline{\text{RAS}}$  signal output by one to three cycles. Use bits RLW1 and RLW0 in REFCR to adjust the width of the  $\overline{\text{RAS}}$  signal. The settings of bits RCW1, RCW0, RLW1, and RLW0 are valid only in refresh operations.

Figure 6.49 shows the timing when bits RCW1 and RCW0 are set.

**Figure 6.49 CBR Refresh Timing**  
(RCW1 = 0, RCW0 = 1, RLW1 = 0, RLW0 = 0)

Depending on the DRAM used, modification of the  $\overline{\text{WE}}$  signal may not be permitted during the refresh period. In this case, the CBRM bit in REFCR should be set to 1. The bus controller will then insert refresh cycles in appropriate breaks between bus cycles. Figure 6.50 shows an example of the timing when the CBRM bit is set to 1. In this case the  $\overline{\text{CS}}$  signal is not controlled, and retains its value prior to the start of the refresh period.

**Figure 6.50 Example of CBR Refresh Timing (CBRM = 1)**

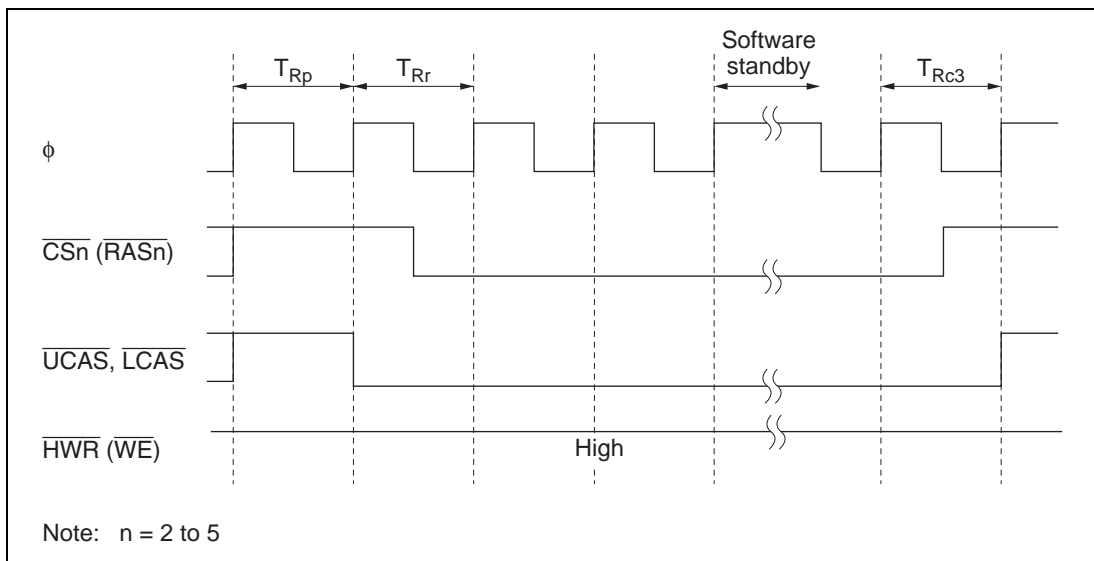

## (2) Self-Refreshing

A self-refresh mode (battery backup mode) is provided for DRAM as a kind of standby mode. In this mode, refresh timing and refresh addresses are generated within the DRAM.

To select self-refreshing, set the RFSHE bit and SLFRF bit to 1 in REFCR. When a SLEEP instruction is executed to enter software standby mode, the  $\overline{\text{CAS}}$  and  $\overline{\text{RAS}}$  signals are output and DRAM enters self-refresh mode, as shown in figure 6.51.

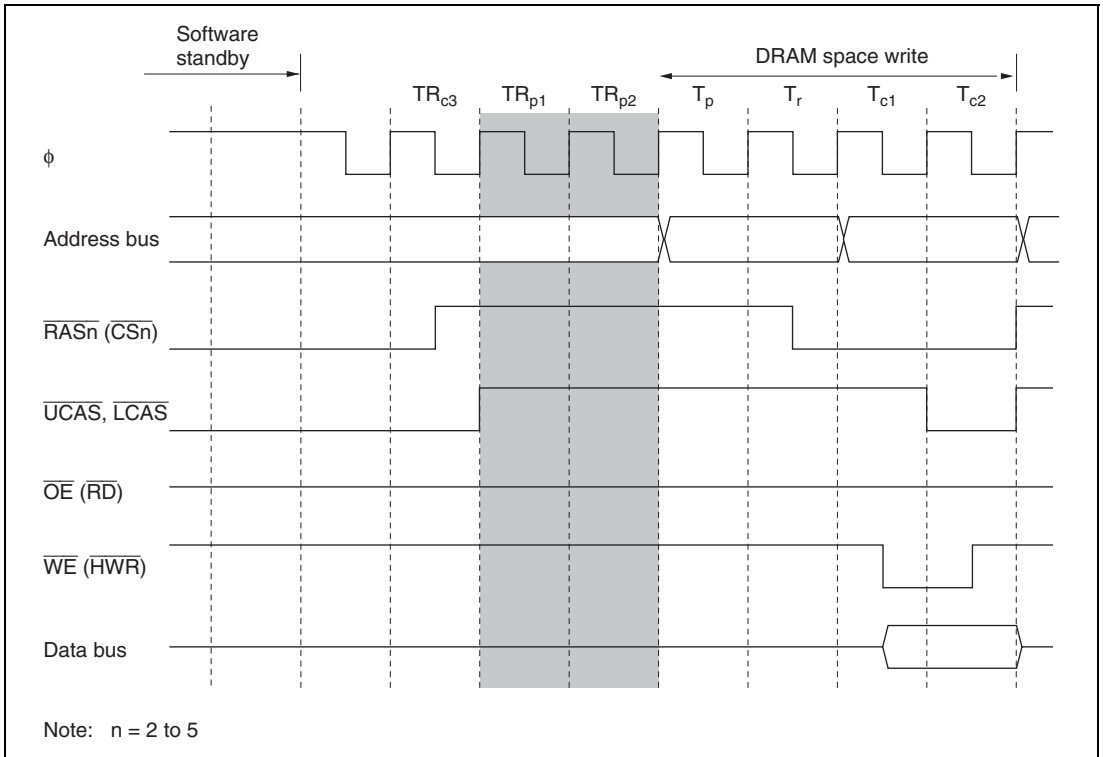

When software standby mode is exited, the SLFRF bit is cleared to 0 and self-refresh mode is exited automatically. If a CBR refresh request occurs when making a transition to software standby mode, CBR refreshing is executed, and then self-refresh mode is entered.

When using self-refresh mode, the OPE bit must not be cleared to 0 in the SBYCR register.

**Figure 6.51 Self-Refresh Timing**

In some DRAMs provided with a self-refresh mode, the  $\overline{\text{RAS}}$  signal precharge time immediately after self-refreshing is longer than the normal precharge time. A setting can be made in bits TPCS2 to TPCS0 in REFCR to make the precharge time immediately after self-refreshing from 1 to 7 states longer than the normal precharge time. In this case, too, normal precharging is performed according to the setting of bits TPC1 and TPC0 in DRACCR, and therefore a setting should be made to give the optimum post-self-refresh precharge time, including this time. Figure 6.52 shows an example of the timing when the precharge time immediately after self-refreshing is extended by 2 states.

**Figure 6.52 Example of Timing when Precharge Time after Self-Refreshing Is Extended by 2 States**

### (3) Refreshing and All-Module-Clocks-Stopped Mode

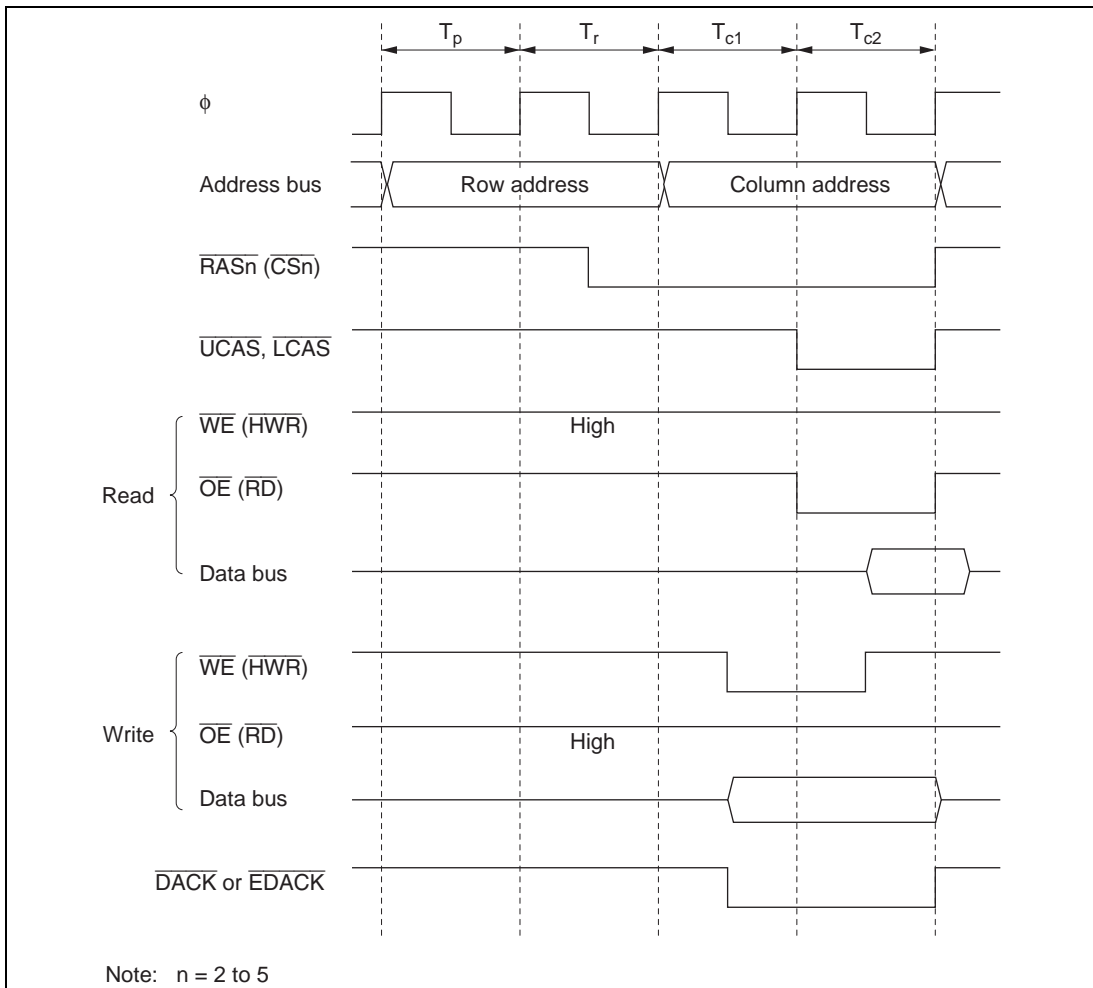

In this LSI, if the ACSE bit is set to 1 in MSTPCRH, and then a SLEEP instruction is executed with the setting for all peripheral module clocks to be stopped (MSTPCR = H'FFFF, EXMSTPCR = H'FFFF) or for operation of the 8-bit timer module alone (MSTPCR = H'FFFE, EXMSTPCR = H'FFFF), and a transition is made to the sleep state, the all-module-clocks-stopped mode is entered, in which the bus controller and I/O port clocks are also stopped. As the bus controller clock is also stopped in this mode, CBR refreshing is not executed. If DRAM is connected externally and DRAM data is to be retained in sleep mode, the ACSE bit must be cleared to 0 in MSTPCRH.

#### 6.7.13 DMAC and EXDMAC Single Address Transfer Mode and DRAM Interface

When burst mode is selected on the DRAM interface, the  $\overline{\text{DACK}}$  and  $\overline{\text{EDACK}}$  output timing can be selected with the DDS and EDDS bits in DRAMCR. When DRAM space is accessed in DMAC or EXDMAC single address mode at the same time, these bits select whether or not burst access is to be performed.

##### (1) When DDS = 1 or EDDS = 1

Burst access is performed by determining the address only, irrespective of the bus master. With the DRAM interface, the  $\overline{\text{DACK}}$  or  $\overline{\text{EDACK}}$  output goes low from the  $T_{cl}$  state. Figure 6.53 shows the  $\overline{\text{DACK}}$  or  $\overline{\text{EDACK}}$  output timing for the DRAM interface when DDS = 1 or EDDS = 1.

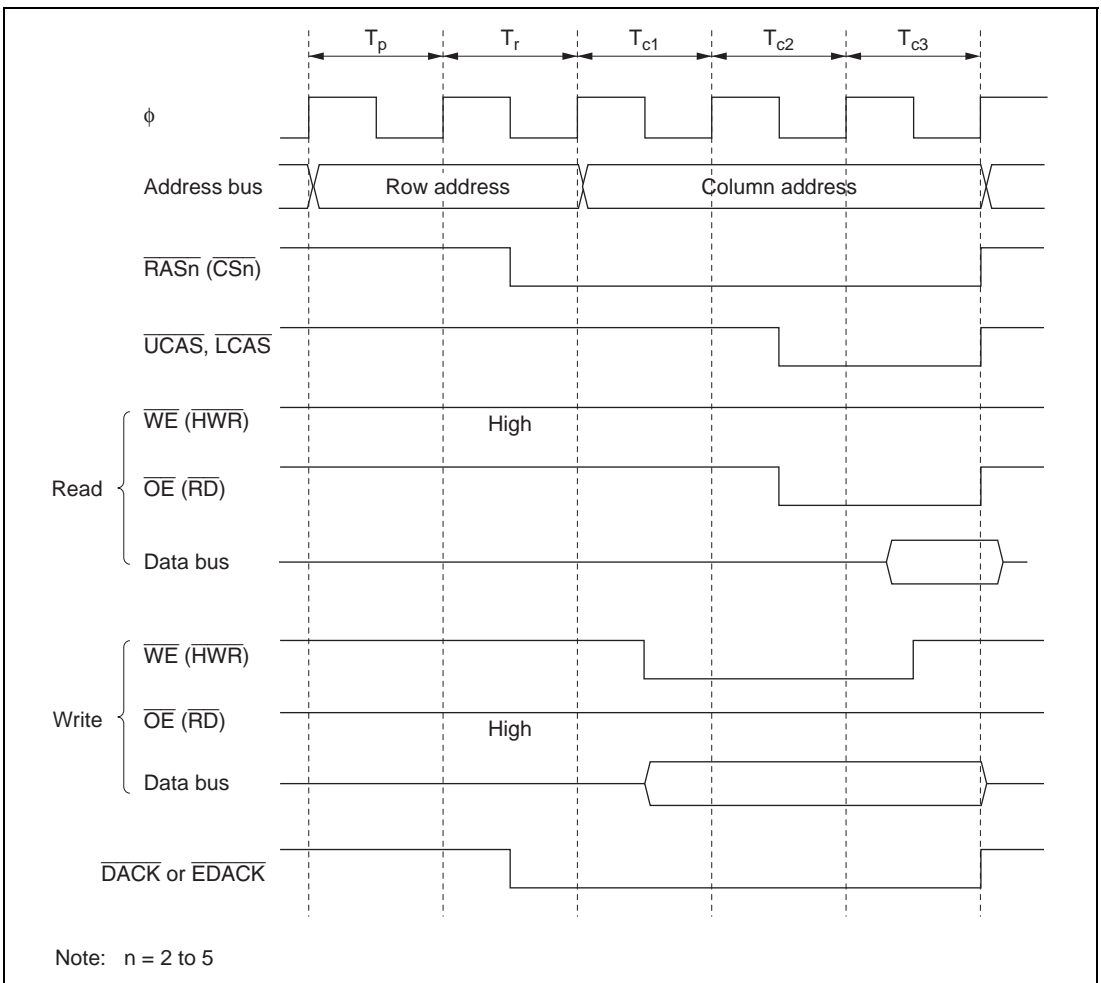

**Figure 6.53 Example of  $\overline{\text{DACK}}/\overline{\text{EDACK}}$  Output Timing when  $\text{DDS} = 1$  or  $\text{EDDS} = 1$  ( $\text{RAST} = 0$ ,  $\text{CAST} = 0$ )**

**(2) When DDS = 0 or EDDS = 0**

When DRAM space is accessed in DMAC or EXDMAC single address transfer mode, full access (normal access) is always performed. With the DRAM interface, the  $\overline{\text{DACK}}$  or  $\overline{\text{EDACK}}$  output goes low from the  $T_r$  state.

In modes other than DMAC or EXDMAC single address transfer mode, burst access can be used when accessing DRAM space.

Figure 6.54 shows the  $\overline{\text{DACK}}$  or  $\overline{\text{EDACK}}$  output timing for the DRAM interface when DDS = 0 or EDDS = 0.

**Figure 6.54 Example of  $\overline{\text{DACK}}$ / $\overline{\text{EDACK}}$  Output Timing when DDS = 0 or EDDS = 0 (RAST = 0, CAST = 1)**

## 6.8 Synchronous DRAM Interface

In the H8S/2426R Group, external address space areas 2 to 5 can be designated as continuous synchronous DRAM space, and synchronous DRAM interfacing performed. The synchronous DRAM interface allows synchronous DRAM to be directly connected to this LSI. A synchronous DRAM space of up to 8 Mbytes can be set by means of bits RMTS2 to RMTS0 in DRAMCR. Synchronous DRAM of CAS latency 1 to 4 can be connected.

Note: The synchronous DRAM interface is not supported by the H8S/2426 Group and H8S/2424 Group.

### 6.8.1 Setting Continuous Synchronous DRAM Space

Areas 2 to 5 are designated as continuous synchronous DRAM space by setting bits RMTS2 to RMTS0 in DRAMCR. The relation between the settings of bits RMTS2 to RMTS0 and synchronous DRAM space is shown in table 6.8. Possible synchronous DRAM interface settings are and continuous area (areas 2 to 5).

**Table 6.8 Relation between Settings of Bits RMTS2 to RMTS0 and Synchronous DRAM Space**

| RMTS2 | RMTS1 | RMTS0      | Area 5                            | Area 4       | Area 3       | Area 2     |
|-------|-------|------------|-----------------------------------|--------------|--------------|------------|
| 0     | 0     | 1          | Normal space                      | Normal space | Normal space | DRAM space |
|       |       | 0          | Normal space                      | Normal space | DRAM space   | DRAM space |
|       | 1     | DRAM space | DRAM space                        | DRAM space   | DRAM space   |            |
| 1     | 0     | 0          | Continuous synchronous DRAM space |              |              |            |
|       |       | 1          | Mode settings of synchronous DRAM |              |              |            |
|       | 1     | 0          | Reserved (setting prohibited)     |              |              |            |
|       |       | 1          | Continuous DRAM space             |              |              |            |

With continuous synchronous DRAM space,  $\overline{CS2}$ ,  $\overline{CS3}$ ,  $\overline{CS4}$  pins are used as  $\overline{RAS}$ ,  $\overline{CAS}$ ,  $\overline{WE}$  signal. The  $\overline{OE}$  pin of the DRAM is used as the CKE signal, and the  $\overline{CS5}$  pin is used as synchronous DRAM clock (SDRAM $\phi$ ). The bus specifications for continuous synchronous DRAM space conform to the settings for area 2. The pin wait and program wait for the continuous synchronous DRAM are invalid.

Commands for the synchronous DRAM can be specified by combining  $\overline{RAS}$ ,  $\overline{CAS}$ ,  $\overline{WE}$ , and address-precharge-setting command (Precharge-sel) output on the upper column addresses.

Commands that are supported by this LSI are NOP, auto-refresh (REF), self-refresh (SELF), all bank precharge (PALL), row address strobe bank-active (ACTV), read (READ), write (WRIT), and mode-register write (MRS). Commands for bank control cannot be used.

## 6.8.2 Address Multiplexing

With continuous synchronous DRAM space, the row address and column address are multiplexed. In address multiplexing, the size of the shift of the row address is selected with bits MXC2 to MXC0 in DRAMCR. The address-precharge-setting command (Precharge-sel) can be output on the upper column address. Table 6.9 shows the relation between the settings of MXC2 to MXC0 and the shift size. The MXC2 bit should be set to 1 when the synchronous DRAM interface is used.

**Table 6.9 Relation between Settings of Bits MXC2 to MXC0 and Address Multiplexing**

|                | DRAMCR |      |         | Shift Size                    | Address Pins |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |    |
|----------------|--------|------|---------|-------------------------------|--------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|----|
|                | MXC2   | MXC1 | MXC0    |                               | A23 to A16   | A15 | A14 | A13 | A12 | A11 | A10 | A9  | A8  | A7  | A6  | A5  | A4  | A3  | A2  | A1  | A0  |    |
| Row address    | 0      | x    | x       | Reserved (setting prohibited) |              |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |    |
|                | 1      | 0    | 0       | 8 bits                        | A23 to A16   | A23 | A22 | A21 | A20 | A19 | A18 | A17 | A16 | A15 | A14 | A13 | A12 | A11 | A10 | A9  | A8  |    |
|                |        |      | 1       | 9 bits                        | A23 to A16   | A15 | A23 | A22 | A21 | A20 | A19 | A18 | A17 | A16 | A15 | A14 | A13 | A12 | A11 | A10 | A9  |    |
|                | 1      | 1    | 0       | 10 bits                       | A23 to A16   | A15 | A14 | A23 | A22 | A21 | A20 | A19 | A18 | A17 | A16 | A15 | A14 | A13 | A12 | A11 | A10 |    |
| 1              |        |      | 11 bits | A23 to A16                    | A15          | A14 | A13 | A23 | A22 | A21 | A20 | A19 | A18 | A17 | A16 | A15 | A14 | A13 | A12 | A11 |     |    |
| Column address | 0      | x    | x       | Reserved (setting prohibited) |              |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |    |
|                | 1      | 0    | 0       | —                             | A23 to A16   | P   | P   | P   | P   | P   | P   | P   | P   | A8  | A7  | A6  | A5  | A4  | A3  | A2  | A1  | A0 |
|                |        |      | 1       | —                             | A23 to A16   | P   | P   | P   | P   | P   | P   | A9  | A8  | A7  | A6  | A5  | A4  | A3  | A2  | A1  | A0  |    |
|                | 1      | 1    | 0       | —                             | A23 to A16   | P   | P   | P   | P   | P   | A10 | A9  | A8  | A7  | A6  | A5  | A4  | A3  | A2  | A1  | A0  |    |
| 1              |        |      | —       | A23 to A16                    | P            | P   | P   | P   | A11 | A10 | A9  | A8  | A7  | A6  | A5  | A4  | A3  | A2  | A1  | A0  |     |    |

[Legend]

x: Don't care.

P: Precharge-sel

### 6.8.3 Data Bus

If the ABW2 bit in ABWCR corresponding to an area designated as continuous synchronous DRAM space is set to 1, areas 2 to 5 are designated as 8-bit continuous synchronous DRAM space; if the bit is cleared to 0, the areas are designated as 16-bit continuous synchronous DRAM space. In 16-bit continuous synchronous DRAM space,  $\times 16$ -bit configuration synchronous DRAM can be connected directly.

In 8-bit continuous synchronous DRAM space the upper half of the data bus, D15 to D8, is enabled, while in 16-bit continuous synchronous DRAM space both the upper and lower halves of the data bus, D15 to D0, are enabled.

Access sizes and data alignment are the same as for the basic bus interface: see section 6.5.1, Data Size and Data Alignment.

### 6.8.4 Pins Used for Synchronous DRAM Interface

Table 6.10 shows pins used for the synchronous DRAM interface and their functions.

Set the OEE bit in DRAMCR to 1 when the CKE signal is output.

**Table 6.10 Synchronous DRAM Interface Pins**

| Pin                 | With Synchronous DRAM Setting | Name                   | I/O    | Function   |
|---------------------|-------------------------------|------------------------|--------|--|
| $\overline{CS2}$    | $\overline{RAS}$              | Row address strobe     | Output | Row address strobe when areas 2 to 5 are designated as continuous synchronous DRAM space   |
| $\overline{CS3}$    | $\overline{CAS}$              | Column address strobe  | Output | Column address strobe when areas 2 to 5 are designated as continuous synchronous DRAM space  |
| $\overline{CS4}$    | $\overline{WE}$               | Write enable           | Output | Write enable strobe when areas 2 to 5 are designated as continuous synchronous DRAM space  |
| $\overline{CS5}$    | SDRAM $\phi$                  | Clock                  | Output | Clock only for synchronous DRAM  |
| ( $\overline{OE}$ ) | (CKE)                         | Clock enable           | Output | Clock enable signal when areas 2 to 5 are designated as continuous synchronous DRAM space  |
| $\overline{UCAS}$   | DQMU                          | Upper data mask enable | Output | Upper data mask enable for 16-bit continuous synchronous DRAM space access/data mask enable for 8-bit continuous synchronous DRAM space access |
| $\overline{LCAS}$   | DQML                          | Lower data mask enable | Output | Lower data mask enable signal for 16-bit continuous synchronous DRAM space access  |
| A15 to A0           | A15 to A0                     | Address pins           | Output | Row address/column address multiplexed output pins   |
| D15 to D0           | D15 to D0                     | Data pins              | I/O    | Data input/output pins   |

### 6.8.5 Synchronous DRAM Clock

The synchronous clock (SDRAM $\phi$ ) is output from the  $\overline{CS5}$  pin. SDRAM $\phi$  is shifted by 90° phase from  $\phi$ . Therefore, a stable margin is ensured for the synchronous DRAM that operates at the rising edge of clocks. Figure 6.55 shows the relationship between  $\phi$  and SDRAM $\phi$ .

**Figure 6.55 Relationship between  $\phi$  and SDRAM $\phi$**

### 6.8.6 Basic Timing

The four states of the basic timing consist of one  $T_p$  (precharge cycle) state, one  $T_r$  (row address output cycle) state, and the  $T_{c1}$  and two  $T_{c2}$  (column address output cycle) states.

When areas 2 to 5 are set for the continuous synchronous DRAM space, settings of the WAITE bit of BCR, RAST, CAST, RCDM bits of DRAMCR, and the CBRM bit of REFCR are ignored.

Figure 6.56 shows the basic timing for synchronous DRAM.

Figure 6.56 Basic Access Timing of Synchronous DRAM (CAS Latency 1)

### 6.8.7 CAS Latency Control

CAS latency is controlled by settings of the W22 to W20 bits of WTCRB. Set the CAS latency count, as shown in table 6.11, by the setting of synchronous DRAM. Depending on the setting, the CAS latency control cycle ( $T_{cl}$ ) is inserted. WTCRB can be set regardless of the setting of the AST2 bit of ASTCR. Figure 6.57 shows the CAS latency control timing when synchronous DRAM of CAS latency 3 is connected.

The initial value of W22 to W20 is H'7. Set the register according to the CAS latency of synchronous DRAM to be connected.

**Table 6.11 Setting CAS Latency**

| W22 | W21 | W20 | Description                               | CAS Latency Control Cycle Inserted |
|-----|-----|-----|---|------------------------------------|
| 0   | 0   | 0   | Connect synchronous DRAM of CAS latency 1 | 0 state                            |
|     |     | 1   | Connect synchronous DRAM of CAS latency 2 | 1 state                            |
|     | 1   | 0   | Connect synchronous DRAM of CAS latency 3 | 2 states                           |
|     |     | 1   | Connect synchronous DRAM of CAS latency 4 | 3 states                           |
| 1   | 0   | 0   | Reserved (must not be used)               | —                                  |
|     |     | 1   | Reserved (must not be used)               | —                                  |
|     | 1   | 0   | Reserved (must not be used)               | —                                  |
|     |     | 1   | Reserved (must not be used)               | —                                  |

Figure 6.57 CAS Latency Control Timing (SDWCD = 0, CAS Latency 3)

### 6.8.8 Row Address Output State Control

When the command interval specification from the ACTV command to the next READ/WRITE command cannot be satisfied, 1 to 3 states ( $T_{rw}$ ) that output the NOP command can be inserted between the  $T_r$  cycle that outputs the ACTV command and the  $T_{c1}$  cycle that outputs the column address by setting the RCD1 and RCD0 bits of DRACCR. Use the optimum setting for the wait time according to the synchronous DRAM connected and the operating frequency of this LSI. Figure 6.58 shows an example of the timing when the one  $T_{rw}$  state is set.

**Figure 6.58 Example of Access Timing when Row Address Output Hold State Is 1 State (RCD1 = 0, RCD0 = 1, SDWCD = 0, CAS Latency 2)**

### 6.8.9 Precharge State Count

When the interval specification from the PALL command to the next ACTV/REF command cannot be satisfied, from one to four  $T_p$  states can be selected by setting bits TPC1 and TPC0 in DRACCR. Set the optimum number of  $T_p$  cycles according to the synchronous DRAM connected and the operating frequency of this LSI. Figure 6.59 shows the timing when two  $T_p$  states are inserted.

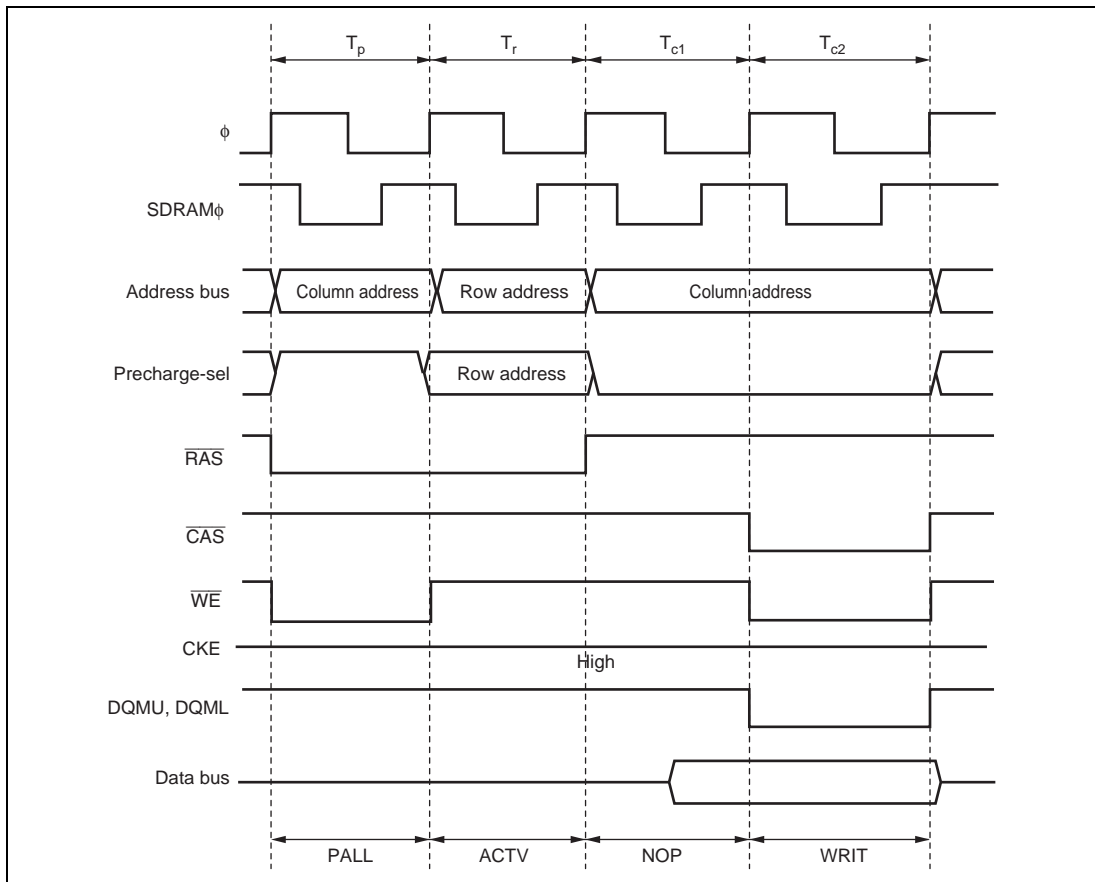

The setting of bits TPC1 and TPC0 is also valid for  $T_p$  states in refresh cycles.

**Figure 6.59 Example of Timing with Two-State Precharge Cycle (TPC1 = 0, TPC0 = 1, SDWCD = 0, CAS Latency 2)**

### 6.8.10 Bus Cycle Control in Write Cycle

By setting the SDWCD bit of the DRACCR to 1, the CAS latency control cycle ( $T_{c1}$ ) that is inserted by the WTCRB register in the write access of the synchronous DRAM can be disabled. Disabling the CAS latency control cycle can reduce the write-access cycle count as compared to synchronous DRAM read access. Figure 6.60 shows the write access timing when the CAS latency control cycle is disabled.

**Figure 6.60 Example of Write Access Timing when CAS Latency Control Cycle Is Disabled (SDWCD = 1)**

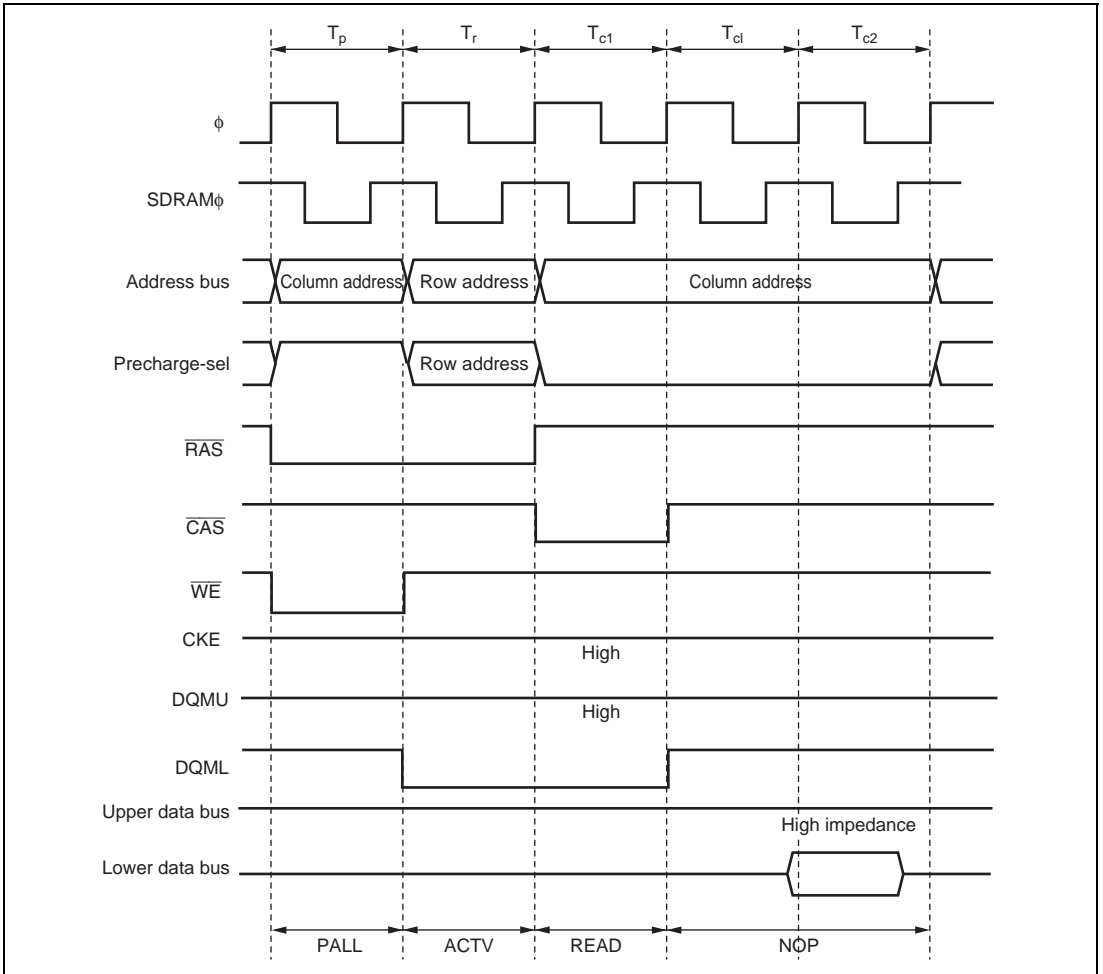

### 6.8.11 Byte Access Control

When synchronous DRAM with a  $\times 16$ -bit configuration is connected, DQMU and DQML are used for the control signals needed for byte access.

Figures 6.61 and 6.62 show the control timing for DQM, and figure 6.63 shows an example of connection of byte control by DQMU and DQML.

**Figure 6.61 DQMU and DQML Control Timing**  
(Upper Byte Write Access: SDWCD = 0, CAS Latency 2)

**Figure 6.62 DQMU and DQML Control Timing  
(Lower Byte Read Access: CAS Latency 2)**

- Notes:
1. Bank control is not available.
  2. The CKE and  $\overline{CS}$  pins must be fixed to 1 when the power supply is input.
  3. The  $\overline{CS}$  pin must be fixed to 0 before accessing synchronous DRAM.

**Figure 6.63 Example of DQMU and DQML Byte Control**

## 6.8.12 Burst Operation

With synchronous DRAM, in addition to full access (normal access) in which data is accessed by outputting a row address for each access, burst access is also provided which can be used when making consecutive accesses to the same row address. This access enables fast access of data by simply changing the column address after the row address has been output. Burst access can be selected by setting the BE bit to 1 in DRAMCR.

DQM has the 2-cycle latency when synchronous DRAM is read. Therefore, the DQM signal cannot be specified to the Tc2 cycle data output if the Tc1 cycle is executed for second or following column address when the CAS latency is set to 1 to issue the READ command. Do not set the BE bit to 1 when synchronous DRAM of CAS latency 1 is connected.

### (1) Burst Access Operation Timing

Figure 6.64 shows the operation timing for burst access. When there are consecutive access cycles for continuous synchronous DRAM space, the column address output cycles continue as long as the row address is the same for consecutive access cycles. The row address used for the comparison is set with bits MXC2 to MXC0 in DRAMCR.

**Figure 6.64 Operation Timing of Burst Access  
(BE = 1, SDWCD = 0, CAS Latency 2)**

## (2) RAS Down Mode

Even when burst operation is selected, it may happen that access to continuous synchronous DRAM space is not continuous, but is interrupted by access to another space. In this case, if the row address active state is held during the access to the other space, the read or write command can be issued without ACTV command generation similarly to DRAM RAS down mode.

To select RAS down mode, set the BE bit to 1 in DRAMCR regardless of the RCDM bit settings. The operation corresponding to DRAM RAS up mode is not supported by this LSI.

Figure 6.65 shows an example of the timing in RAS down mode.

Note, however, the next continuous synchronous DRAM space access is a full access if:

- a refresh operation is initiated in the RAS down state
- self-refreshing is performed
- the chip enters software standby mode
- the external bus is released
- the BE bit is cleared to 0
- the mode register of the synchronous DRAM is set

There is synchronous DRAM in which time of the active state of each bank is restricted. If it is not guaranteed that other row address are accessed in a period in which program execution ensures the value (software standby, sleep, etc.), auto refresh or self refresh must be set, and the restrictions of the maximum active state time of each bank must be satisfied. When refresh is not used, programs must be developed so that the bank is not in the active state for more than the specified time.

**Figure 6.65 Example of Operation Timing in RAS Down Mode (BE = 1, CAS Latency 2)**

### 6.8.13 Refresh Control

This LSI is provided with a synchronous DRAM refresh control function. Auto refreshing is used. In addition, self-refreshing can be executed when the chip enters the software standby state.

Refresh control is enabled when any area is designated as continuous synchronous DRAM space in accordance with the setting of bits RMTS2 to RMTS0 in DRAMCR.

#### (1) Auto Refreshing

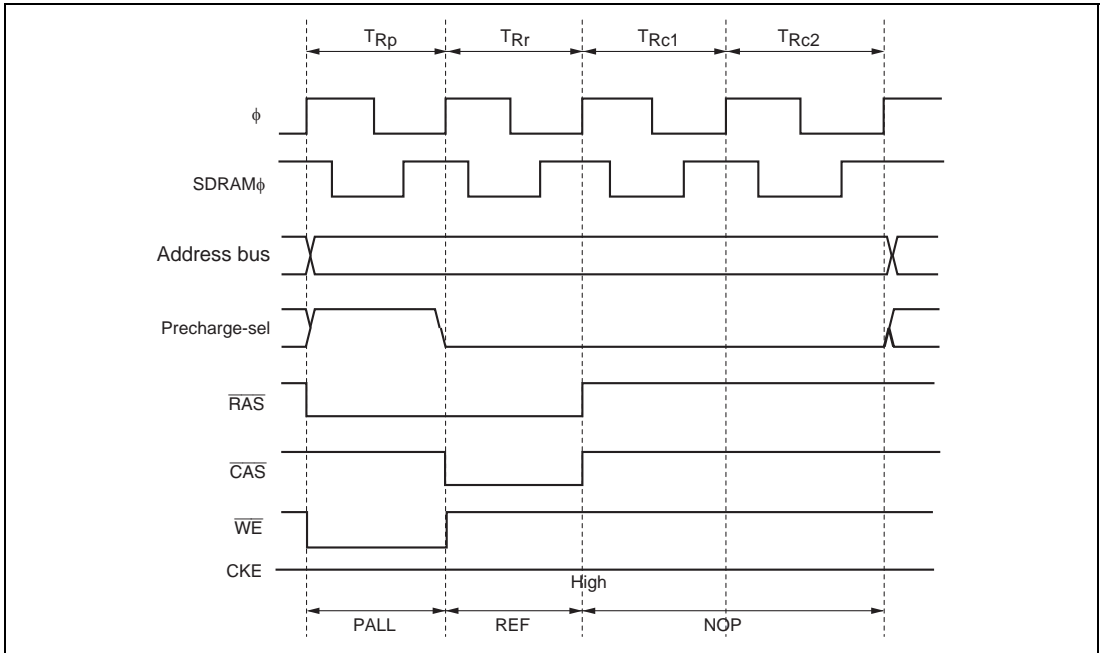

To select auto refreshing, set the RFSHE bit to 1 in REFCR.

With auto refreshing, RTCNT counts up using the input clock selected by bits RTCK2 to RTCK0 in REFCR, and when the count matches the value set in RTCOR (compare match), refresh control is performed. At the same time, RTCNT is reset and starts counting up again from H'00. Refreshing is thus repeated at fixed intervals determined by RTCOR and bits RTCK2 to RTCK0. Set a value in RTCOR and bits RTCK2 to RTCK0 that will meet the refreshing interval specification for the synchronous DRAM used.

When bits RTCK2 to RTCK0 are set, RTCNT starts counting up. RTCNT and RTCOR settings should therefore be completed before setting bits RTCK2 to RTCK0. Auto refresh timing is shown in figure 6.66.

Since the refresh counter operation is the same as the operation in the DRAM interface, see section 6.7.12, Refresh Control.

When the continuous synchronous DRAM space is set, access to external address space other than continuous synchronous DRAM space cannot be performed in parallel during the auto refresh period, since the setting of the CBRM bit of REFCR is ignored.

**Figure 6.66 Auto Refresh Timing**

When the interval specification from the PALL command to the REF command cannot be satisfied, setting the RCW1 and RCW0 bits of REFCR enables one to three wait states to be inserted after the  $T_{Rp}$  cycle that is set by the TPC1 and TPC0 bits of DRACCR. Set the optimum number of waits according to the synchronous DRAM connected and the operating frequency of this LSI. Figure 6.67 shows the timing when one wait state is inserted. Since the setting of bits TPC1 and TPC0 of DRACCR is also valid in refresh cycles, the command interval can be extended by the RCW1 and RCW0 bits after the precharge cycles.

**Figure 6.67 Auto Refresh Timing**  
**(TPC = 1, TPC0 = 1, RCW1 = 0, RCW0 = 1)**

When the interval specification from the REF command to the ACTV cannot be satisfied, setting the RLW1 and RLW0 bits of REFCR enables one to three wait states to be inserted in the refresh cycle. Set the optimum number of waits according to the synchronous DRAM connected and the operating frequency of this LSI. Figure 6.68 shows the timing when one wait state is inserted.

**Figure 6.68 Auto Refresh Timing**  
 (TPC = 0, TPC0 = 0, RLW1 = 0, RLW0 = 1)

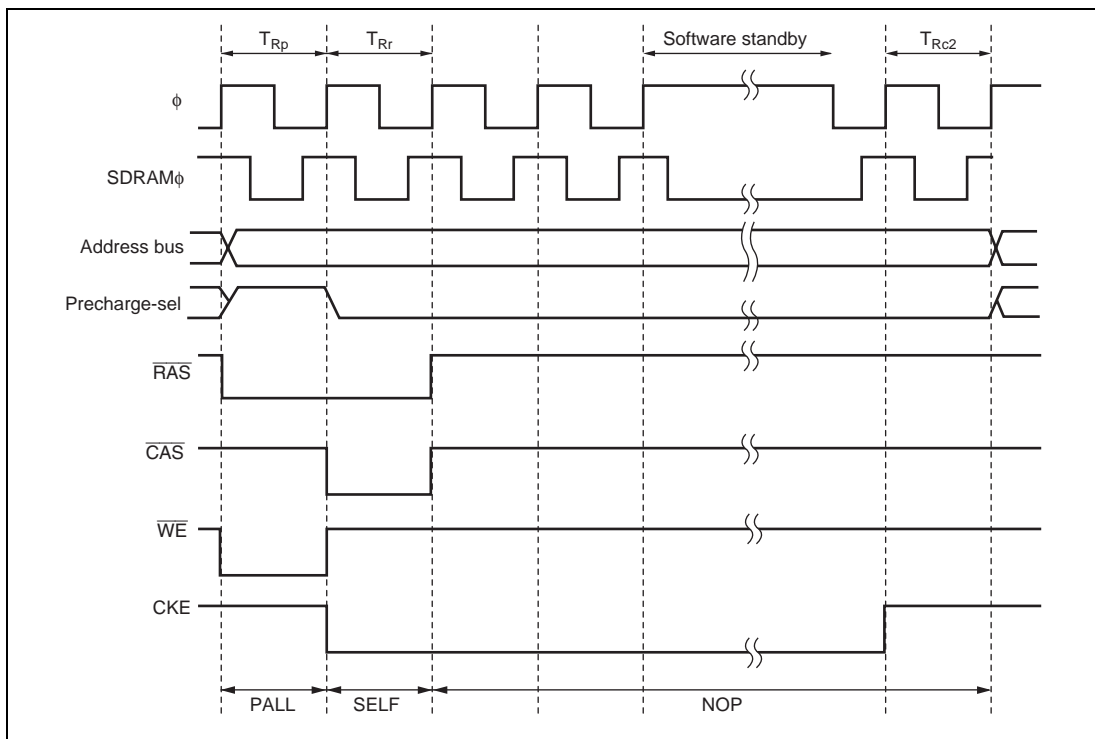

## (2) Self-Refreshing

A self-refresh mode (battery backup mode) is provided for synchronous DRAM as a kind of standby mode. In this mode, refresh timing and refresh addresses are generated within the synchronous DRAM.

To select self-refreshing, set the RFSHE bit to 1 in REFCR. When a SLEEP instruction is executed to enter software standby mode, the SELF command is issued, as shown in figure 6.69.

When software standby mode is exited, the SLFRF bit in REFCR is cleared to 0 and self-refresh mode is exited automatically. If an auto refresh request occurs when making a transition to software standby mode, auto refreshing is executed, and then self-refresh mode is entered.

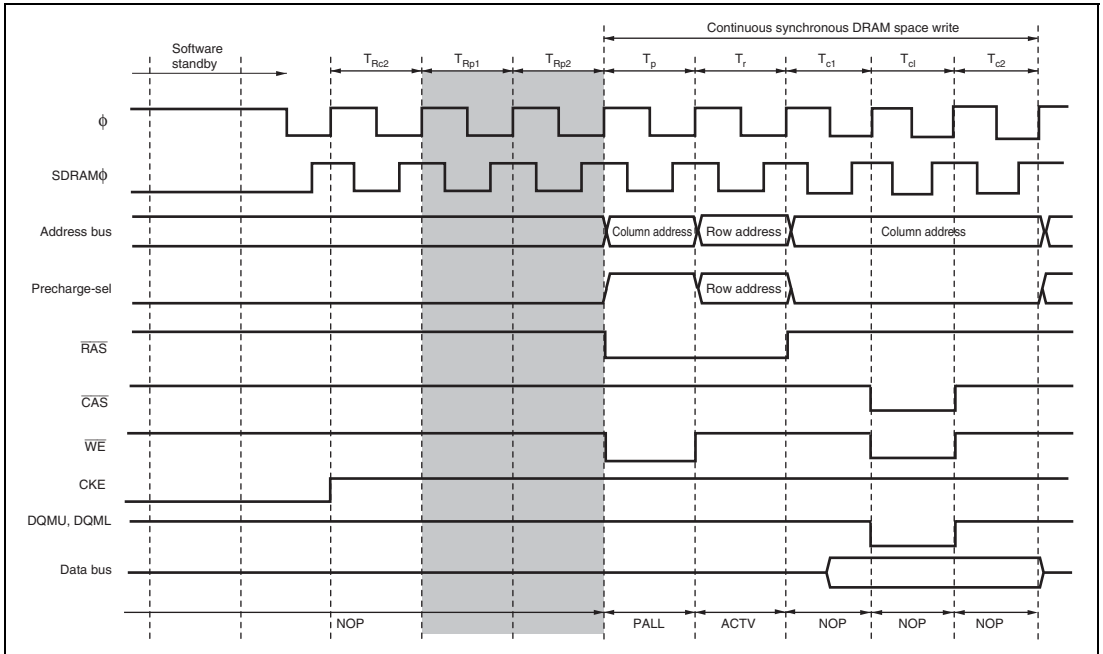

When using self-refresh mode, the OPE bit must not be cleared to 0 in SBYCR.

**Figure 6.69 Self-Refresh Timing**

**(TPC1 = 1, TPC0 = 0, RCW1 = 0, RCW0 = 0, RLW1 = 0, RLW0 = 0)**

In some synchronous DRAMs provided with a self-refresh mode, the interval between clearing self-refreshing and the next command is specified. A setting can be made in bits TPCS2 to TPCS0 in REFCR to make the precharge time after self-refreshing from 1 to 7 states longer than the normal precharge time. In this case, too, normal precharging is performed according to the setting of bits TPC1 and TPC0 in DRACCR, and therefore a setting should be made to give the optimum post-self-refresh precharge time, including this time. Figure 6.70 shows an example of the timing when the precharge time after self-refreshing is extended by 2 states.

**Figure 6.70 Example of Timing when Precharge Time after Self-Refreshing Is Extended by 2 States (TPCS2 to TPCS0 = H'2, TPC1 = 0, TPC0 = 0, CAS Latency 2)**

### (3) Refreshing and All-Module-Clocks-Stopped Mode

In this LSI, if the ACSE bit is set to 1 in MSTPCRH, and then a SLEEP instruction is executed with the setting for all peripheral module clocks to be stopped (MSTPCR = H'FFFF, EXMSTPCR = H'FFFF) or for operation of the 8-bit timer module alone (MSTPCR = H'FFFE, EXMSTPCR = H'FFFF), and a transition is made to the sleep state, the all-module-clocks-stopped mode is entered, in which the bus controller and I/O port clocks are also stopped.

As the bus controller clock is also stopped in this mode, auto refreshing is not executed. If synchronous DRAM is connected to the external address space and DRAM data is to be retained in sleep mode, the ACSE bit must be cleared to 0 in MSTPCR.

### (4) Software Standby

When a transition is made to normal software standby, the PALL command is not output. If synchronous DRAM is connected and DRAM data is to be retained in software standby, self-refreshing must be set.

### 6.8.14 Mode Register Setting of Synchronous DRAM

To use synchronous DRAM, mode must be set after power-on. To set mode, set the RMTS2 to RMTS0 bits in DRAMCR to H'5 and enable the synchronous DRAM mode register setting. After that, access the continuous synchronous DRAM space in bytes. When the value to be set in the synchronous DRAM mode register is X, value X is set in the synchronous DRAM mode register by writing to the continuous synchronous DRAM space of address H'400000 + X for 8-bit bus configuration synchronous DRAM and by writing to the continuous synchronous DRAM space of address H'400000 + 2X for 16-bit bus configuration synchronous DRAM.

The value of the address signal is fetched at the issuance time of the MRS command as the setting value of the mode register in the synchronous DRAM. Mode of burst read/burst write in the synchronous DRAM is not supported by this LSI. For setting the mode register of the synchronous DRAM, set the burst read/single write with the burst length of 1. Figure 6.71 shows the setting timing of the mode in the synchronous DRAM.

**Figure 6.71 Synchronous DRAM Mode Setting Timing**

### 6.8.15 DMAC and EXDMAC Single Address Transfer Mode and Synchronous DRAM Interface

When burst mode is selected on the synchronous DRAM interface, the  $\overline{\text{DACK}}$  and  $\overline{\text{EDACK}}$  output timing can be selected with the DDS and EDDS bits in DRAMCR. When continuous synchronous DRAM space is accessed in DMAC/EXDMAC single address mode at the same time, these bits select whether or not burst access is to be performed. The establishment time for the read data can be extended in the clock suspend mode irrespective of the settings of the DDS and EDDS bits.

#### (1) Output Timing of $\overline{\text{DACK}}$ or $\overline{\text{EDACK}}$

**When DDS = 1 or EDDS = 1:** Burst access is performed by determining the address only, irrespective of the bus master. With the synchronous DRAM interface, the  $\overline{\text{DACK}}$  or  $\overline{\text{EDACK}}$  output goes low from the  $T_{ci}$  state.

Figure 6.72 shows the  $\overline{\text{DACK}}$  or  $\overline{\text{EDACK}}$  output timing for the synchronous DRAM interface when DDS = 1 or EDDS = 1.

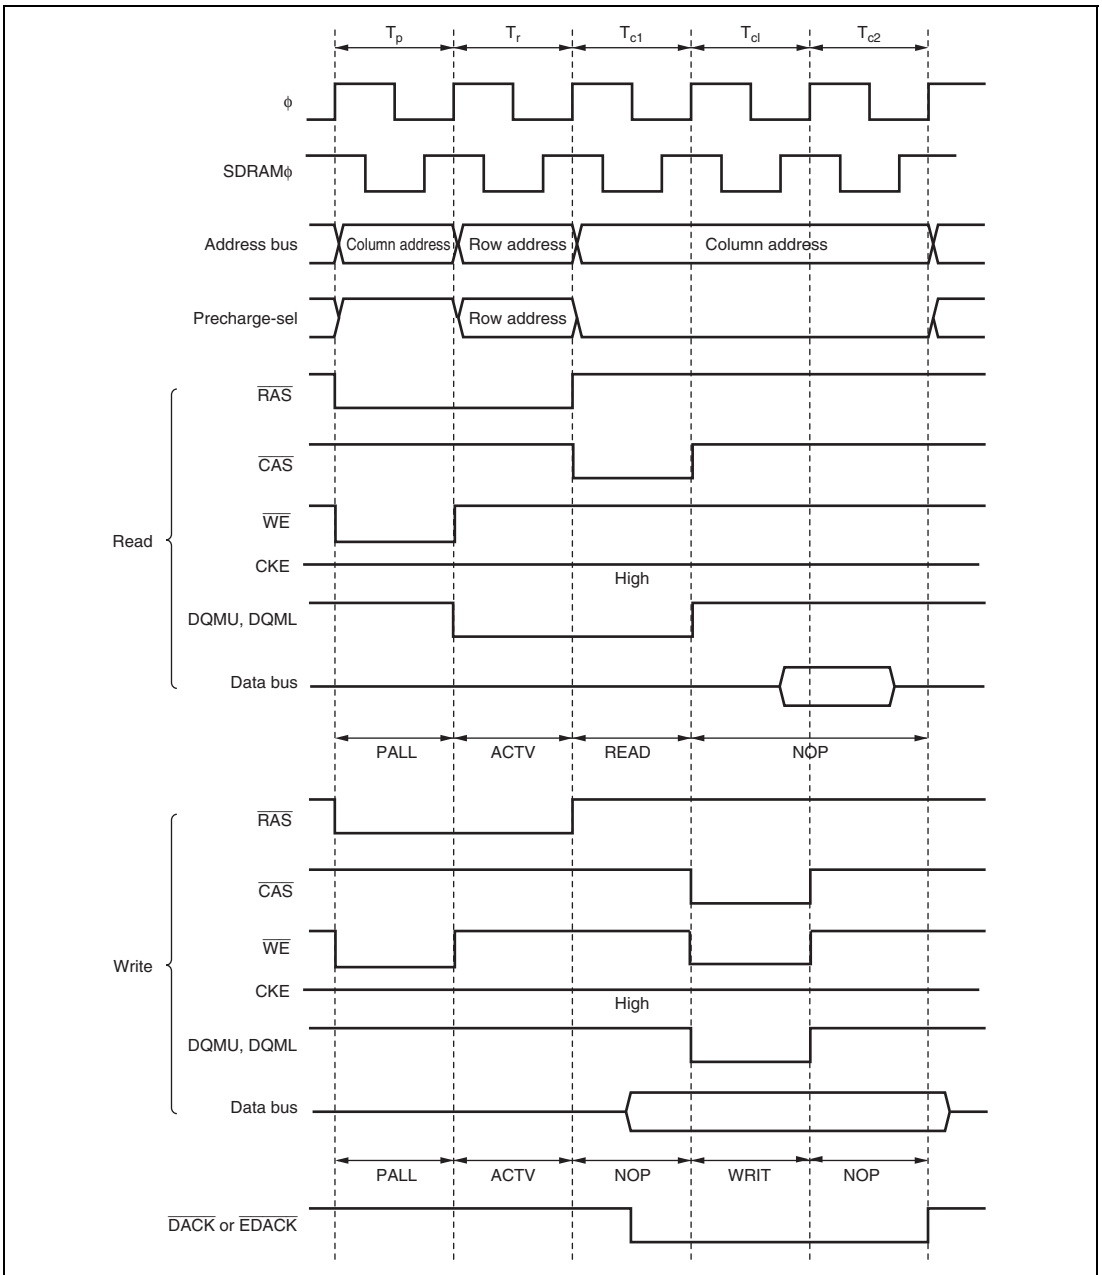

Figure 6.72 Example of  $\overline{DACK}/\overline{EDACK}$  Output Timing when DDS = 1 or EDDS = 1

**When DDS = 0 or EDDS = 0:** When continuous synchronous DRAM space is accessed in DMAC or EXDMAC single address transfer mode, full access (normal access) is always performed. With the synchronous DRAM interface, the  $\overline{\text{DACK}}$  or  $\overline{\text{EDACK}}$  output goes low from the T<sub>r</sub> state.

In modes other than DMAC or EXDMAC single address transfer mode, burst access can be used when accessing continuous synchronous DRAM space.

Figure 6.73 shows the  $\overline{\text{DACK}}$  or  $\overline{\text{EDACK}}$  output timing for connecting the synchronous DRAM interface when DDS = 0 or EDDS = 0.

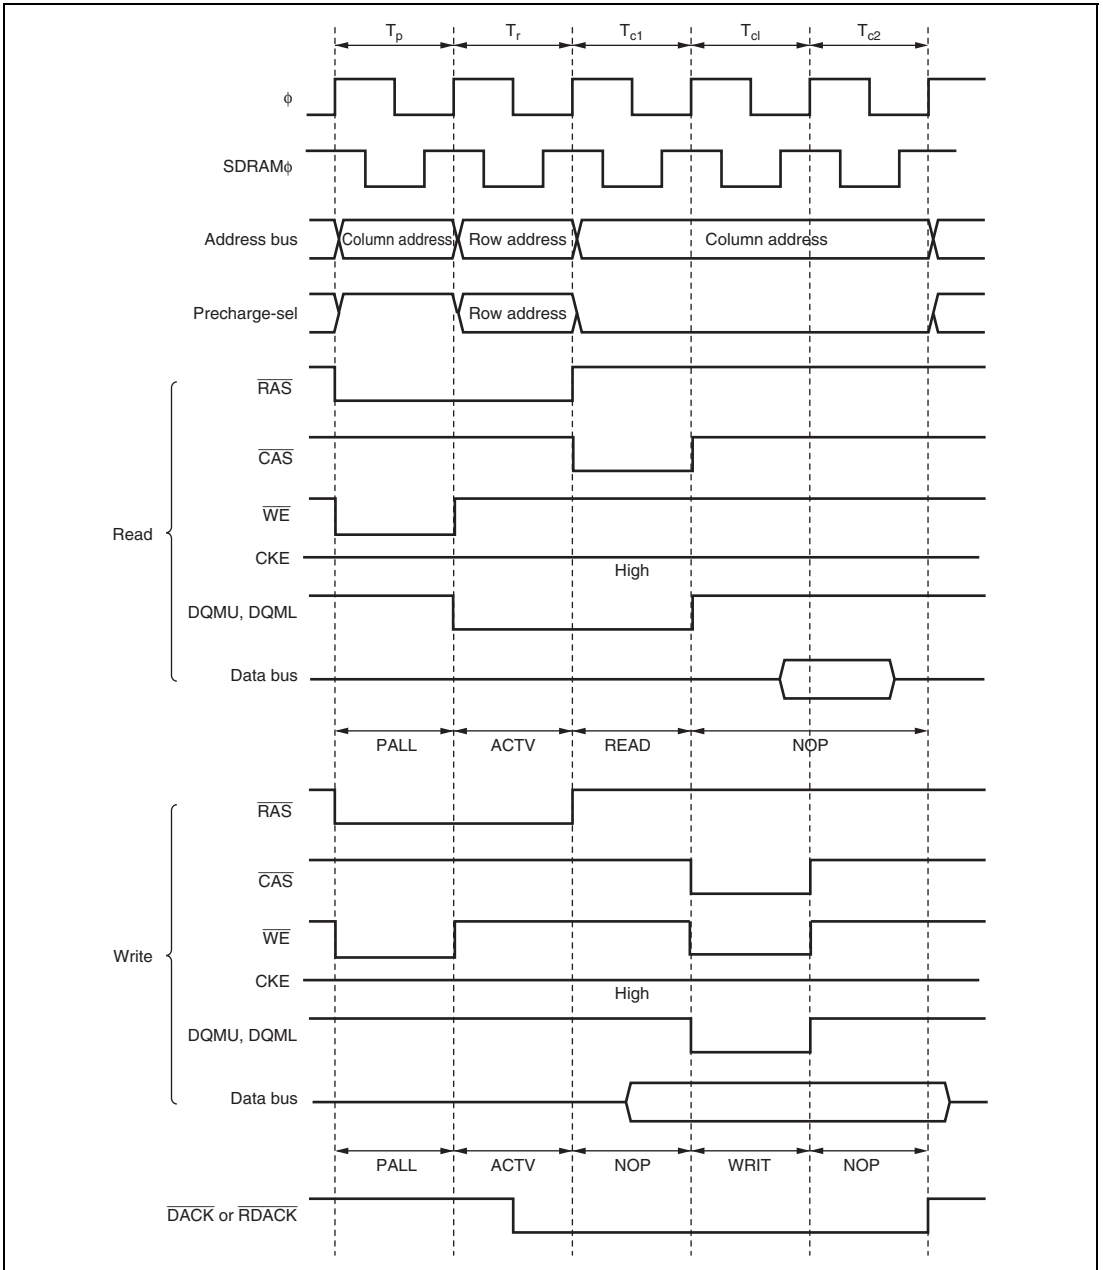

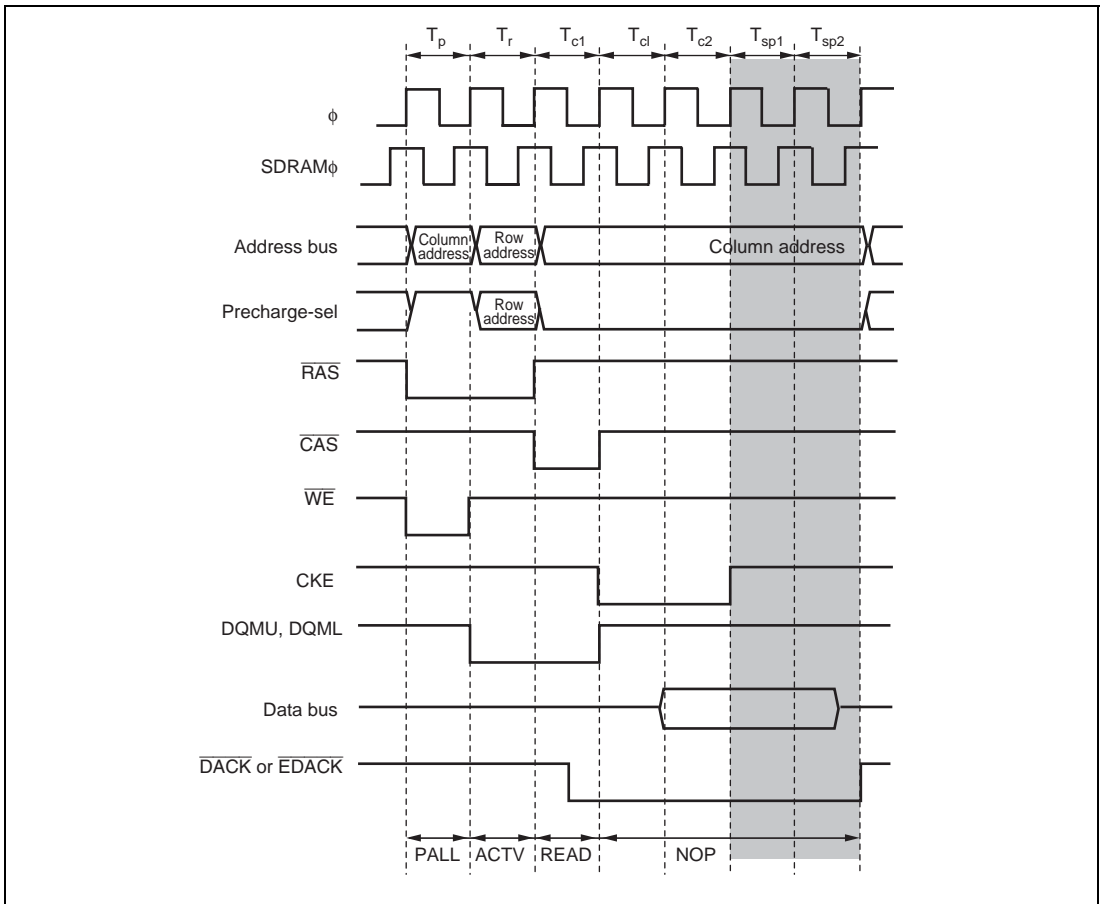

Figure 6.73 Example of  $\overline{\text{DACK}}/\overline{\text{EDACK}}$  Output Timing when DDS = 0 or EDDS = 0

## (2) Read Data Extension

If the CKSPE bit is set to 1 in DRACCR when the continuous synchronous DRAM space is read-accessed in DMAC/EXDMAC single address mode, the establishment time for the read data can be extended by clock suspend mode. The number of states for insertion of the read data extension cycle ( $T_{sp}$ ) is set in bits RDXC1 and RDXC0 in DRACCR. Be sure to set the OEE bit to 1 in DRAMCR when the read data will be extended. The extension of the read data is not in accordance with the bits DDS and EDDS.

Figure 6.74 shows the timing chart when the read data is extended by two cycles.

**Figure 6.74 Example of Timing when the Read Data Is Extended by Two States (DDS = 1, or EDDS = 1, RDXC1 = 0, RDXC0 = 1, CAS Latency 2)**

## 6.9 Burst ROM Interface

In this LSI, external address space areas 0 and 1 can be designated as burst ROM space, and burst ROM interfacing performed. The burst ROM space enables ROM with burst access capability to be accessed at high speed.

Areas 1 and 0 can be designated as burst ROM space by means of bits BSRM1 and BSRM0 in BROMCR. Continuous burst accesses of 4, 8, 16, or 32 words can be performed, according to the setting of the BSWD11 and BSWD10 bits in BROMCR. From 1 to 8 states can be selected for burst access.

Settings can be made independently for area 0 and area 1.

In burst ROM space, burst access covers only CPU read accesses.

### 6.9.1 Basic Timing

The number of access states in the initial cycle (full access) on the burst ROM interface is determined by the basic bus interface settings in ASTCR, ABWCR, WTCRA, WTCRB, and CSACRH. When area 0 or area 1 is designated as burst ROM space, the settings in RDNCR and CSACRL are ignored.

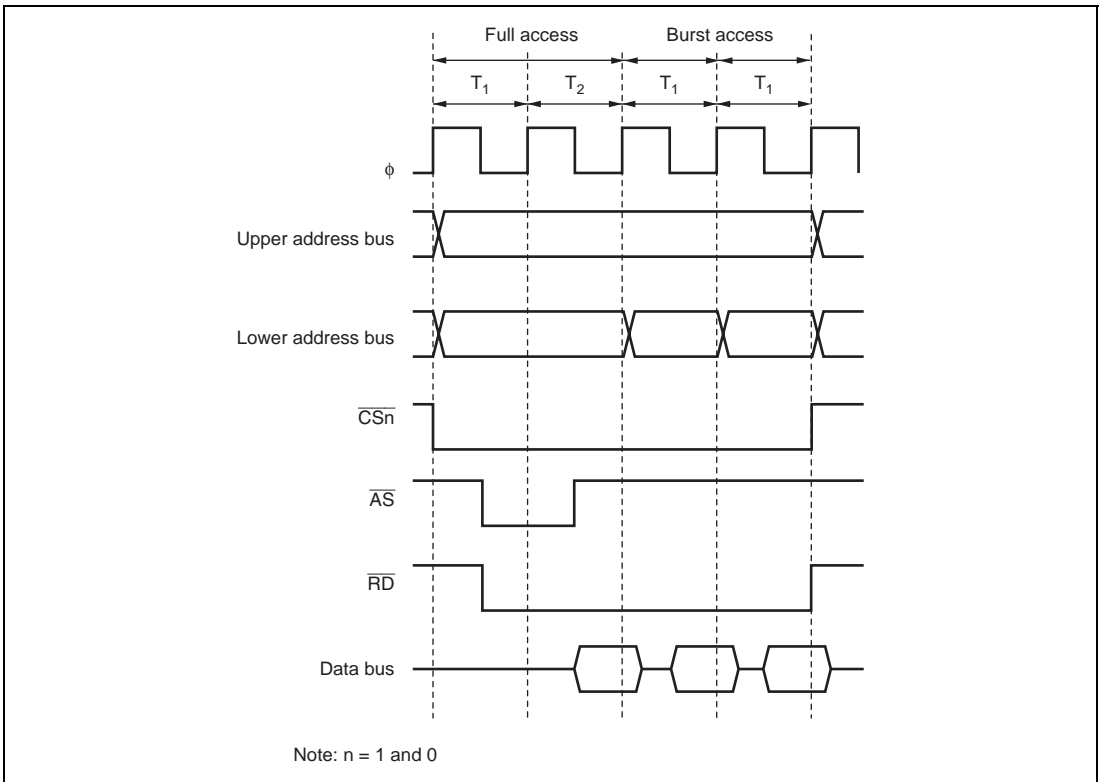

From 1 to 8 states can be selected for the burst cycle, according to the settings of bits BSTS02 to BSTS00 and BSTS12 to BSTS10 in BROMCR. Wait states cannot be inserted. Burst access of up to 32 words is performed, according to the settings of bits BSTS01, BSTS00, BSTS11, and BSTS10 in BROMCR.

The basic access timing for burst ROM space is shown in figures 6.75 and 6.76.

**Figure 6.75 Example of Burst ROM Access Timing**  
 (ASTn = 1, 2-State Burst Cycle)

**Figure 6.76 Example of Burst ROM Access Timing  
( $ASTn = 0$ , 1-State Burst Cycle)**

## 6.9.2 Wait Control

As with the basic bus interface, either program wait insertion or pin wait insertion using the  $\overline{WAIT}$  pin can be used in the initial cycle (full access) on the burst ROM interface. See section 6.5.4, Wait Control. Wait states cannot be inserted in a burst cycle.

## 6.9.3 Write Access

When a write access to burst ROM space is executed, burst access is interrupted at that point and the write access is executed in line with the basic bus interface settings. Write accesses are not performed in burst mode even though burst ROM space is designated.

## 6.10 Idle Cycle

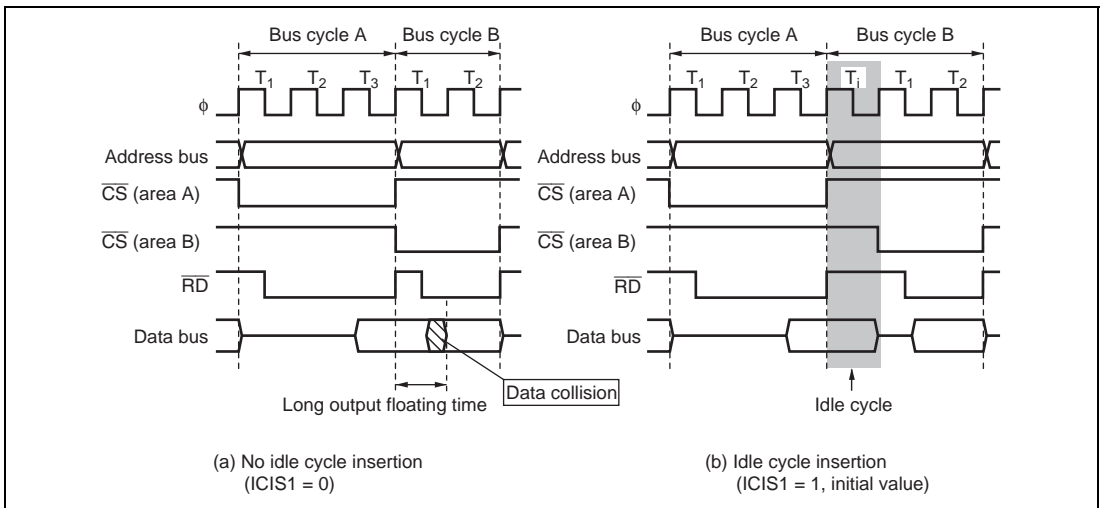

### 6.10.1 Operation

When this LSI accesses external address space, it can insert an idle cycle ( $T_i$ ) between bus cycles in the following three cases: (1) when read accesses in different areas occur consecutively, (2) when a write cycle occurs immediately after a read cycle, and (3) when a read cycle occurs immediately after a write cycle. Insertion of a 1-state or 2-state idle cycle can be selected with the IDLC bit in BCR. By inserting an idle cycle it is possible, for example, to avoid data collisions between ROM, etc., with a long output floating time, and high-speed memory, I/O interfaces, and so on.

#### (1) Consecutive Reads in Different Areas

If consecutive reads in different areas occur while the ICIS1 bit is set to 1 in BCR, an idle cycle is inserted at the start of the second read cycle.

Figure 6.77 shows an example of the operation in this case. In this example, bus cycle A is a read cycle for ROM with a long output floating time, and bus cycle B is a read cycle for SRAM, each being located in a different area. In (a), an idle cycle is not inserted, and a collision occurs in bus cycle B between the read data from ROM and that from SRAM. In (b), an idle cycle is inserted, and a data collision is prevented.

**Figure 6.77 Example of Idle Cycle Operation  
(Consecutive Reads in Different Areas)**

## (2) Write after Read

If an external write occurs after an external read while the ICIS0 bit is set to 1 in BCR, an idle cycle is inserted at the start of the write cycle.

Figure 6.78 shows an example of the operation in this case. In this example, bus cycle A is a read cycle for ROM with a long output floating time, and bus cycle B is a CPU write cycle. In (a), an idle cycle is not inserted, and a collision occurs in bus cycle B between the read data from ROM and the CPU write data. In (b), an idle cycle is inserted, and a data collision is prevented.

**Figure 6.78 Example of Idle Cycle Operation (Write after Read)**

### (3) Read after Write

If an external read occurs after an external write while the ICIS2 bit is set to 1 in BCR, an idle cycle is inserted at the start of the read cycle.

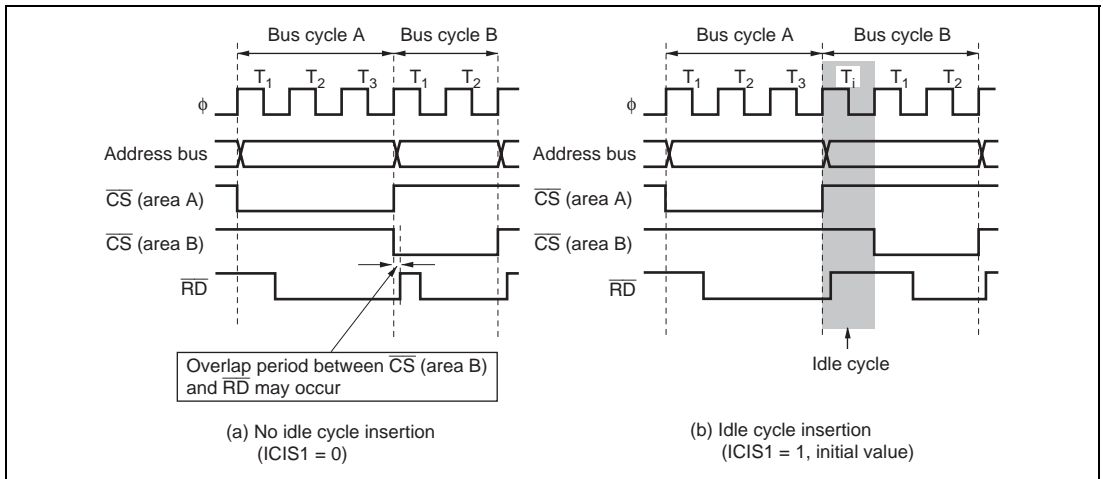

Figure 6.79 shows an example of the operation in this case. In this example, bus cycle A is a CPU write cycle and bus cycle B is a read cycle from an external device. In (a), an idle cycle is not inserted, and a collision occurs in bus cycle B between the CPU write data and read data from an external device. In (b), an idle cycle is inserted, and a data collision is prevented.

**Figure 6.79 Example of Idle Cycle Operation (Read after Write)**

#### (4) Relationship between Chip Select ( $\overline{CS}$ ) Signal and Read ( $\overline{RD}$ ) Signal

Depending on the system's load conditions, the  $\overline{RD}$  signal may lag behind the  $\overline{CS}$  signal. An example is shown in figure 6.80. In this case, with the setting for no idle cycle insertion (a), there may be a period of overlap between the bus cycle A  $\overline{RD}$  signal and the bus cycle B  $\overline{CS}$  signal. Setting idle cycle insertion, as in (b), however, will prevent any overlap between the  $\overline{RD}$  and  $\overline{CS}$  signals. In the initial state after reset release, idle cycle insertion (b) is set.

**Figure 6.80 Relationship between Chip Select ( $\overline{CS}$ ) and Read ( $\overline{RD}$ )**

### (5) Idle Cycle in Case of DRAM Space Access after Normal Space Access

In a DRAM space access following a normal space access, the settings of bits ICIS2, ICIS1, ICIS0, and IDLC in BCR are valid. However, in the case of consecutive reads in different areas, for example, if the second read is a full access to DRAM space, only a  $T_p$  cycle is inserted, and a  $T_i$  cycle is not. The timing in this case is shown in figure 6.81.

Note: The DRAM interface is not supported by the 5-V version.

**Figure 6.81 Example of DRAM Full Access after External Read  
(CAST = 0)**

In burst access in RAS down mode, the settings of bits ICIS2, ICIS1, ICIS0, and IDLC are valid and an idle cycle is inserted. The timing in this case is illustrated in figures 6.82 and 6.83.

**Figure 6.82 Example of Idle Cycle Operation in RAS Down Mode (Consecutive Reads in Different Areas) (IDLC = 0, RAST = 0, CAST = 0)**

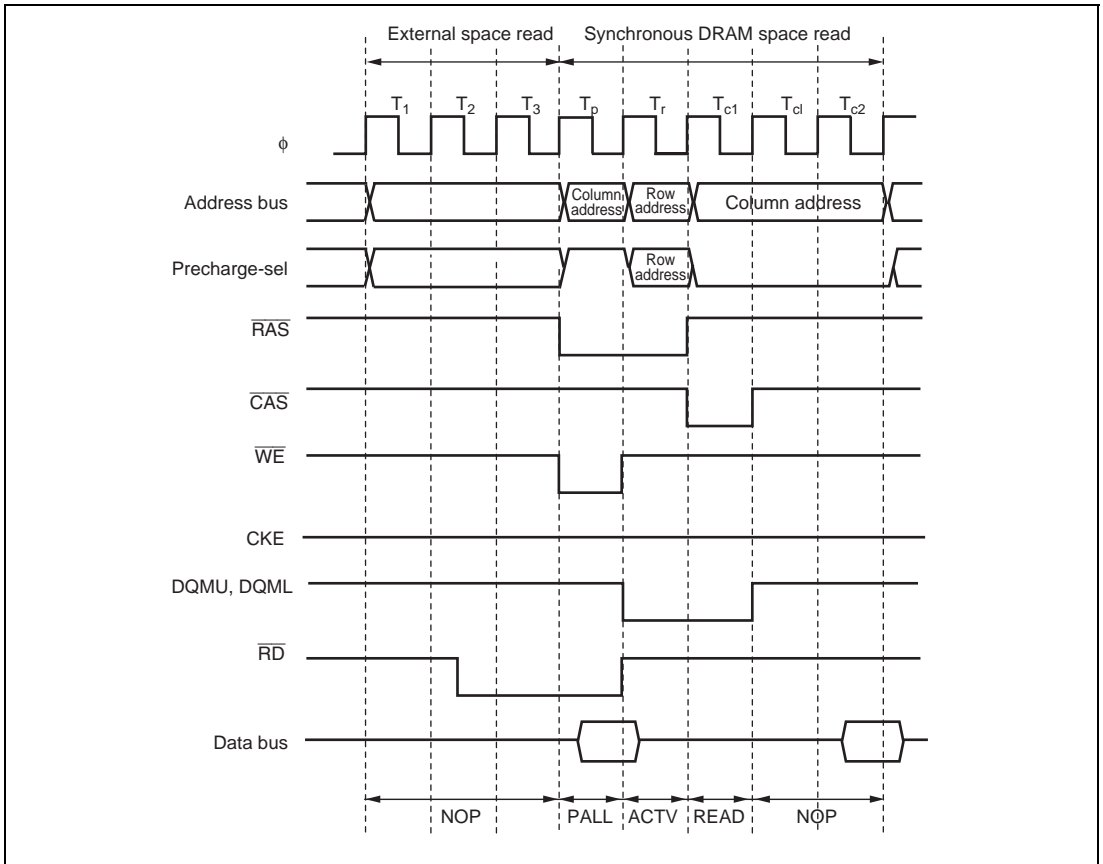

**Figure 6.83 Example of Idle Cycle Operation in RAS Down Mode (Write after Read) (IDLC = 0, RAST = 0, CAST = 0)**

## (6) Idle Cycle in Case of Continuous Synchronous DRAM Space Access after Normal Space Access

In a continuous synchronous DRAM space access following a normal space access, the settings of bits ICIS2, ICIS1, ICIS0, and IDLC in BCR are valid. However, in the case of consecutive reads in different areas, for example, if the second read is a full access to continuous synchronous DRAM space, only  $T_p$  cycle is inserted, and  $T_i$  cycle is not. The timing in this case is shown in figure 6.84.

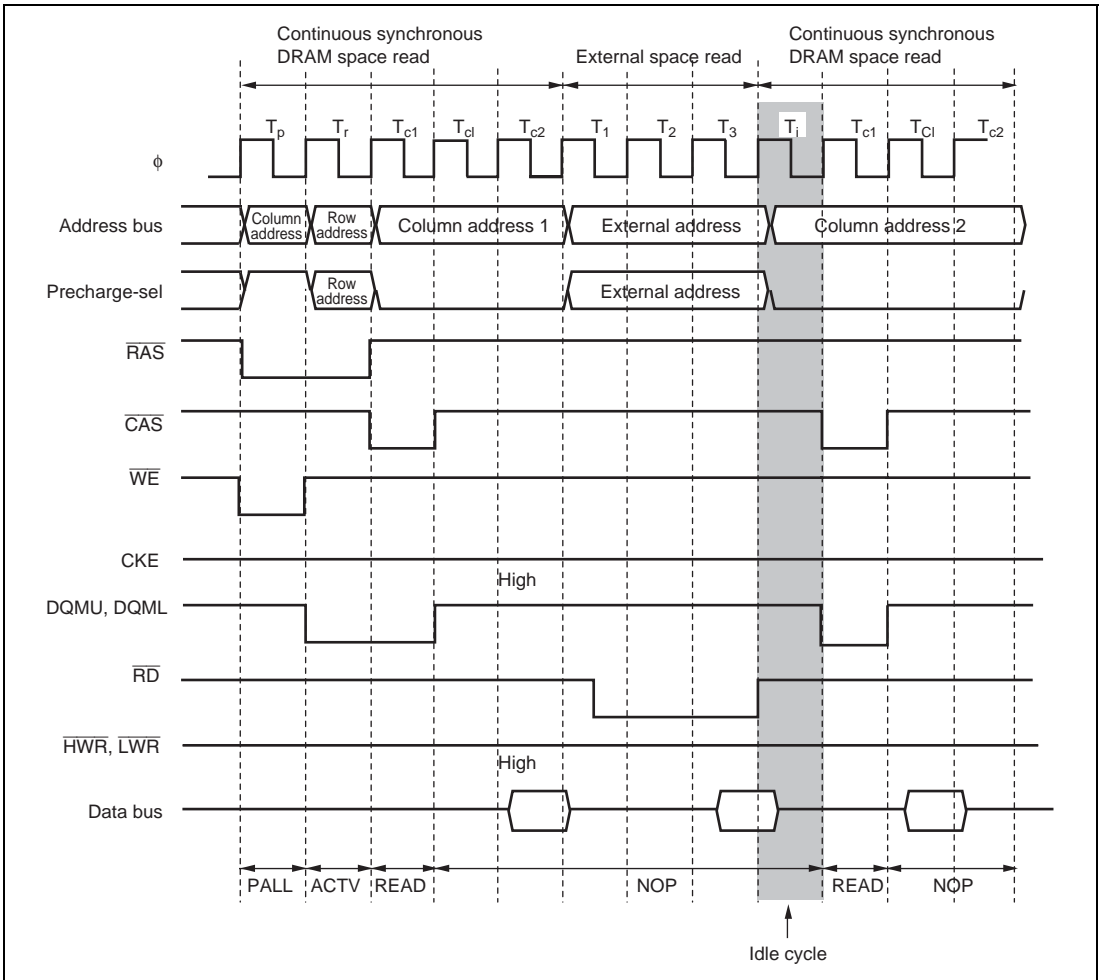

Note: The synchronous DRAM interface is not supported by the H8S/2426 Group and H8S/2424 Group.

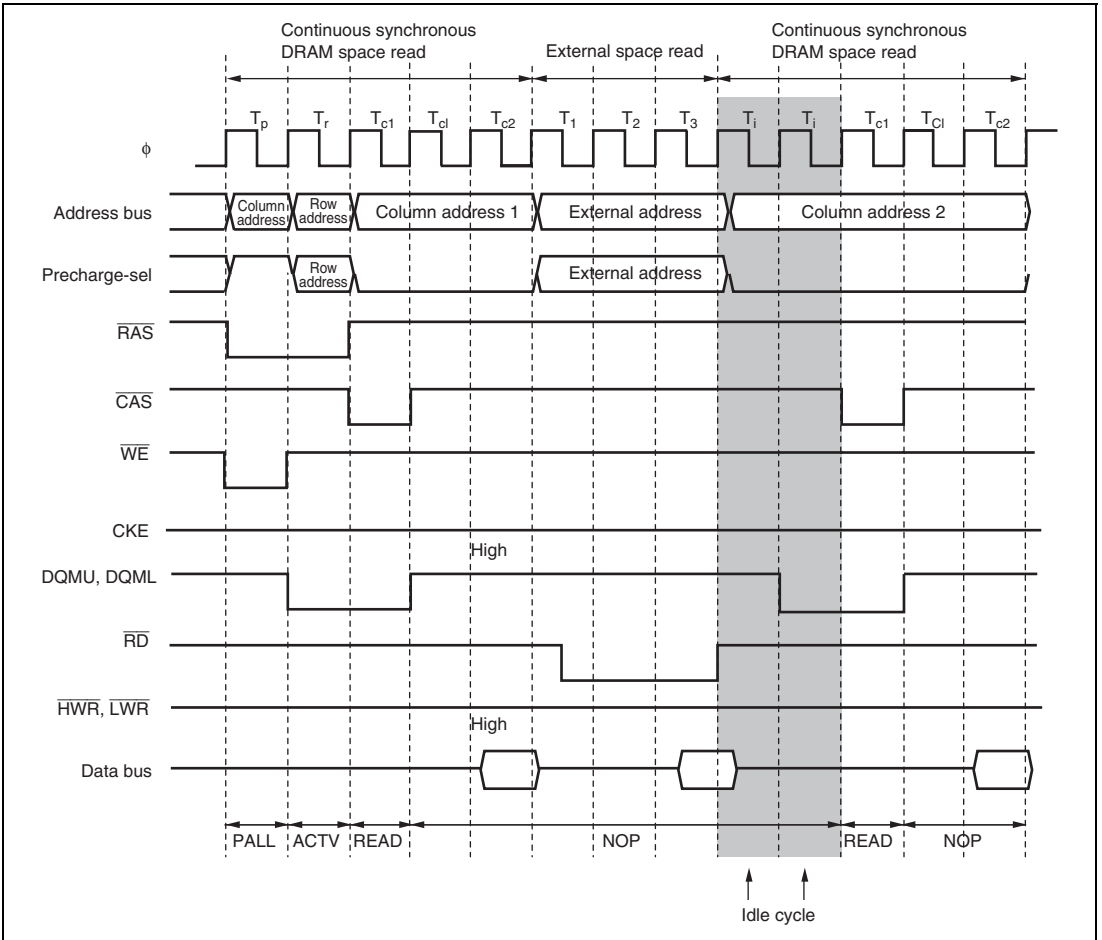

**Figure 6.84 Example of Synchronous DRAM Full Access after External Read (CAS Latency 2)**

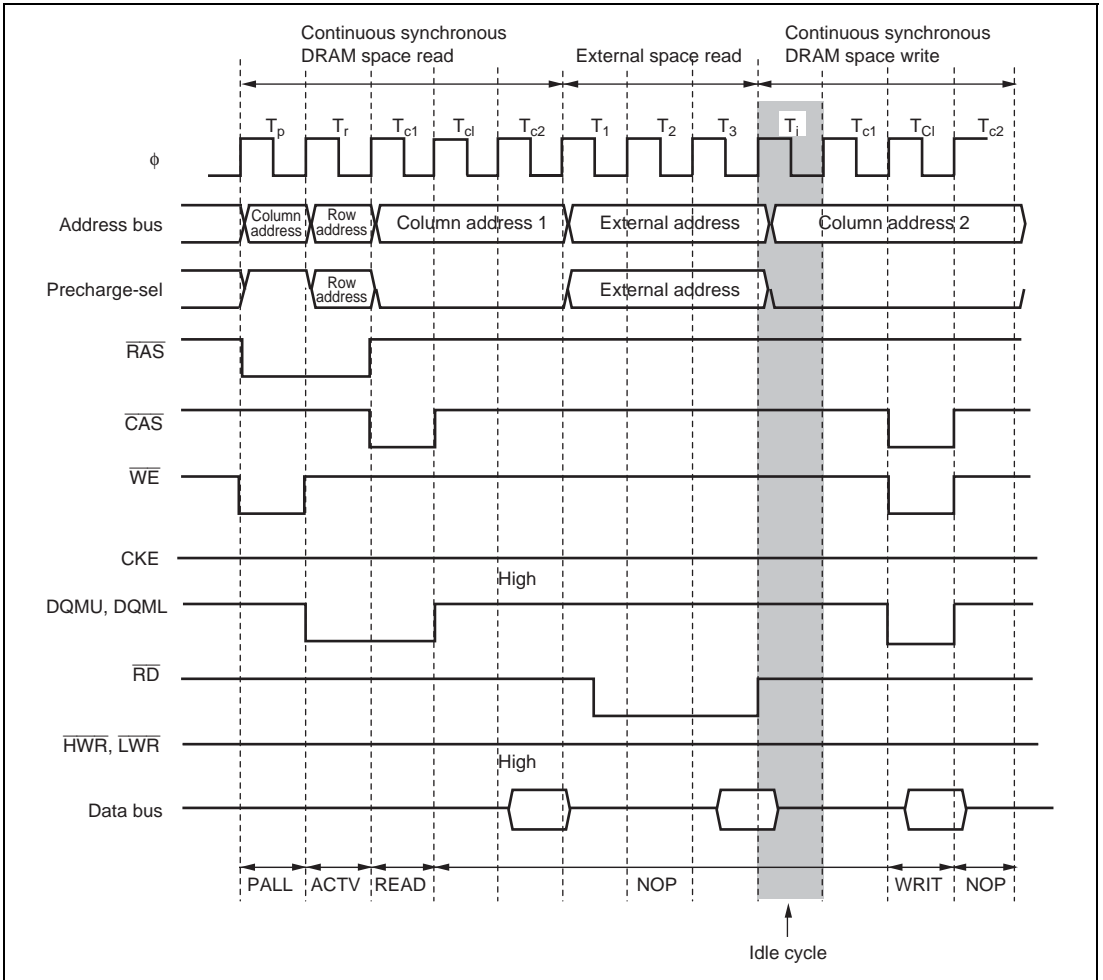

In burst access in RAS down mode, the settings of bits ICIS2, ICIS1, ICIS0, and IDLC are valid and an idle cycle is inserted. However, in read access, note that the timings of DQMU and DQML differ according to the settings of the IDLC bit. The timing in this case is illustrated in figures 6.85 and 6.86. In write access, DQMU and DQML are not in accordance with the settings of the IDLC bit. The timing in this case is illustrated in figure 6.87.

**Figure 6.85 Example of Idle Cycle Operation in RAS Down Mode (Read in Different Area) (IDLC = 0, CAS Latency 2)**

**Figure 6.86 Example of Idle Cycle Operation in RAS Down Mode (Read in Different Area) (IDLC = 1, CAS Latency 2)**

**Figure 6.87 Example of Idle Cycle Operation in RAS Down Mode (Write after Read) (IDLC = 0, CAS Latency 2)**

## (7) Idle Cycle in Case of Normal Space Access after DRAM Space Access

Note: The DRAM interface is not supported by the 5-V version.

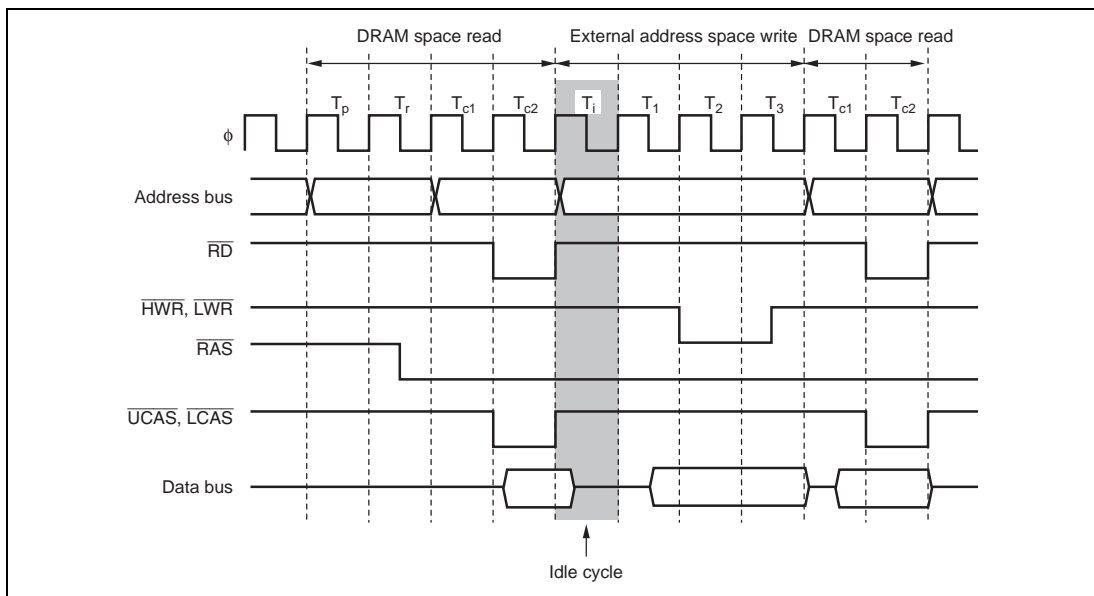

### (a) Normal space access after DRAM space read access

While the DRMI bit is cleared to 0 in DRACCR, idle cycle insertion after DRAM space access is disabled. Idle cycle insertion after DRAM space access can be enabled by setting the DRMI bit to 1. The conditions and number of states of the idle cycle to be inserted are in accordance with the settings of bits ICIS1, ICIS0, and IDLC in BCR are valid. Figures 6.88 and 6.89 show examples of idle cycle operation when the DRMI bit is set to 1.

When the DRMI bit is cleared to 0, an idle cycle is not inserted after DRAM space access even if bits ICIS1 and ICIS0 are set to 1.

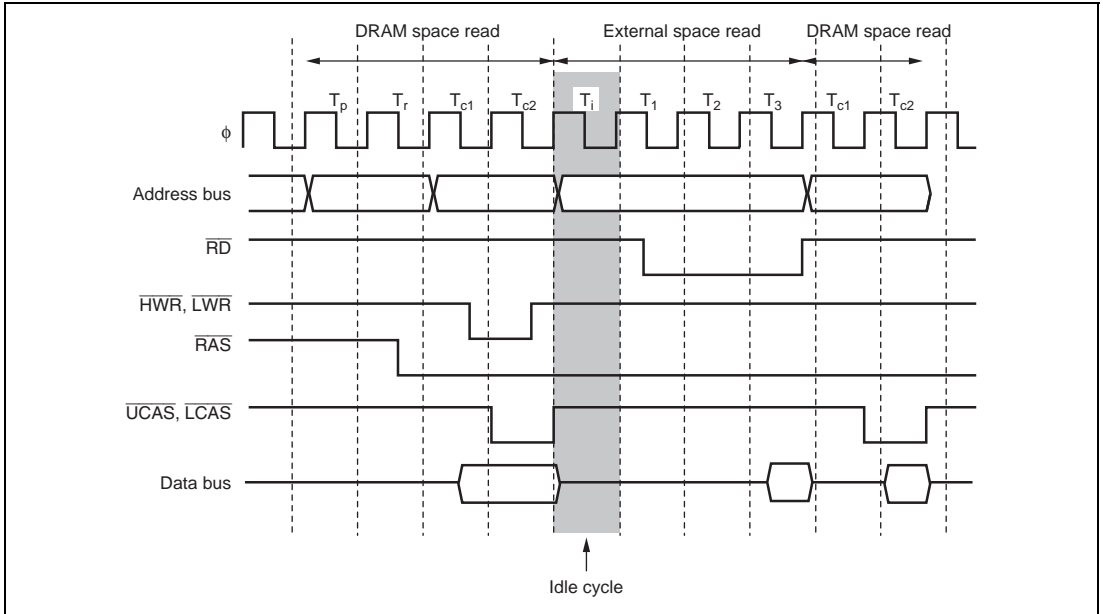

**Figure 6.88 Example of Idle Cycle Operation after DRAM Access**  
(Consecutive Reads in Different Areas) (IDLIC = 0, RAST = 0, CAST = 0)

**Figure 6.89 Example of Idle Cycle Operation after DRAM Access  
(Write after Read) (IDLC = 0, RAST = 0, CAST = 0)**

### (b) Normal space access after DRAM space write access

While the ICIS2 bit is set to 1 in BCR and a normal space read access occurs after DRAM space write access, idle cycle is inserted in the first read cycle. The number of states of the idle cycle to be inserted is in accordance with the setting of the IDLC bit. It does not depend on the DRMI bit in DRACCR. Figure 6.90 shows an example of idle cycle operation when the ICIS2 bit is set to 1.

**Figure 6.90 Example of Idle Cycle Operation after DRAM Write Access  
(IDLC = 0, ICIS1 = 0, RAST = 0, CAST = 0)**

### (8) Idle Cycle in Case of Normal Space Access after Continuous Synchronous DRAM Space Access:

Note: The synchronous DRAM interface is not supported by the H8S/2426 Group and H8S/2424 Group.

**(a) Normal space access after a continuous synchronous DRAM space read access**

While the DRMI bit is cleared to 0 in DRACCR, idle cycle insertion after continuous synchronous DRAM space read access is disabled. Idle cycle insertion after continuous synchronous DRAM space read access can be enabled by setting the DRMI bit to 1. The conditions and number of states of the idle cycle to be inserted are in accordance with the settings of bits ICIS1, ICIS0, and IDLC in RCR. Figure 6.91 shows an example of idle cycle operation when the DRMI bit is set to 1. When the DRMI bit is cleared to 0, an idle cycle is not inserted after continuous synchronous DRAM space read access even if bits ICIS1 and ICIS0 are set to 1.

**Figure 6.91 Example of Idle Cycle Operation after Continuous Synchronous DRAM Space Read Access (Read between Different Area) (IDLC = 0, CAS Latency 2)**

### (b) Normal space access after a continuous synchronous DRAM space write access

If a normal space read cycle occurs after a continuous synchronous DRAM space write access while the ICIS2 bit is set to 1 in BCR, idle cycle is inserted at the start of the read cycle. The number of states of the idle cycle to be inserted is in accordance with the setting of bit IDLC. It is not in accordance with the DRMI bit in DRACCR.

Figure 6.92 shows an example of idle cycle operation when the ICIS2 bit is set to 1.

**Figure 6.92 Example of Idle Cycle Operation after Continuous Synchronous DRAM Space Write Access (IDLC = 0, ICIS1 = 0, SDWCD = 1, CAS Latency 2)**

Table 6.12 shows whether there is an idle cycle insertion or not in the case of mixed accesses to normal space and DRAM space/continuous synchronous DRAM space.

**Table 6.12 Idle Cycles in Mixed Accesses to Normal Space and DRAM Continuous Synchronous DRAM Space**

| Previous Access   | Next Access   | ICIS2 | ICIS1 | ICIS0 | DRMI              | IDLC              | Idle cycle        |
|---|---|-------|-------|-------|-------------------|-------------------|-------------------|
| Normal space read   | Normal space read<br>(different area)   | —     | 0     | —     | —                 | —                 | Disabled          |
|   |   | —     | 1     | —     | —                 | 0                 | 1 state inserted  |
|   |   |       |       |       |                   | 1                 | 2 states inserted |

|   |  | 1     | —     | —     | —    | 0    | 1 state inserted  |
|   |  |       |       |       |      | 1    | 2 states inserted |
| DRAM <sup>*1</sup> /continuous synchronous DRAM <sup>*2</sup> space write | Normal space read  | 0     | —     | —     | —    | —    | Disabled          |
|   |  | 1     | —     | —     | —    | 0    | 1 state inserted  |
|   |  |       |       |       |      | 1    | 2 states inserted |
|   | DRAM <sup>*1</sup> /continuous synchronous DRAM <sup>*2</sup> space read | 0     | —     | —     | —    | —    | Disabled          |
|   |  | 1     | —     | —     | —    | 0    | 1 state inserted  |
|   |  |       |       |       |      | 1    | 2 states inserted |

Notes: 1. The DRAM interface is not supported by the 5-V version.

2. Not supported by the H8S/2426 Group and H8S/2424 Group.

Setting the DRMI bit in DRACCR to 1 enables an idle cycle to be inserted in the case of consecutive read and write operations in DRAM/continuous synchronous DRAM space burst access. Figures 6.93 and 6.94 show an example of the timing for idle cycle insertion in the case of consecutive read and write accesses to DRAM/continuous synchronous DRAM space.

**Figure 6.93 Example of Timing for Idle Cycle Insertion in Case of Consecutive Read and Write Accesses to DRAM Space in RAS Down Mode**

**Figure 6.94 Example of Timing for Idle Cycle Insertion in Case of Consecutive Read and Write Accesses to Continuous Synchronous DRAM Space in RAS Down Mode (SDWCD = 1, CAS Latency 2)**

## 6.10.2 Pin States in Idle Cycle

Table 6.13 shows the pin states in an idle cycle.

**Table 6.13 Pin States in Idle Cycle**

| Pins                                  | Pin State                         |
|---------------------------------------|-----------------------------------|
| A23 to A0                             | Contents of following bus cycle   |
| D15 to D0                             | High impedance                    |
| $\overline{CS}_n$ (n = 7 to 0)        | High* <sup>1</sup> * <sup>2</sup> |
| $\overline{UCAS}$ , $\overline{LCAS}$ | High* <sup>2</sup>                |
| $\overline{AS}/\overline{AH}$         | High                              |
| $\overline{RD}$                       | High                              |
| $\overline{OE}$                       | High                              |
| $\overline{HWR}$ , $\overline{LWR}$   | High                              |
| $\overline{DACK}_n$ (n = 1, 0)        | High                              |
| $\overline{EDACK}_n$ (n = 3 to 0)     | High                              |

- Notes: 1. Remains low in DRAM space RAS down mode.  
 2. Remains low in a DRAM space refresh cycle.

## 6.11 Write Data Buffer Function

This LSI has a write data buffer function for the external data bus. Using the write data buffer function enables external writes and DMA single address mode transfers to be executed in parallel with internal accesses. The write data buffer function is made available by setting the WDBE bit to 1 in BCR.

Figure 6.95 shows an example of the timing when the write data buffer function is used. When this function is used, if an external address space write or DMA single address mode transfer continues for two states or longer, and there is an internal access next, an external write only is executed in the first state, but from the next state onward an internal access (on-chip memory or internal I/O register read) is executed in parallel with the external address space write rather than waiting until it ends.

**Figure 6.95 Example of Timing when Write Data Buffer Function Is Used**

## 6.12 Bus Release

This LSI can release the external bus in response to a bus request from an external device. In the external bus released state, internal bus masters except the EXDMAC\*<sup>1</sup> continue to operate as long as there is no external access. If any of the following requests are issued in the external bus released state, the  $\overline{\text{BREQO}}$  signal can be driven low to output a bus request externally.

- When an internal bus master wants to perform an external access
- When a refresh request\*<sup>2</sup> is generated
- When a SLEEP instruction is executed to place the chip in software standby mode or all-module-clocks-stopped mode

Notes: \*1 Not supported by the H8S/2424 Group.

\*2 The refresh control is not supported by the 5-V version.

### 6.12.1 Operation

In externally expanded mode, the bus can be released to an external device by setting the BRLE bit to 1 in BCR. Driving the  $\overline{\text{BREQ}}$  pin low issues an external bus request to this LSI. When the  $\overline{\text{BREQ}}$  pin is sampled, at the prescribed timing the  $\overline{\text{BACK}}$  pin is driven low, and the address bus, data bus, and bus control signals are placed in the high-impedance state, establishing the external bus released state.

In the external bus released state, internal bus masters except the EXDMAC\*<sup>1</sup> can perform accesses using the internal bus. When an internal bus master wants to make an external access, it temporarily defers initiation of the bus cycle, and waits for the bus request from the external bus master to be canceled. If a refresh request is generated in the external bus released state, or if a SLEEP instruction is executed to place the chip in software standby mode or all-module-clocks-stopped mode, refresh control and software standby or all-module-clocks-stopped control is deferred until the bus request from the external bus master is canceled.

If the BREQOE bit is set to 1 in BCR, the  $\overline{\text{BREQO}}$  pin can be driven low when any of the following requests are issued, to request cancellation of the bus request externally.

- When an internal bus master wants to perform an external access
- When a refresh request\*<sup>2</sup> is generated
- When a SLEEP instruction is executed to place the chip in software standby mode or all-module-clocks-stopped mode

When the  $\overline{\text{BREQ}}$  pin is driven high, the  $\overline{\text{BACK}}$  pin is driven high at the prescribed timing and the external bus released state is terminated.

If an external bus release request and external access occur simultaneously, the order of priority is as follows:

(High) External bus release > External access by internal bus master (Low)

If a refresh request\*<sup>2</sup> and external bus release request occur simultaneously, the order of priority is as follows:

(High) Refresh\*<sup>2</sup> > External bus release (Low)

- Notes: 1. Not supported by the H8S/2424 Group.  
2. Not supported by the 5-V version.

### 6.12.2 Pin States in External Bus Released State

Table 6.14 shows pin states in the external bus released state.

**Table 6.14 Pin States in Bus Released State**

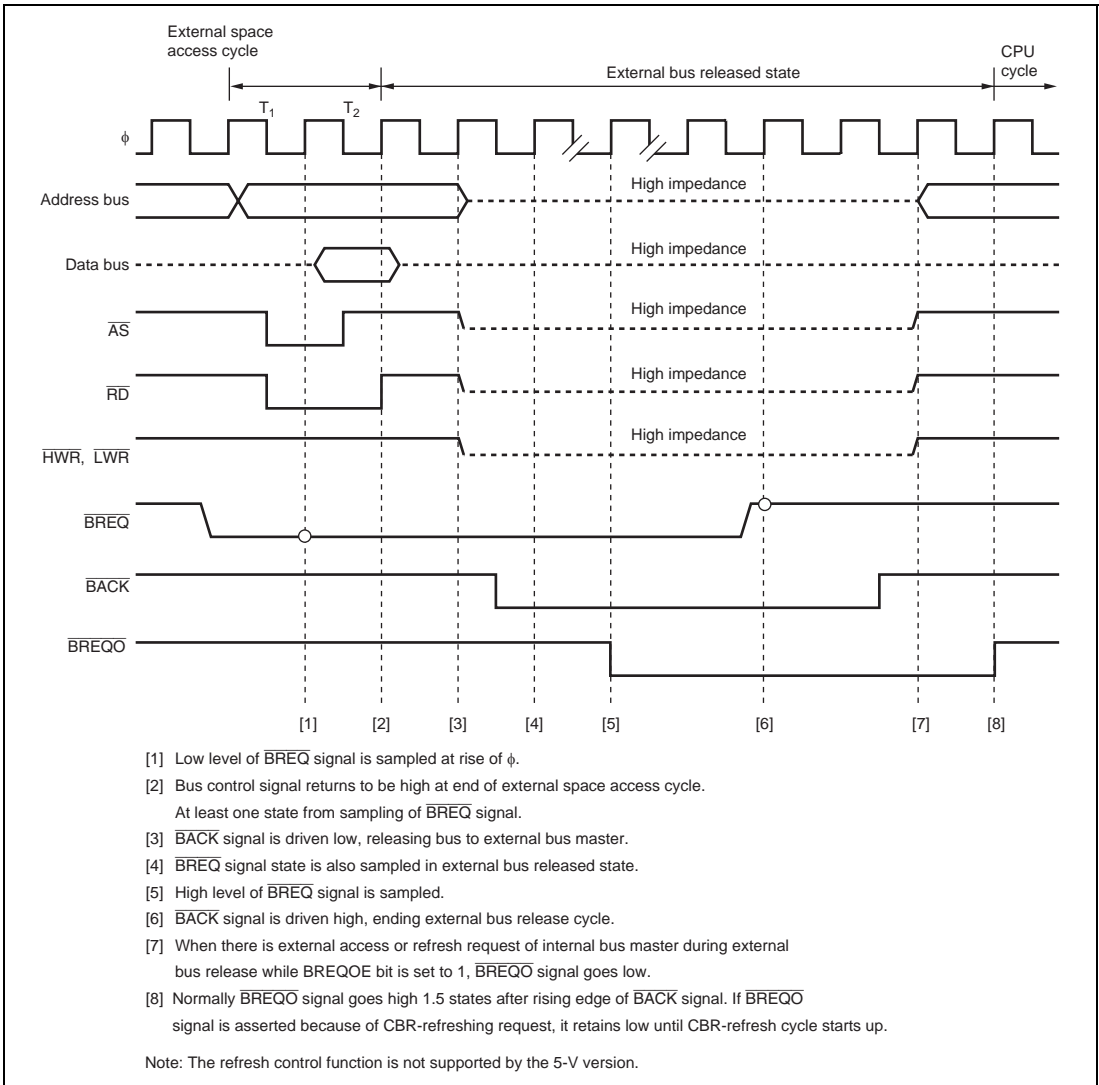

| Pins  | Pin State      |
|---|----------------|
| A23 to A0   | High impedance |
| D15 to D0   | High impedance |
| $\overline{\text{CSn}}$ (n = 7 to 0)                | High impedance |
| $\overline{\text{UCAS}}$ , $\overline{\text{LCAS}}$ | High impedance |
| $\overline{\text{AS/AH}}$                           | High impedance |
| $\overline{\text{RD}}$                              | High impedance |
| $\overline{\text{OE}}$                              | High impedance |
| $\overline{\text{HWR}}$ , $\overline{\text{LWR}}$   | High impedance |
| $\overline{\text{DACKn}}$ (n = 1, 0)                | High           |
| $\overline{\text{EDACKn}}$ * (n = 3, 2)             | High           |

Note: \* Not supported by the H8S/2424 Group.

### 6.12.3 Transition Timing

Figure 6.96 shows the timing for transition to the bus released state.

**Figure 6.96 Bus Released State Transition Timing**

Figure 6.97 shows the timing for transition to the bus released state with the synchronous DRAM interface.

**Figure 6.97 Bus Release State Transition Timing when Synchronous DRAM Interface**

Note: The synchronous DRAM interface is not supported by the H8S/2426 Group and H8S/2424 Group.

## 6.13 Bus Arbitration

This LSI has a bus arbiter that arbitrates bus mastership operations (bus arbitration).

There are four bus masters—the CPU, DTC, DMAC, and EXDMAC\*—that perform read/write operations when they have possession of the bus. Each bus master requests the bus by means of a bus request signal. The bus arbiter determines priorities at the prescribed timing, and permits use of the bus by means of a bus request acknowledge signal. The selected bus master then takes possession of the bus and begins its operation.

Note: \* The EXDMAC is not supported by the H8S/2424 Group.

### 6.13.1 Operation

The bus arbiter detects the bus masters' bus request signals, and if the bus is requested, sends a bus request acknowledge signal to the bus master. If there are bus requests from more than one bus master, the bus request acknowledge signal is sent to the one with the highest priority. When a bus master receives the bus request acknowledge signal, it takes possession of the bus until that signal is canceled.

The order of priority of the bus mastership is as follows:

(High) EXDMAC\*<sup>2</sup> > DMAC > DTC > CPU (Low)

An internal bus access by internal bus masters except the EXDMAC\*<sup>2</sup> and external bus release, a refresh when the CBRM bit is 0, and an external bus access by the EXDMAC\*<sup>2</sup> can be executed in parallel.

If an external bus release request, a refresh request\*<sup>1</sup>, and an external access by an internal bus master occur simultaneously, the order of priority is as follows:

(High) Refresh\*<sup>1</sup> > EXDMAC\*<sup>2</sup> > External bus release (Low)

(High) External bus release > External access by internal bus master except EXDMAC\*<sup>2</sup> (Low)

As a refresh\*<sup>1</sup> when the CBRM bit in REFCR is cleared to 0 and an external access other than to DRAM space by an internal bus master can be executed simultaneously, there is no relative order of priority for these two operations.

Notes: 1. Not supported by the 5-V version.

2. The EXDMAC is not supported by the H8S/2424 Group.

### 6.13.2 Bus Transfer Timing

Even if a bus request is received from a bus master with a higher priority than that of the bus master that has acquired the bus and is currently operating, the bus is not necessarily transferred immediately. There are specific timings at which each bus master can relinquish the bus.

#### (1) CPU

The CPU is the lowest-priority bus master, and if a bus request is received from the DTC, DMAC, or EXDMAC\*, the bus arbiter transfers the bus to the bus master that issued the request. The timing for transfer of the bus is as follows:

- The bus is transferred at a break between bus cycles. However, if a bus cycle is executed in discrete operations, as in the case of a longword-size access, the bus is not transferred between the component operations.
- With bit manipulation instructions such as BSET and BCLR, the sequence of operations is: data read (read), relevant bit manipulation operation (modify), write-back (write). The bus is not transferred during this read-modify-write cycle, which is executed as a series of bus cycles.
- If the CPU is in sleep mode, the bus is transferred immediately.

Note: \* The EXDMAC is not supported by the H8S/2424 Group.

#### (2) DTC

The DTC sends the bus arbiter a request for the bus when an activation request is generated.

The DTC can release the bus after a vector read, a register information read (3 states), a single data transfer, or a register information write (3 states). It does not release the bus during a register information read (3 states), a single data transfer, or a register information write (3 states).

#### (3) DMAC

The DMAC sends the bus arbiter a request for the bus when an activation request is generated.

In the case of an external request in short address mode or normal mode, and in cycle steal mode, the DMAC releases the bus after a single transfer.

In block transfer mode, it releases the bus after transfer of one block, and in burst mode, after completion of the transfer. However, in the event of an EXDMAC\* or external bus release request, which have a higher priority than the DMAC, the bus may be transferred to the bus master even if block or burst transfer is in progress.

Note: \* Not supported by the H8S/2424 Group.

#### (4) EXDMAC

The EXDMAC sends the bus arbiter a request for the bus when an activation request is generated.

As the EXDMAC is used exclusively for transfers to and from the external bus, if the bus is transferred to the EXDMAC, internal accesses by other internal bus masters are still executed in parallel.

In normal transfer mode or cycle steal transfer mode, the EXDMAC releases the bus after a single transfer.

In block transfer mode, it releases the bus after transfer of one block, and in burst transfer mode, after completion of the transfer. By setting the BGUP bit to 1 in EDMDR, it is possible to specify temporary release of the bus in the event of an external access request from an internal bus master. For details see section 8, EXDMA Controller (EXDMAC).

Note: The EXDMAC is not supported by the H8S/2424 Group.

#### (5) External Bus Release

When the  $\overline{\text{BREQ}}$  pin goes low and an external bus release request is issued while the BRLE bit is set to 1 in BCR, a bus request is sent to the bus arbiter.

External bus release can be performed on completion of an external bus cycle.

### 6.14 Bus Controller Operation in Reset

In a reset, this LSI, including the bus controller, enters the reset state immediately, and any executing bus cycle is aborted.

## 6.15 Usage Notes

### 6.15.1 External Bus Release Function and All-Module-Clocks-Stopped Mode

In this LSI, if the ACSE bit is set to 1 in MSTPCR, and then a SLEEP instruction is executed with the setting for all peripheral module clocks to be stopped (MSTPCR = H'FFFF, EXMSTPCR = H'FFFF) or for operation of the 8-bit timer module alone (MSTPCR = H'FFFE, EXMSTPCR = H'FFFF), and a transition is made to the sleep state, the all-module-clocks-stopped mode is entered in which the clock is also stopped for the bus controller and I/O ports. In this state, the external bus release function is halted. To use the external bus release function in sleep mode, the ACSE bit in MSTPCR must be cleared to 0. Conversely, if a SLEEP instruction to place the chip in all-module-clocks-stopped mode is executed in the external bus released state, the transition to all-module-clocks-stopped mode is deferred and performed until after the bus is recovered.

### 6.15.2 External Bus Release Function and Software Standby

In this LSI, internal bus master operation does not stop even while the bus is released, as long as the program is running in on-chip ROM, etc., and no external access occurs. If a SLEEP instruction to place the chip in software standby mode is executed while the external bus is released, the transition to software standby mode is deferred and performed after the bus is recovered.

Also, since clock oscillation halts in software standby mode, if  $\overline{\text{BREQ}}$  goes low in this mode, indicating an external bus release request, the request cannot be answered until the chip has recovered from the software standby state.

### 6.15.3 External Bus Release Function and CBR Refreshing/Auto Refreshing

CBR refreshing<sup>\*1</sup>/auto refreshing<sup>\*2</sup> cannot be executed while the external bus is released. Setting the BREQOE bit to 1 in BCR beforehand enables the  $\overline{\text{BREQO}}$  signal to be output when a CBR refresh<sup>\*1</sup>/auto refresh<sup>\*2</sup> request is issued.

- Notes:
1. The auto refresh control function is not supported by the H8S/2426 Group and H8S/2424 Group.
  2. The CBR refreshing control is not supported by the 5-V version.

### 6.15.4 $\overline{\text{BREQO}}$ Output Timing

When the BREQOE bit is set to 1 and the  $\overline{\text{BREQO}}$  signal is output,  $\overline{\text{BREQO}}$  may go low before the  $\overline{\text{BACK}}$  signal.

This will occur if the next external access request or CBR refresh request occurs while internal bus arbitration is in progress after the chip samples a low level of  $\overline{\text{BREQO}}$ .

Note: The CBR refreshing control is not supported by the 5-V version.

### 6.15.5 Notes on Usage of the Synchronous DRAM

#### (1) Connection Clock

Be sure to set the clock to be connected to the synchronous DRAM to SDRAM $\phi$ .

#### (2) $\overline{\text{WAIT}}$ Pin

In the continuous synchronous DRAM space, insertion of the wait state by the  $\overline{\text{WAIT}}$  pin is disabled regardless of the setting of the WAITE bit in BCR.

#### (3) Bank Control

This LSI cannot carry out the bank control of the synchronous DRAM. All banks are selected.

#### (4) Burst Access

The burst read/burst write mode of the synchronous DRAM is not supported. When setting the mode register of the synchronous DRAM, set to the burst read/single write and set the burst length to 1.

#### (5) CAS Latency

When connecting a synchronous DRAM having CAS latency of 1, set the BE bit to 0 in the DRAMCR.

Note: The synchronous DRAM interface is not supported by the H8S/2426 Group and H8S/2424 Group.

## Section 7 DMA Controller (DMAC)

This LSI has a built-in DMA controller (DMAC), which can carry out data transfer on up to 4 channels.

### 7.1 Features

- Selectable as short address mode or full address mode

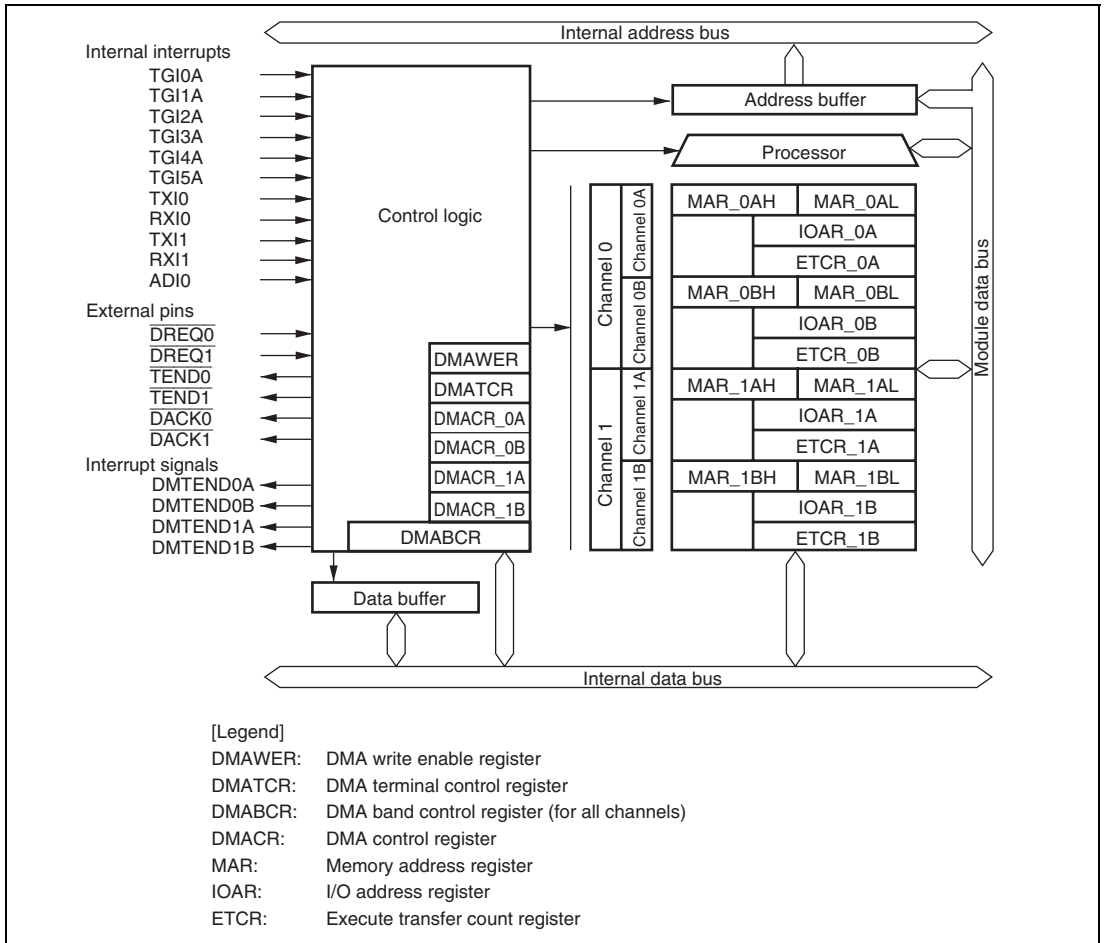

#### Short address mode

- Maximum of 4 channels can be used.
- Dual address mode or single address mode can be selected.
- In dual address mode, one of the two addresses, transfer source and transfer destination, is specified as 24 bits and the other as 16 bits.
- In single address mode, transfer source or transfer destination address only is specified as 24 bits.
- In single address mode, transfer can be performed in one bus cycle.
- Choice of sequential mode, idle mode, or repeat mode for dual address mode and single address mode

#### Full address mode

- Maximum of 2 channels can be used.
- Transfer source and transfer destination addresses as specified as 24 bits
- Choice of normal mode or block transfer mode
- 16-Mbyte address space can be specified directly.
- Byte or word can be set as the transfer unit.
- Activation sources: internal interrupt, external request, auto-request (depending on transfer mode)
  - Six compare match/input capture interrupts of 16-bit timer-pulse unit (TPU0 to 5).
  - Transmission complete interrupt and reception complete interrupt of serial communication interface (SCI\_0, SCI\_1)
  - Conversion end interrupt by the A/D converter (A/D\_0)
  - External request
  - Auto-request
- Module stop state can be set.

A block diagram of the DMAC is shown in figure 7.1.

**Figure 7.1 Block Diagram of DMAC**

## 7.2 Input/Output Pins

Table 7.1 shows the pin configuration of the interrupt controller.

**Table 7.1 Pin Configuration**

| Channel | Pin Name                   | Symbol                    | I/O    | Function                                      |
|---------|----------------------------|---------------------------|--------|---|
| 0       | DMA request 0              | $\overline{\text{DREQ0}}$ | Input  | Channel 0 external request                    |
|         | DMA transfer acknowledge 0 | $\overline{\text{DACK0}}$ | Output | Channel 0 single address transfer acknowledge |
|         | DMA transfer end 0         | $\overline{\text{TEND0}}$ | Output | Channel 0 transfer end                        |
| 1       | DMA request 1              | $\overline{\text{DREQ1}}$ | Input  | Channel 1 external request                    |
|         | DMA transfer acknowledge 1 | $\overline{\text{DACK1}}$ | Output | Channel 1 single address transfer acknowledge |
|         | DMA transfer end 1         | $\overline{\text{TEND1}}$ | Output | Channel 1 transfer end                        |

### 7.3 Register Descriptions

- Memory address register\_0AH (MAR\_0AH)
- Memory address register\_0AL (MAR\_0AL)
- I/O address register\_0A (IOAR\_0A)
- Transfer count register\_0A (ECTR\_0A)
- Memory address register\_0BH (MAR\_0BH)
- Memory address register\_0BL (MAR\_0BL)
- I/O address register\_0B (IOAR\_0B)
- Transfer count register\_0B (ECTR\_0B)
- Memory address register\_1AH (MAR\_1AH)
- Memory address register\_1AL (MAR\_1AL)
- I/O address register\_1A (IOAR\_1A)
- Transfer count register\_1A (ETCR\_1A)
- Memory address register\_1BH (MAR\_1BH)
- Memory address register\_1BL (MAR\_1BL)
- I/O address register\_1B (IOAR\_1B)
- Transfer count register\_1B (ETCR\_1B)
- DMA control register\_0A (DMACR\_0A)
- DMA control register\_0B (DMACR\_0B)
- DMA control register\_1A (DMACR\_1A)
- DMA control register\_1B (DMACR\_1B)
- DMA band control register H (DMABCRH)
- DMA band control register L (DMABCR L)
- DMA write enable register (DMAWER)
- DMA terminal control register (DMATCR)

The functions of MAR, IOAR, ETCR, DMACR, and DMABCR differ according to the transfer mode (short address mode or full address mode). The transfer mode can be selected by means of the FAE1 and FAE0 bits in DMABCRH. The register configurations for short address mode and full address mode of channel 0 are shown in table 7.2.

**Table 7.2 Short Address Mode and Full Address Mode (Channel 0)****FAEO Description**

0 Short address mode specified (channels 0A and 0B operate independently)

|            |         |          |   |  |
|------------|---------|----------|---|--|
| Channel 0A | MAR_0AH | MAR_0AL  | ← | Specifies transfer source/transfer destination address |
|            |         | IOAR_0A  | ← | Specifies transfer destination/transfer source address |
|            |         | ETCR_0A  | ← | Specifies number of transfers                          |
|            |         | DMACR_0A | ← | Specifies transfer size, mode, activation source.      |
| Channel 0B | MAR_0BH | MAR_0BL  | ← | Specifies transfer source/transfer destination address |
|            |         | IOAR_0B  | ← | Specifies transfer destination/transfer source address |
|            |         | ETCR_0B  | ← | Specifies number of transfers                          |
|            |         | DMACR_0B | ← | Specifies transfer size, mode, activation source.      |

1 Full address mode specified (channels 0A and 0B operate in combination as channel 0)

|           |         |          |          |  |
|-----------|---------|----------|----------|--|
| Channel 0 | MAR_0AH | MAR_0AL  | ←        | Specifies transfer source address                                |
|           | MAR_0BH | MAR_0BL  | ←        | Specifies transfer destination address                           |
|           |         | IOAR_0A  | ←        | Not used   |
|           |         | IOAR_0B  | ←        | Not used   |
|           |         | ETCR_0A  | ←        | Specifies number of transfers                                    |
|           |         | ETCR_0B  | ←        | Specifies number of transfers (used in block transfer mode only) |
|           |         | DMACR_0A | DMACR_0B | ←  |

### 7.3.1 Memory Address Registers (MARA and MARB)

MAR is a 32-bit readable/writable register that specifies the source address (transfer source address) or destination address (transfer destination address). MAR consists of two 16-bit registers MARH and MARL. The upper 8 bits of MARH are reserved: they are always read as 0, and cannot be modified.

The DMA has four MAR registers: MAR\_0A in channel 0 (channel 0A), MAR\_0B in channel 0 (channel 0B), MAR\_1A in channel 1 (channel 1A), and MAR\_1B in channel 1 (channel 1B).

MAR is not initialized by a reset or in standby mode.

**Short Address Mode:** In short address mode, MARA and MARB operate independently. Whether MAR functions as the source address register or as the destination address register can be selected by means of the DTDIR bit in DMACR.

MAR is incremented or decremented each time a byte or word transfer is executed, so that the address specified by MAR is constantly updated.

**Full Address Mode:** In full address mode, MARA functions as the source address register, and MARB as the destination address register.

MAR is incremented or decremented each time a byte or word transfer is executed, so that the source or destination address is constantly updated.

### 7.3.2 I/O Address Registers (IOARA and IOARB)

IOAR is a 16-bit readable/writable register that specifies the lower 16 bits of the source address (transfer source address) or destination address (transfer destination address). The upper 8 bits of the transfer address are automatically set to H'FF.

The DMA has four IOAR registers: IOAR\_0A in channel 0 (channel 0A), IOAR\_0B in channel 0 (channel 0B), IOAR\_1A in channel 1 (channel 1A), and IOAR\_1B in channel 1 (channel 1B).

Whether IOAR functions as the source address register or as the destination address register can be selected by means of the DTDIR bit in DMACR.

IOAR is not incremented or decremented each time a data transfer is executed, so the address specified by IOAR is fixed.

IOAR is not initialized by a reset or in standby mode.

IOAR can be used in short address mode but not in full address mode.

### 7.3.3 Execute Transfer Count Registers (ETCRA and ETCRB)

ETCR is a 16-bit readable/writable register that specifies the number of transfers.

The DMA has four ETCR registers: ETCR\_0A in channel 0 (channel 0A), ETCR\_0B in channel 0 (channel 0B), ETCR\_1A in channel 1 (channel 1A), and ETCR\_1B in channel 1 (channel 1B).

ETCR is not initialized by a reset or in standby mode.

## (1) Short Address Mode

The function of ETCR in sequential mode and idle mode differs from that in repeat mode.

In sequential mode and idle mode, ETCR functions as a 16-bit transfer counter. ETCR is decremented by 1 each time a transfer is performed, and when the count reaches H'00, the DTE bit in DMABCRL is cleared, and transfer ends.

In repeat mode, ETCRL functions as an 8-bit transfer counter and ETCRH functions as a transfer count holding register. ETCRL is decremented by 1 each time a transfer is performed, and when the count reaches H'00, ETCRL is loaded with the value in ETCRH. At this point, MAR is automatically restored to the value it had when the count was started. The DTE bit in DMABCRL is not cleared, and so transfers can be performed repeatedly until the DTE bit is cleared by the user.

## (2) Full Address Mode

The function of ETCR in normal mode differs from that in block transfer mode.

In normal mode, ETCRA functions as a 16-bit transfer counter. ETCRA is decremented by 1 each time a data transfer is performed, and transfer ends when the count reaches H'0000. ETCRB is not used in normal mode.

In block transfer mode, ETCRA functions as an 8-bit block size counter (ETCRAL) and ETCRAH functions as a block size holding register. ETCRAL is decremented by 1 each time a 1-byte or 1-word transfer is performed, and when the count reaches H'00, ETCRAL is loaded with the value in ETCRAH. So by setting the block size in ETCRAH and ETCRAL, it is possible to repeatedly transfer blocks consisting of any desired number of bytes or words.

In block transfer mode, ETCRB functions as a 16-bit block transfer counter. ETCRB is decremented by 1 each time a block is transferred, and transfer ends when the count reaches H'0000.

### 7.3.4 DMA Control Registers (DMACRA and DMACRB)

DMACR controls the operation of each DMAC channel.

The DMA has four DMACR registers: DMACR\_0A in channel 0 (channel 0A), DMACR\_0B in channel 0 (channel 0B), DMACR\_1A in channel 1 (channel 1A), and DMACR\_1B in channel 1 (channel 1B). In short address mode, channels A and B operate independently, and in full address mode, channels A and B operate together. The bit functions in the DMACR registers differ according to the transfer mode.

#### (1) Short Address Mode

- DMACR\_0A, DMACR\_0B, DMACR\_1A, and DMARC\_1B

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|

x: Don't care

### 7.3.5 DMA Band Control Registers H and L (DMABCRH and DMABCRL)

DMABCR controls the operation of each DMAC channel. The bit functions in the DMABCR registers differ according to the transfer mode.

#### (1) Short Address Mode

- DMABCRH

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 15  | FAE1     | 0             | R/W | Full Address Enable 1<br>Specifies whether channel 1 is to be used in short address mode or full address mode. In short address mode, channels 1A and 1B can be used as independent channels.<br>0: Short address mode<br>1: Full address mode |
| 14  | FAE0     | 0             | R/W | Full Address Enable 0<br>Specifies whether channel 0 is to be used in short address mode or full address mode. In short address mode, channels 0A and 0B can be used as independent channels.<br>0: Short address mode<br>1: Full address mode |
| 13  | SAE1     | 0             | R/W | Single Address Enable 1<br>Specifies whether channel 1B is to be used for transfer in dual address mode or single address mode. This bit is invalid in full address mode.<br>0: Dual address mode<br>1: Single address mode                    |
| 12  | SAE0     | 0             | R/W | Single Address Enable 0<br>Specifies whether channel 0B is to be used for transfer in dual address mode or single address mode. This bit is invalid in full address mode.<br>0: Dual address mode<br>1: Single address mode                    |

| Bit | Bit Name | Initial Value | R/W | Description                  |
|-----|----------|---------------|-----|------------------------------|
| 11  | DTA1B    | 0             | R/W | Data Transfer Acknowledge 1B |
| 10  | DTA1A    | 0             | R/W | Data Transfer Acknowledge 1A |
| 9   | DTA0B    | 0             | R/W | Data Transfer Acknowledge 0B |
| 8   | DTA0A    | 0             | R/W | Data Transfer Acknowledge 0A |

These bits enable or disable clearing when DMA transfer is performed for the internal interrupt source selected by the DTF3 to DTF0 bits in DMACR.

If the DTA bit is set to 1 when DTE = 1, the internal interrupt source is cleared automatically by DMA transfer. When DTE = 1 and DTA = 1, the internal interrupt source does not issue an interrupt request to the CPU or DTC.

If the DTA bit is cleared to 0 when DTE = 1, the internal interrupt source is not cleared when a transfer is performed, and can issue an interrupt request to the CPU or DTC in parallel. In this case, the interrupt source should be cleared by the CPU or DTC transfer.

When DTE = 0, the internal interrupt source issues an interrupt request to the CPU or DTC regardless of the DTA bit setting.

- DMABCRL

| Bit | Bit Name | Initial Value | R/W | Description             |
|-----|----------|---------------|-----|-------------------------|
| 7   | DTE1B    | 0             | R/W | Data Transfer Enable 1B |
| 6   | DTE1A    | 0             | R/W | Data Transfer Enable 1A |
| 5   | DTE0B    | 0             | R/W | Data Transfer Enable 0B |
| 4   | DTE0A    | 0             | R/W | Data Transfer Enable 0A |

If the DTE bit is cleared to 0 when DTIE = 1, the DMAC regards this as indicating the end of a transfer, and issues a transfer end interrupt request to the CPU or DTC.

When DTE = 0, data transfer is disabled and the DMAC ignores the activation source selected by the DTF3 to DTF0 bits in DMACR.

When DTE = 1, data transfer is enabled and the DMAC waits for a request by the activation source selected by the DTF3 to DTF0 bits in DMACR. When a request is issued by the activation source, DMA transfer is executed.

[Clearing conditions]

- When initialization is performed
- When the specified number of transfers have been completed in a transfer mode other than repeat mode
- When 0 is written to the DTE bit to forcibly suspend the transfer, or for a similar reason

[Setting condition]

When 1 is written to the DTE bit after reading DTE = 0

| Bit | Bit Name | Initial Value | R/W | Description                           |
|-----|----------|---------------|-----|---------------------------------------|
| 3   | DTIE1B   | 0             | R/W | Data Transfer End Interrupt Enable 1B |
| 2   | DTIE1A   | 0             | R/W | Data Transfer End Interrupt Enable 1A |
| 1   | DTIE0B   | 0             | R/W | Data Transfer End Interrupt Enable 0B |
| 0   | DTIE0A   | 0             | R/W | Data Transfer End Interrupt Enable 0A |

These bits enable or disable an interrupt to the CPU or DTC when transfer ends. If the DTIE bit is set to 1 when DTE = 0, the DMAC regards this as indicating the end of a transfer, and issues a transfer end interrupt request to the CPU or DTC.

A transfer end interrupt can be canceled either by clearing the DTIE bit to 0 in the interrupt handling routine, or by performing processing to continue transfer by setting the transfer counter and address register again, and then setting the DTE bit to 1.

## (2) Full Address Mode:

- DMABCRH

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 15  | F AE1    | 0             | R/W | Full Address Enable 1<br>Specifies whether channel 1 is to be used in short address mode or full address mode.<br>In full address mode, channels 1A and 1B are used together as channel 1.<br>0: Short address mode<br>1: Full address mode |
| 14  | F AE0    | 0             | R/W | Full Address Enable 0<br>Specifies whether channel 0 is to be used in short address mode or full address mode.<br>In full address mode, channels 0A and 0B are used together as channel 0.<br>0: Short address mode<br>1: Full address mode |

| Bit    | Bit Name | Initial Value | R/W | Description   |

### 7.3.6 DMA Write Enable Register (DMAWER)

The DMAC can activate the DTC with a transfer end interrupt, rewrite the channel on which the transfer ended using a DTC chain transfer, and then reactivate the DTC. DMAWER applies restrictions for changing all bits of DMACR, and specific bits for DMATCR and DMABCR for the specific channel, to prevent inadvertent rewriting of registers other than those for the channel concerned. The restrictions applied by DMAWER are valid for the DTC.

| Bit    | Bit Name | Initial Value | R/W | Description  |
|--------|----------|---------------|-----|--|
| 7 to 4 | —        | All 0         | —   | Reserved<br>These bits are always read as 0 and cannot be modified.  |
| 3      | WE1B     | 0             | R/W | Write Enable 1B<br>Enables or disables writes to all bits in DMACR1B, bits 11, 7, and 3 in DMABCR, and bit 5 in DMATCR.<br>0: Writes are disabled<br>1: Writes are enabled |
| 2      | WE1A     | 0             | R/W | Write Enable 1A<br>Enables or disables writes to all bits in DMACR1A, and bits 10, 6, and 2 in DMABCR.<br>0: Writes are disabled<br>1: Writes are enabled                  |
| 1      | WE0B     | 0             | R/W | Write Enable 0B<br>Enables or disables writes to all bits in DMACR0B, bits 9, 5, and 1 in DMABCR, and bit 4 in DMATCR.<br>0: Writes are disabled<br>1: Writes are enabled  |
| 0      | WE0A     | 0             | R/W | Write Enable 0A<br>Enables or disables writes to all bits in DMACR0A, and bits 8, 4, and 0 in DMABCR.<br>0: Writes are disabled<br>1: Writes are enabled                   |

Figure 7.2 shows the transfer areas for activating the DTC with a channel 0A transfer end interrupt request, and reactivating channel 0A. The address register and count register areas are set again during the first DTC transfer, then the control register area is set again during the second DTC chain transfer. When re-setting the control register area, perform masking by setting bits in DMAWER to prevent modification of the contents of other channels.

**Figure 7.2 Areas for Register Re-Setting by DTC (Channel 0A)**

Writes by the DTC to bits 15 to 12 (FAE and SAE) in DMABCR are invalid regardless of the DMAWER settings. These bits should be changed, if necessary, by CPU processing.

In writes by the DTC to bits 7 to 4 (DTE) in DMABCR, 1 can be written without first reading 0. To reactivate a channel set to full address mode, write 1 to both Write Enable A and Write Enable B for the channel to be reactivated.

MAR, IOAR, and ETCR can always be written to regardless of the DMAWER settings. When modifying these registers, the channel to be modified should be halted.

### 7.3.7 DMA Terminal Control Register (DMATCR)

DMATCR controls enabling or disabling of output from the DMAC transfer end pin. A port can be set for output automatically, and a transfer end signal output, by setting the appropriate bit. The TEND pin is available only for channel B in short address mode. Except for the block transfer mode, a transfer end signal asserts in the transfer cycle in which the transfer counter contents reaches 0 regardless of the activation source. In the block transfer mode, a transfer end signal asserts in the transfer cycle in which the block counter contents reaches 0.

| Bit    | Bit Name | Initial Value | R/W | Description   |
|--------|----------|---------------|-----|---|
| 7, 6   | —        | All 0         | —   | Reserved<br>These bits are always read as 0 and cannot be modified.   |
| 5      | TEE1     | 0             | R/W | Transfer End Enable 1<br>Enables or disables transfer end pin 1 ( $\overline{TEND1}$ ) output.<br>0: $\overline{TEND1}$ pin output disabled<br>1: $\overline{TEND1}$ pin output enabled |
| 4      | TEE0     | 0             | R/W | Transfer End Enable 0<br>Enables or disables transfer end pin 0 ( $\overline{TEND0}$ ) output.<br>0: $\overline{TEND0}$ pin output disabled<br>1: $\overline{TEND0}$ pin output enabled |
| 3 to 0 | —        | All 0         | —   | Reserved<br>These bits are always read as 0 and cannot be modified.   |

## 7.4 Activation Sources

DMAC activation sources consist of internal interrupt requests, external requests, and auto-requests. The DMAC activation sources that can be specified depend on the transfer mode and channel, as shown in table 7.3.

**Table 7.3 DMAC Activation Sources**

| Activation Source      |   | Short Address Mode    |                          | Full Address Mode |                           |
|------------------------|---|-----------------------|--------------------------|-------------------|---------------------------|
|                        |   | Channels<br>0A and 1A | Channels<br>0B and<br>1B | Normal<br>Mode    | Block<br>Transfer<br>Mode |
| Internal<br>interrupts | ADIO  | ○                     | ○                        | ×                 | ○                         |
|                        | TXI0  | ○                     | ○                        | ×                 | ○                         |
|                        | RXI0  | ○                     | ○                        | ×                 | ○                         |
|                        | TXI1  | ○                     | ○                        | ×                 | ○                         |
|                        | RXI1  | ○                     | ○                        | ×                 | ○                         |
|                        | TGI0A   | ○                     | ○                        | ×                 | ○                         |
|                        | TGI1A   | ○                     | ○                        | ×                 | ○                         |
|                        | TGI2A   | ○                     | ○                        | ×                 | ○                         |
|                        | TGI3A   | ○                     | ○                        | ×                 | ○                         |
|                        | TGI4A   | ○                     | ○                        | ×                 | ○                         |
|                        | TGI5A   | ○                     | ○                        | ×                 | ○                         |
| External<br>requests   | $\overline{\text{DREQ}}$ pin falling edge input | ×                     | ○                        | ○                 | ○                         |

### 7.4.1 Activation by Internal Interrupt Request

An interrupt request selected as a DMAC activation source can also simultaneously generate an interrupt request for the CPU or DTC. For details, see section 5, Interrupt Controller.

With activation by an internal interrupt request, the DMAC accepts the interrupt request independently of the interrupt controller. Consequently, interrupt controller priority settings are irrelevant.

If the DMAC is activated by a CPU interrupt source or an interrupt request that is not used as a DTC activation source ( $DTA = 1$ ), the interrupt request flag is cleared automatically by the DMA transfer. With ADI, TXI, and RXI interrupts, however, the interrupt source flag is not cleared unless the relevant register is accessed in a DMA transfer. If the same interrupt is used as an activation source for more than one channel, the interrupt request flag is cleared when the highest-priority channel is activated. Transfer requests for other channels are held pending in the DMAC, and activation is carried out in order of priority.

When  $DTE = 0$  after completion of a transfer, an interrupt request from the selected activation source is not sent to the DMAC, regardless of the DTA bit setting. In this case, the relevant interrupt request is sent to the CPU or DTC.

When an interrupt request signal for DMAC activation is also used for an interrupt request to the CPU or DTC activation ( $DTA = 0$ ), the interrupt request flag is not cleared by the DMAC.

## Activation by External Request

If an external request ( $\overline{\text{DREQ}}$  pin) is specified as a DMAC activation source, the relevant port should be set to input mode in advance\*. Level sensing or edge sensing can be used for external requests.

External request operation in normal mode of short address mode or full address mode is described below.

When edge sensing is selected, a byte or word is transferred each time a high-to-low transition is detected on the  $\overline{\text{DREQ}}$  pin. The next data transfer may not be performed if the next edge is input before data transfer is completed.

When level sensing is selected, the DMAC stands by for a transfer request while the  $\overline{\text{DREQ}}$  pin is held high. While the  $\overline{\text{DREQ}}$  pin is held low, transfers continue in succession, with the bus being released each time a byte or word is transferred. If the  $\overline{\text{DREQ}}$  pin goes high in the middle of a transfer, the transfer is interrupted and the DMAC stands by for a transfer request.

Note: \* If the relevant port is set as an output pin for another function, DMA transfers using the channel in question cannot be guaranteed.

### 7.4.2 Activation by Auto-Request

Auto-request is activated by register setting only, and transfer continues to the end. With auto-request activation, cycle steal mode or burst mode can be selected.

In cycle steal mode, the DMAC releases the bus to another bus master each time a byte or word is transferred. DMA and CPU cycles are usually repeated alternately. In burst mode, the DMAC keeps possession of the bus until the end of the transfer so that transfer is performed continuously.

## 7.5 Operation

### 7.5.1 Transfer Modes

Table 7.4 lists the DMAC transfer modes.

**Table 7.4 DMAC Transfer Modes**

| <b>Transfer Mode</b>   | <b>Transfer Source</b>  | <b>Remarks</b>  |
|--|---|---|
| Short address mode   | <ul style="list-style-type: none"> <li>• TPU channel 0 to 5 compare match/input capture A interrupt</li> <li>• SCI transmission complete interrupt</li> <li>• SCI reception complete interrupt</li> <li>• A/D converter conversion end interrupt</li> <li>• External request</li> </ul> | <ul style="list-style-type: none"> <li>• Up to 4 channels can operate independently</li> <li>• External request applies to channel B only</li> <li>• Single address mode applies to channel B only</li> </ul> |
| Dual address mode  |   |   |
| <ul style="list-style-type: none"> <li>• 1-byte or 1-word transfer for a single transfer request</li> <li>• Specify source and destination addresses to transfer data in two bus cycles.</li> </ul>  |   |   |
| (1) Sequential mode  |   |   |
| <ul style="list-style-type: none"> <li>• Memory address incremented or decremented by 1 or 2</li> <li>• Number of transfers: 1 to 65,536</li> </ul>  |   |   |
| (2) Idle mode  |   |   |
| <ul style="list-style-type: none"> <li>• Memory address fixed</li> <li>• Number of transfers: 1 to 65,536</li> </ul>   |   |   |
| (3) Repeat mode  |   |   |
| <ul style="list-style-type: none"> <li>• Memory address incremented or decremented by 1 or 2</li> <li>• Continues transfer after sending number of transfers (1 to 256) and restoring the initial value</li> </ul>   |   |   |
| Single address mode  | <ul style="list-style-type: none"> <li>• External request</li> </ul>  |   |
| <ul style="list-style-type: none"> <li>• 1-byte or 1-word transfer for a single transfer request</li> <li>• 1-bus cycle transfer by means of <math>\overline{\text{DACK}}</math> pin instead of using address for specifying I/O</li> <li>• Sequential mode, idle mode, or repeat mode can be specified</li> </ul> |   |   |

| Transfer Mode   | Transfer Source  | Remarks  |
|---|--|--|
| Full address mode   | Normal mode<br>(1) Auto-request <ul style="list-style-type: none"> <li>• Transfer request is internally held</li> <li>• Number of transfers (1 to 65,536) is continuously sent</li> <li>• Burst/cycle steal transfer can be selected</li> </ul> (2) External request <ul style="list-style-type: none"> <li>• 1-byte or 1-word transfer for a single transfer request</li> <li>• Number of transfers: 1 to 65,536</li> </ul> | <ul style="list-style-type: none"> <li>• Max. 2-channel operation, combining channels A and B</li> </ul> |
| Block transfer mode <ul style="list-style-type: none"> <li>• Transfer of 1-block, size selected for a single transfer request</li> <li>• Number of transfers: 1 to 65,536</li> <li>• Source or destination can be selected as block area</li> <li>• Block size: 1 to 256 bytes or word</li> </ul> | <ul style="list-style-type: none"> <li>• TPU channel 0 to 5 compare match/input capture A interrupt</li> <li>• SCI transmission complete interrupt</li> <li>• SCI reception complete interrupt</li> <li>• A/D converter conversion end interrupt</li> <li>• External request</li> </ul>  |  |

## 7.5.2 Sequential Mode

Sequential mode can be specified by clearing the RPE bit in DMACR to 0. In sequential mode, MAR is updated after each byte or word transfer in response to a single transfer request, and this is executed the number of times specified in ETCR. One address is specified by MAR, and the other by IOAR. The transfer direction can be specified by the DTDIR bit in DMACR.

Table 7.5 summarizes register functions in sequential mode.

**Table 7.5 Register Functions in Sequential Mode**

| Register  | Function                     |                              | Initial Setting  | Operation   |
|---|------------------------------|------------------------------|--|---|
|   | DTDIR = 0                    | DTDIR = 1                    |  |   |
|  | Source address register      | Destination address register | Start address of transfer destination or transfer source | Incremented/decrypted every transfer                              |
|  | Destination address register | Source address register      | Start address of transfer source or transfer destination | Fixed   |
|  | Transfer counter             |                              | Number of transfers                                      | Decrypted every transfer; transfer ends when count reaches H'0000 |

MAR specifies the start address of the transfer source or transfer destination as 24 bits. MAR is incremented or decremented by 1 or 2 each time a byte or word is transferred. IOAR specifies the lower 16 bits of the other address. The 8 bits above IOAR have a value of H'FF.

Figure 7.3 illustrates operation in sequential mode.

**Figure 7.3 Operation in Sequential Mode**

The number of transfers is specified as 16 bits in ETCR. ETCR is decremented by 1 each time a data transfer is executed, and when its value reaches H'0000, the DTE bit is cleared and data transfer ends. If the DTIE bit is set to 1 at this time, an interrupt request is sent to the CPU or DTC. The maximum number of transfers, when H'0000 is set in ETCR, is 65,536.

Transfer requests (activation sources) consist of A/D converter conversion end interrupts, external requests, SCI transmission complete and reception complete interrupts, and TPU channel 0 to 5 compare match/input capture A interrupts. External requests can only be specified for channel B.

Figure 7.4 shows an example of the setting procedure for sequential mode.

**Figure 7.4 Example of Sequential Mode Setting Procedure**

### 7.5.3 Idle Mode

Idle mode can be specified by setting the RPE bit in DMACR and DTIE bit in DMABCRL to 1. In idle mode, one byte or word is transferred in response to a single transfer request, and this is executed the number of times specified in ETCR. One address is specified by MAR, and the other by IOAR. The transfer direction can be specified by the DTDIR bit in DMACR. Table 7.6 summarizes register functions in idle mode.

**Table 7.6 Register Functions in Idle Mode**

| Register  | Function                     |                              | Initial Setting  | Operation   |
|---|------------------------------|------------------------------|--|---|
|   | DTDIR = 0                    | DTDIR = 1                    |  |   |
|  | Source address register      | Destination address register | Start address of transfer destination or transfer source | Fixed   |
|  | Destination address register | Source address register      | Start address of transfer source or transfer destination | Fixed   |
|  | Transfer counter             |                              | Number of transfers                                      | Decrement every transfer; transfer ends when count reaches H'0000 |

MAR specifies the start address of the transfer source or transfer destination as 24 bits. MAR is neither incremented nor decremented by a data transfer. IOAR specifies the lower 16 bits of the other address. The upper 8 bits of IOAR have a value of H'FF.

Figure 7.5 illustrates operation in idle mode.

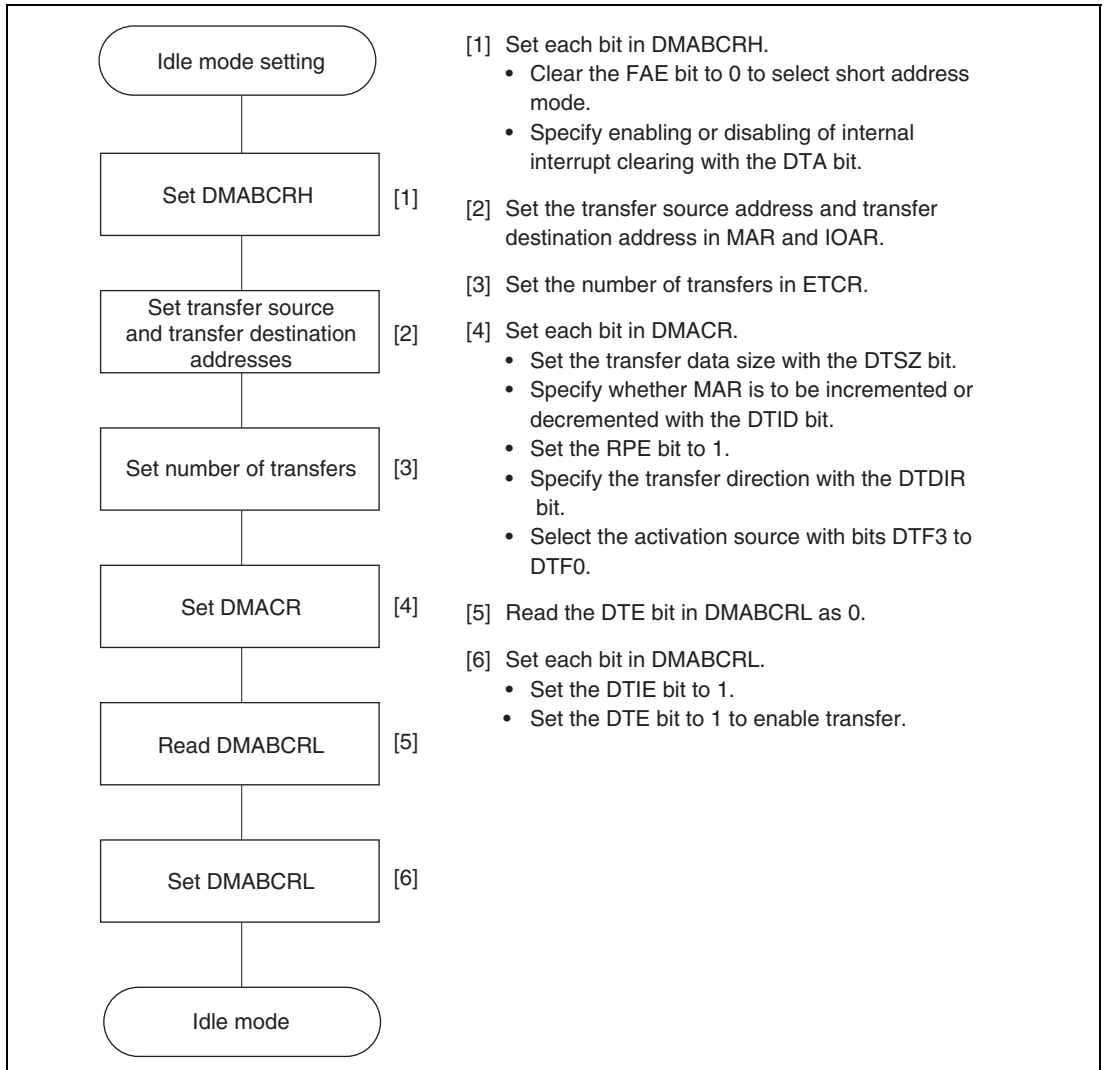

**Figure 7.5 Operation in Idle Mode**

The number of transfers is specified as 16 bits in ETCR. ETCR is decremented by 1 each time a transfer is executed, and when its value reaches H'0000, the DTE bit is cleared and data transfer ends. If the DTIE bit is set to 1 at this time, an interrupt request is sent to the CPU or DTC. The maximum number of transfers, when H'0000 is set in ETCR, is 65,536.

Transfer requests (activation sources) consist of A/D converter conversion end interrupts, external requests, SCI transmission complete and reception complete interrupts, and TPU channel 0 to 5 compare match/input capture A interrupts. External requests can only be specified for channel B.

Figure 7.6 shows an example of the setting procedure for idle mode.

**Figure 7.6 Example of Idle Mode Setting Procedure**

### 7.5.4 Repeat Mode

Repeat mode can be specified by setting the RPE bit in DMACR to 1, and clearing the DTIE bit in DMABCRL to 0. In repeat mode, MAR is updated after each byte or word transfer in response to a single transfer request, and this is executed the number of times specified in ETCRL. On completion of the specified number of transfers, MAR and ETCRL are automatically restored to their original settings and operation continues. One address is specified by MAR, and the other by IOAR. The transfer direction can be specified by the DTDIR bit in DMACR. Table 7.7 summarizes register functions in repeat mode.

**Table 7.7 Register Functions in Repeat Mode**

| Register  | Function                     |                              | Initial Setting  | Operation   |
|---|------------------------------|------------------------------|--|---|
|   | DTDIR = 0                    | DTDIR = 1                    |  |   |
|    | Source address register      | Destination address register | Start address of transfer destination or transfer source | Incremented/decremented every transfer. Initial setting is restored when the value reaches H'0000 |
|    | Destination address register | Source address register      | Start address of transfer source or transfer destination | Fixed   |
|    | Holds number of transfers    |                              | Number of transfers                                      | Fixed   |
| ↓   |                              |                              |  |   |
|  | Transfer counter             |                              | Number of transfers                                      | Decrement every transfer. Loaded with ETCRH value when the value reaches H'00                     |

MAR specifies the start address of the transfer source or transfer destination as 24 bits. MAR is incremented or decremented by 1 or 2 each time a byte or word is transferred. IOAR specifies the lower 16 bits of the other address. The upper 8 bits of IOAR have a value of H'FF. The number of transfers is specified as 8 bits by ETCRH and ETCRL. The maximum number of transfers, when H'00 is set in both ETCRH and ETCRL, is 256.

In repeat mode, ETCRL functions as the transfer counter, and ETCRH is used to hold the number of transfers. ETCRL is decremented by 1 each time a data transfer is executed, and when its value reaches H'00, it is loaded with the value in ETCRH. At the same time, the value set in MAR is restored in accordance with the values of the DTSZ and DTID bits in DMACR. The MAR restoration operation is as shown below.

$$\text{MAR} = \text{MAR} - (-1)^{\text{DTID}} \cdot 2^{\text{DTSZ}} \cdot \text{ETCRH}$$

The same value should be set in ETCRH and ETCRL.

In repeat mode, operation continues until the DTE bit in DMABCRL is cleared. To end the transfer operation, therefore, the DTE bit should be cleared to 0. A transfer end interrupt request is not sent to the CPU or DTC. By setting the DTE bit to 1 again after it has been cleared, the operation can be restarted from the transfer after that terminated when the DTE bit was cleared.

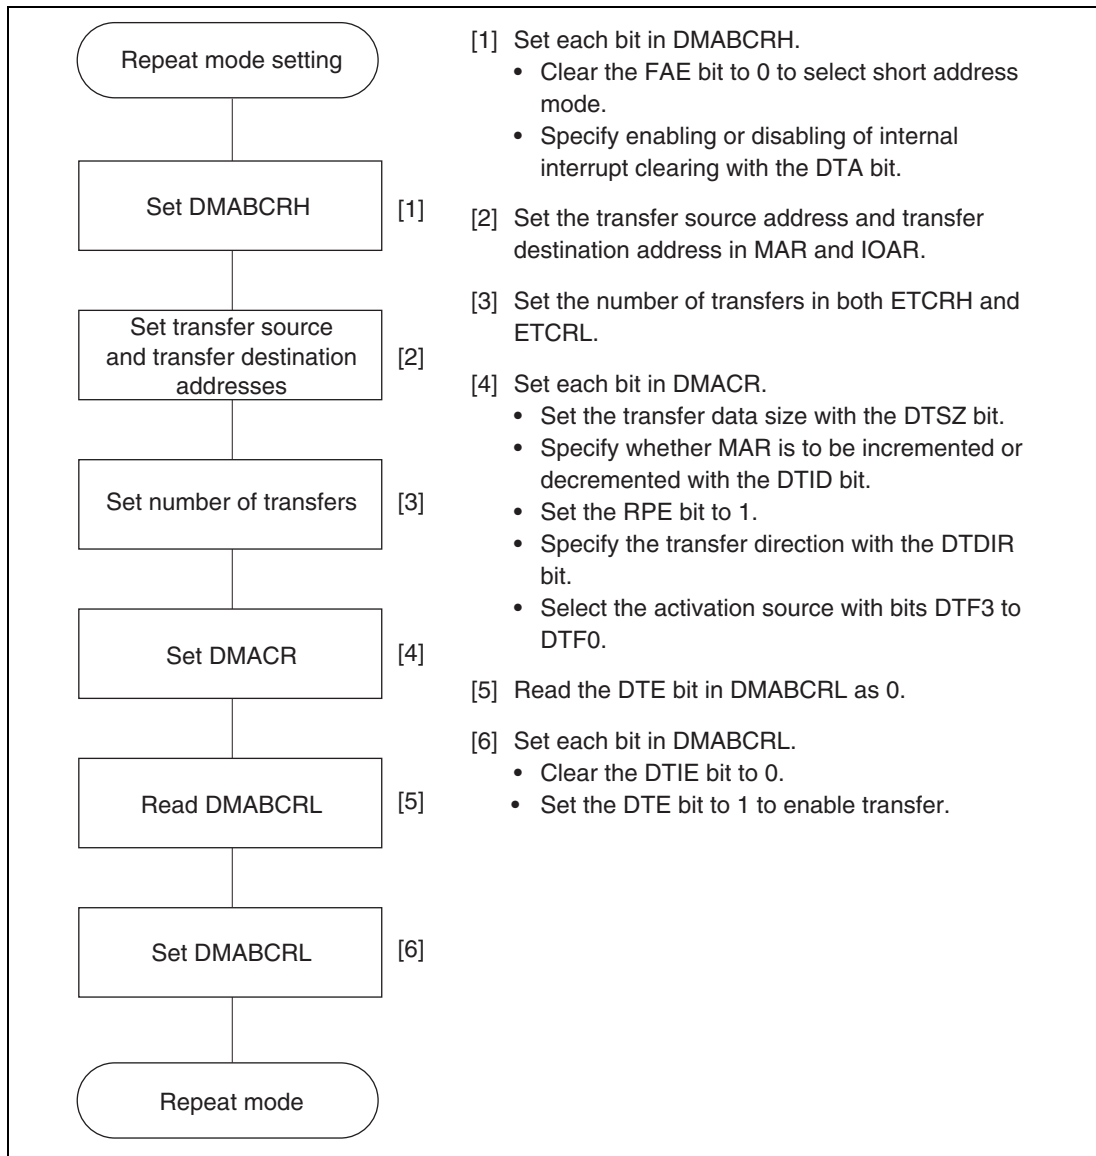

Figure 7.7 illustrates operation in repeat mode.

**Figure 7.7 Operation in Repeat mode**

Transfer requests (activation sources) consist of A/D converter conversion end interrupts, external requests, SCI transmission complete and reception complete interrupts, and TPU channel 0 to 5 compare match/input capture A interrupts. External requests can only be specified for channel B.

Figure 7.8 shows an example of the setting procedure for repeat mode.

**Figure 7.8 Example of Repeat Mode Setting Procedure**

### 7.5.5 Single Address Mode

Single address mode can only be specified for channel B. This mode can be specified by setting the SAE bit in DMABCRH to 1 in short address mode.

One address is specified by MAR, and the other is set automatically to the data transfer acknowledge pin ( $\overline{\text{DACK}}$ ). The transfer direction can be specified by the DTDIR bit in DMACR. Table 7.8 summarizes register functions in single address mode.

**Table 7.8 Register Functions in Single Address Mode**

| Register  | Function                |                              | Initial Setting  | Operation  |
|---|-------------------------|------------------------------|--|--|
|   | DTDIR = 0               | DTDIR = 1                    |  |  |
|  | Source address register | Destination address register | Start address of transfer destination or transfer source   | See sections 7.5.2, Sequential Mode, 7.5.3, Idle Mode, and 7.5.4, Repeat Mode. |
| $\overline{\text{DACK}}$ pin  | Write strobe            | Read strobe                  | (Set automatically by SAE bit in DMABCRH; IOAR is invalid) | Strobe for external device   |
|  | Transfer counter        |                              | Number of transfers  | See sections 7.5.2, Sequential Mode, 7.5.3, Idle Mode, and 7.5.4, Repeat Mode. |

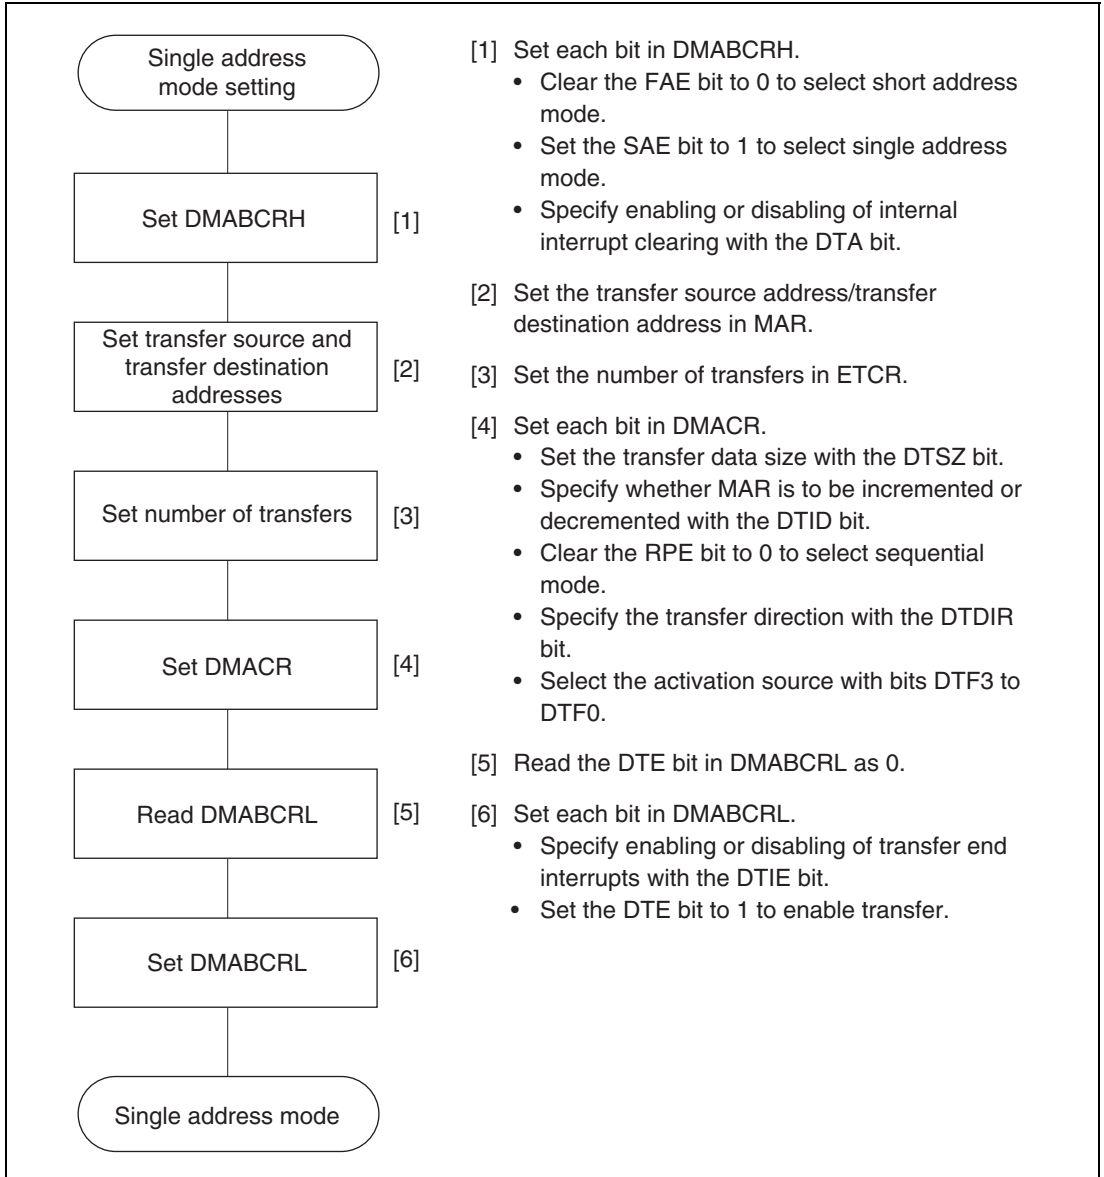

MAR specifies the start address of the transfer source or transfer destination as 24 bits. IOAR is invalid; in its place the strobe for external devices ( $\overline{\text{DACK}}$ ) is output.

Figure 7.9 illustrates operation in single address mode (when sequential mode is specified).

**Figure 7.9 Operation in Single Address Mode (When Sequential Mode Is Specified)**

Figure 7.10 shows an example of the setting procedure for single address mode (when sequential mode is specified).

**Figure 7.10 Example of Single Address Mode Setting Procedure  
(When Sequential Mode Is Specified)**

## 7.5.6 Normal Mode

In normal mode, transfer is performed with channels A and B used in combination. Normal mode can be specified by setting the FAE bit in DMABCRH to 1 and clearing the BLKE bit in DMACRA to 0. In normal mode, MAR is updated after data transfer of a byte or word in response to a single transfer request, and this is executed the number of times specified in ETCRA. The transfer source is specified by MARA, and the transfer destination by MARB. Table 7.9 summarizes register functions in normal mode.

**Table 7.9 Register Functions in Normal Mode**

| Register  | Function                     | Initial Setting                       | Operation   |
|---|------------------------------|---------------------------------------|---|
|  | Source address register      | Start address of transfer source      | Incremented/decremented every transfer, or fixed                  |
|  | Destination address register | Start address of transfer destination | Incremented/decremented every transfer, or fixed                  |
|  | Transfer counter             | Number of transfers                   | Decrement every transfer; transfer ends when count reaches H'0000 |

MARA and MARB specify the start addresses of the transfer source and transfer destination, respectively, as 24 bits. MAR can be incremented or decremented by 1 or 2 each time a byte or word is transferred, or can be fixed. Incrementing, decrementing, or holding a fixed value can be set separately for MARA and MARB.

The number of transfers is specified by ETCRA as 16 bits. ETCRA is decremented by 1 each time a transfer is performed, and when its value reaches H'0000 the DTE bit in DMABCRL is cleared and transfer ends. If the DTIE bit in DMABCRL is set to 1 at this time, an interrupt request is sent to the CPU or DTC. The maximum number of transfers, when H'0000 is set in ETCRA, is 65,536.

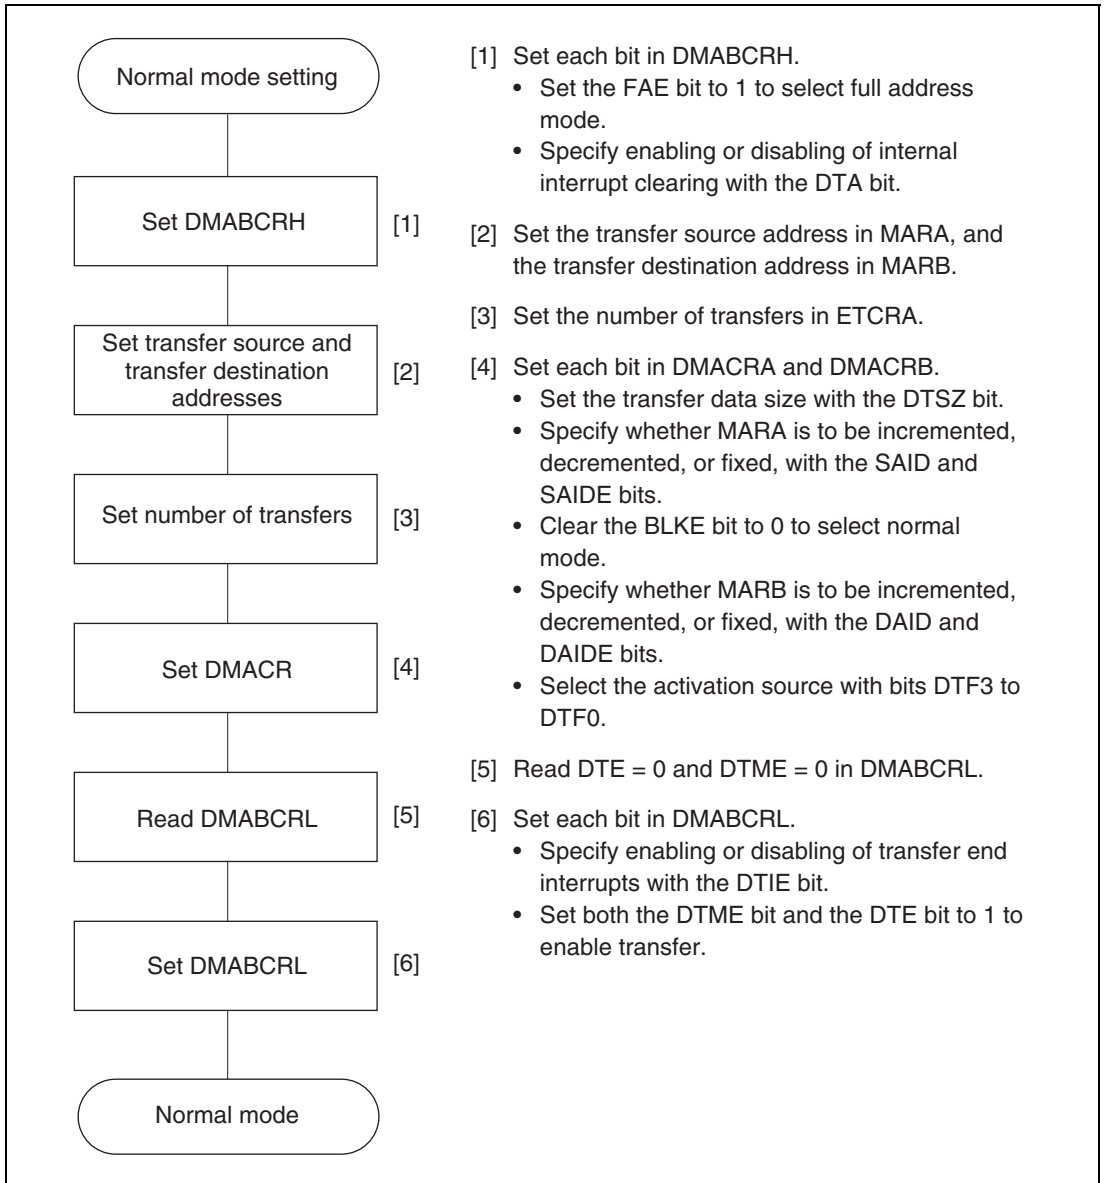

Figure 7.11 illustrates operation in normal mode.

**Figure 7.11 Operation in Normal Mode**

Transfer requests (activation sources) are external requests and auto-requests. With auto-requests, the DMAC is only activated by register setting, and the specified number of transfers are performed automatically. With auto-requests, cycle steal mode or burst mode can be selected. In cycle steal mode, the bus is released to another bus master each time a transfer is performed. In burst mode, the bus is held continuously until transfer ends.

Figure 7.12 shows an example of the setting procedure for normal mode.

**Figure 7.12 Example of Normal Mode Setting Procedure**

### 7.5.7 Block Transfer Mode

In block transfer mode, data transfer is performed with channels A and B used in combination. Block transfer mode can be specified by setting the FAE bit in DMABCRH and the BLKE bit in DMACRA to 1. In block transfer mode, a data transfer of the specified block size is carried out in response to a single transfer request, and this is executed for the number of times specified in ETCRB. The transfer source is specified by MARA, and the transfer destination by MARB. Either the transfer source or the transfer destination can be selected as a block area (an area composed of a number of bytes or words). Table 7.10 summarizes register functions in block transfer mode.

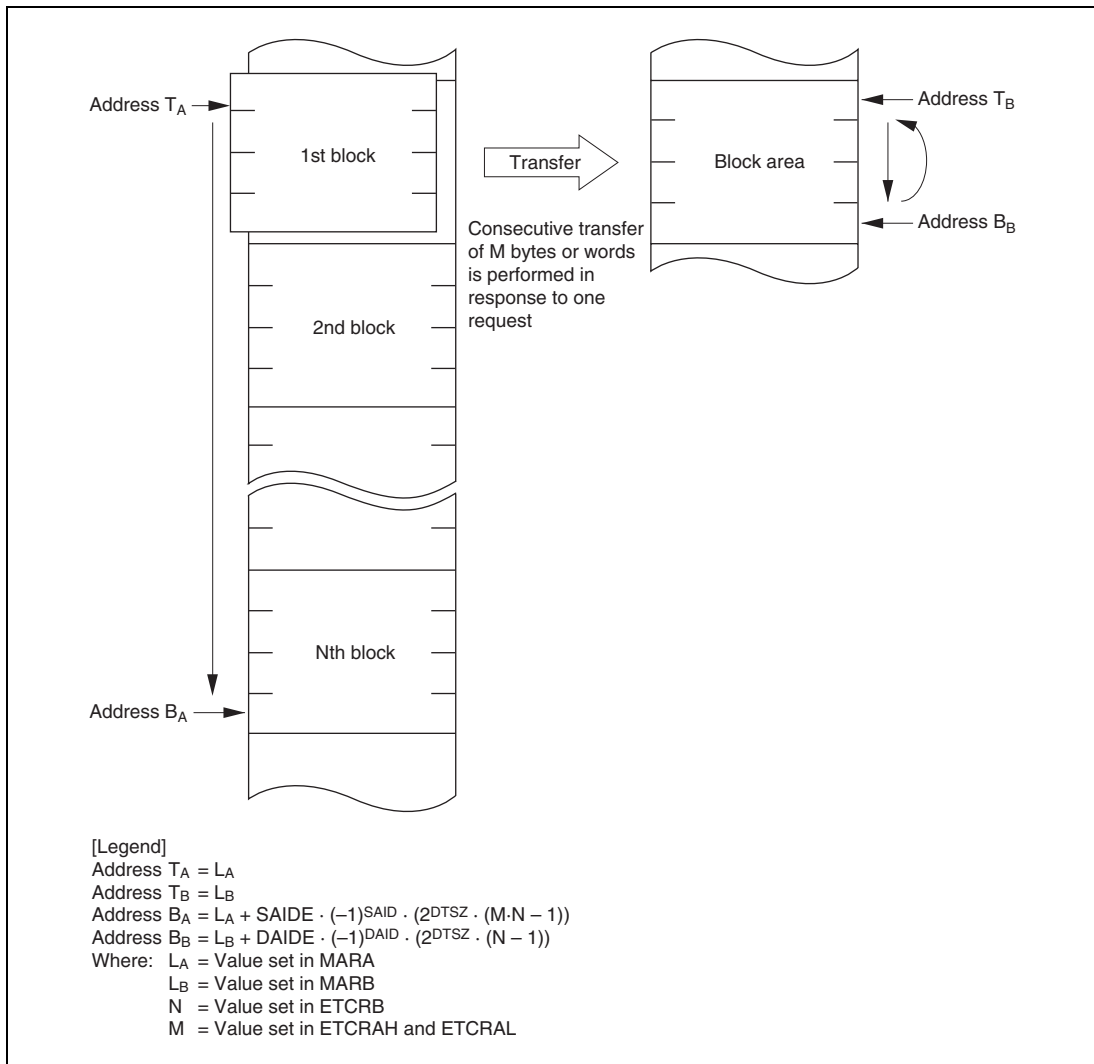

**Table 7.10 Register Functions in Block Transfer Mode**

| Register  | Function                     | Initial Setting                       | Operation   |
|---|------------------------------|---------------------------------------|---|
|  | Source address register      | Start address of transfer source      | Incremented/decremented every transfer, or fixed                        |
|  | Destination address register | Start address of transfer destination | Incremented/decremented every transfer, or fixed                        |
|  | Holds block size             | Block size                            | Fixed   |
|  | Block size counter           | Block size                            | Decrement every transfer; ETCRAH value copied when count reaches H'00   |
|  | Block transfer counter       | Number of block transfers             | Decrement every block transfer; transfer ends when count reaches H'0000 |

MARA and MARB specify the start addresses of the transfer source and transfer destination, respectively, as 24 bits. MAR can be incremented or decremented by 1 or 2 each time a byte or word is transferred, or can be fixed. Incrementing, decrementing, or holding a fixed value can be set separately for MARA and MARB. Whether a block is to be designated for MARA or for MARB is specified by the BLKDIR bit in DMACRA.

To specify the number of transfers, if M is the size of one block (where M = 1 to 256) and N transfers are to be performed (where N = 1 to 65,536), M is set in both ETCRAH and ETCRAL, and N in ETCRB.

Figure 7.13 illustrates operation in block transfer mode when MARB is designated as a block area.

**Figure 7.13 Operation in Block Transfer Mode (BLKDIR = 0)**

Figure 7.14 illustrates operation in block transfer mode when MARA is designated as a block area.

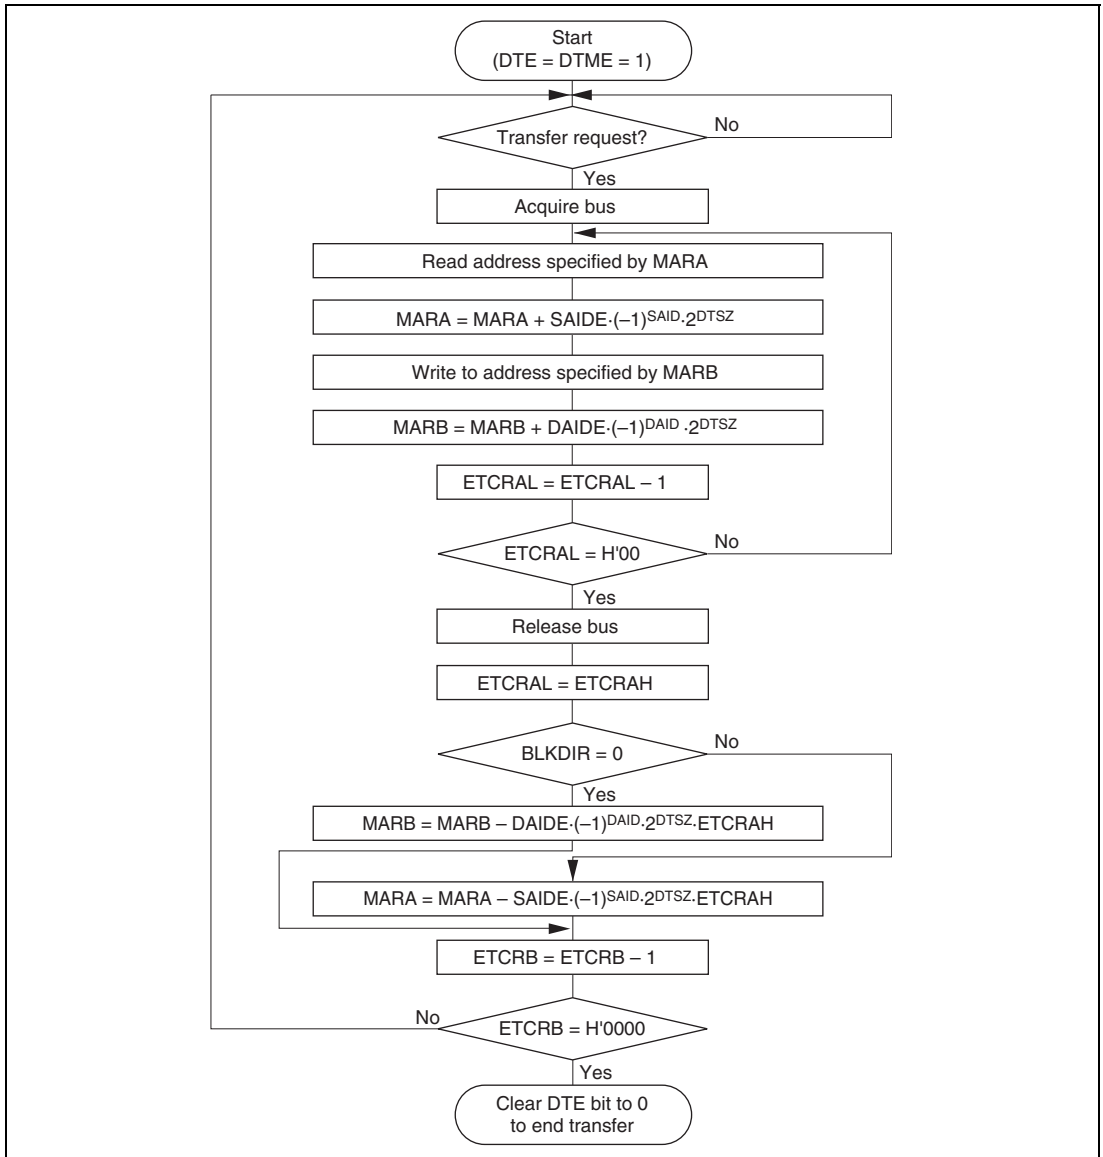

**Figure 7.14 Operation in Block Transfer Mode (BLKDIR = 1)**

ETCRAL is decremented by 1 each time a byte or word transfer is performed. In response to a single transfer request, burst transfer is performed until the value in ETCRAL reaches H'00. ETCRAL is then loaded with the value in ETCRAH. At this time, the value in the MAR register for which a block designation has been given by the BLKDIR bit in DMACRA is restored in accordance with the DTSZ, SAID/DAID, and SAIDE/DAIDE bits in DMACR.

ETCRB is decremented by 1 after every block transfer, and when the count reaches H'0000 the DTE bit in DMABCRL is cleared and transfer ends. If the DTIE bit in DMABCRL is set to 1 at this point, an interrupt request is sent to the CPU or DTC.

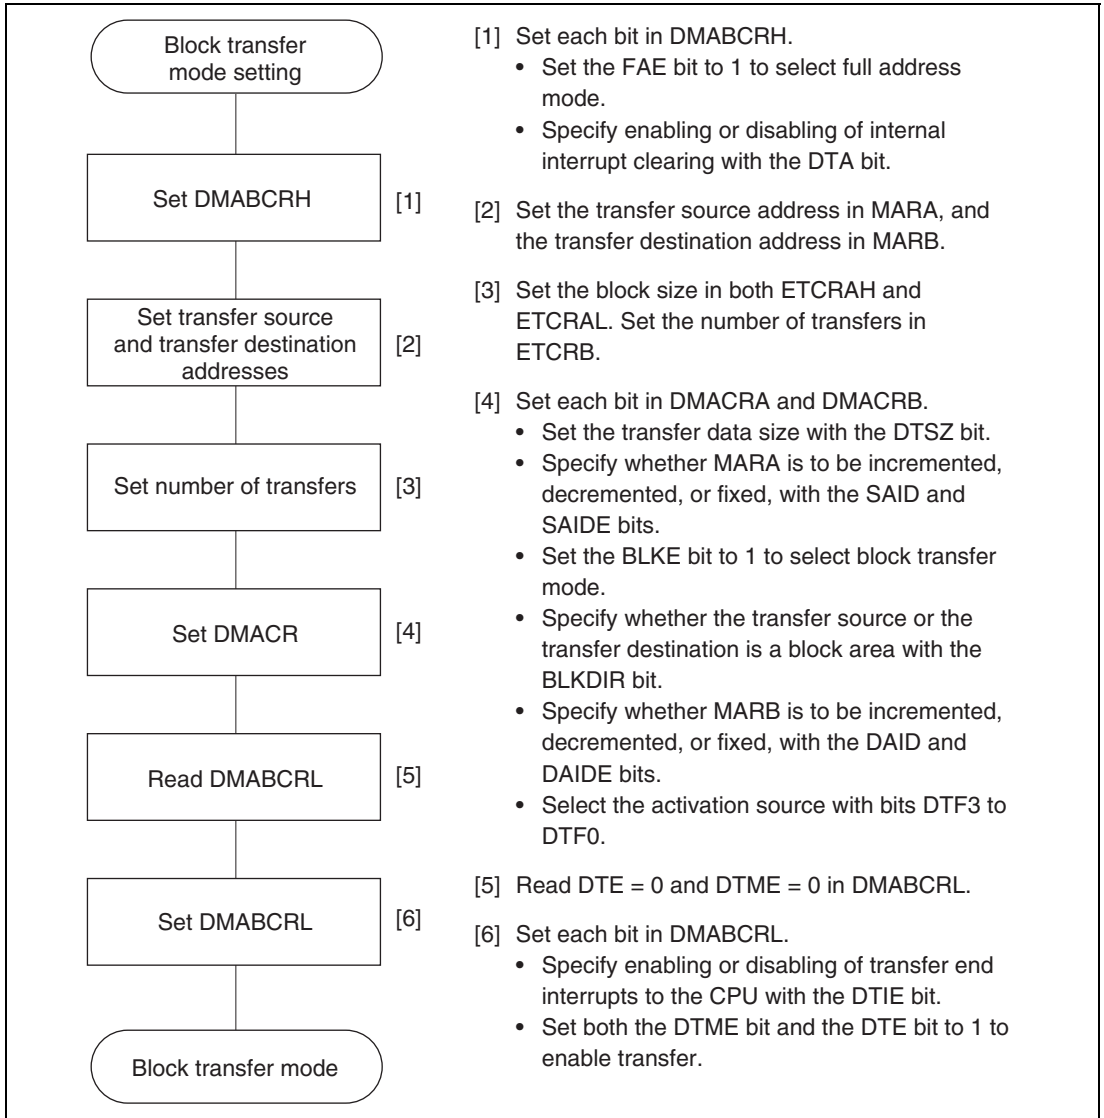

Figure 7.15 shows the operation flow in block transfer mode.

**Figure 7.15 Operation Flow in Block Transfer Mode**

Transfer requests (activation sources) consist of A/D converter conversion end interrupts, external requests, SCI transmission complete and reception complete interrupts, and TPU channel 0 to 5 compare match/input capture A interrupts.

Figure 7.16 shows an example of the setting procedure for block transfer mode.

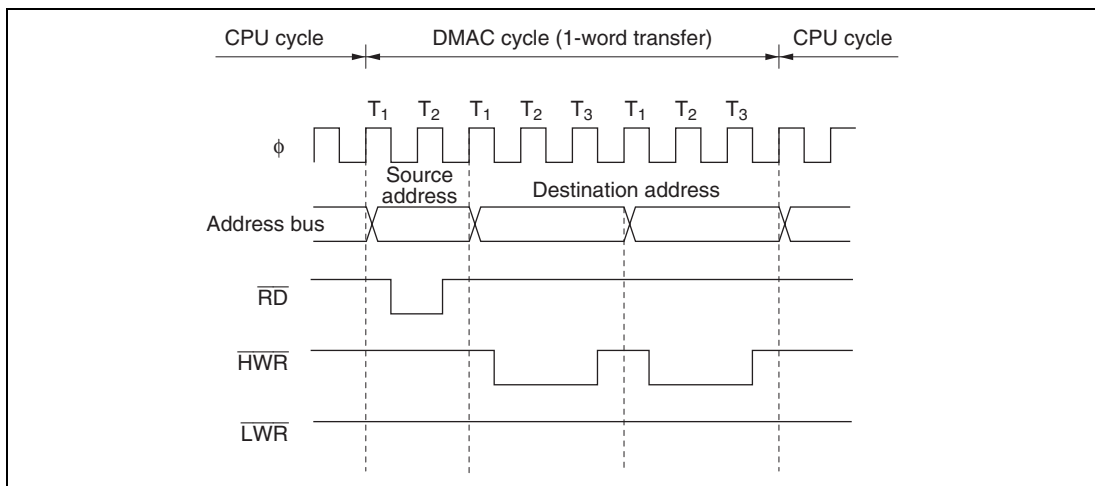

**Figure 7.16 Example of Block Transfer Mode Setting Procedure**

### 7.5.8 Basic Bus Cycles

An example of the basic DMAC bus cycle timing is shown in figure 7.17. In this example, word-size transfer is performed from 16-bit, 2-state access space to 8-bit, 3-state access space. When the bus is transferred from the CPU to the DMAC, a source address read and destination address write are performed. The bus is not released in response to another bus request, etc., between these read and write operations. As like CPU cycles, DMA cycles conform to the bus controller settings.

The address is not output to the external address bus in an access to on-chip memory or an internal I/O register.

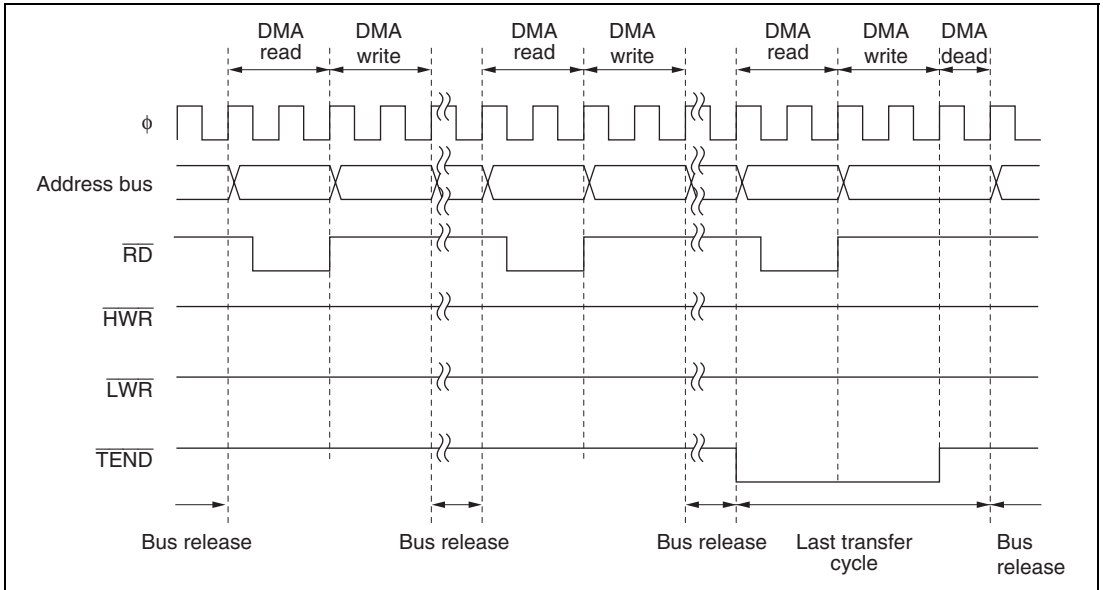

**Figure 7.17 Example of DMA Transfer Bus Timing**

## 7.5.9 DMA Transfer (Dual Address Mode) Bus Cycles

### (1) Short Address Mode

Figure 7.18 shows a transfer example in which  $\overline{\text{TEND}}$  output is enabled and byte-size short address mode transfer (sequential/idle/repeat mode) is performed from external 8-bit, 2-state access space to internal I/O space.

**Figure 7.18 Example of Short Address Mode Transfer**

A byte or word transfer is performed for a single transfer request, and after the transfer, the bus is released. While the bus is released, one or more bus cycles are executed by the CPU or DTC.

In the transfer end cycle (the cycle in which the transfer counter reaches 0), a one-state DMA dead cycle is inserted after the DMA write cycle.

In repeat mode, when  $\overline{\text{TEND}}$  output is enabled,  $\overline{\text{TEND}}$  output goes low in the transfer end cycle.

## (2) Full Address Mode (Cycle Steal Mode)

Figure 7.19 shows a transfer example in which  $\overline{\text{TEND}}$  output is enabled and word-size full address mode transfer (cycle steal mode) is performed from external 16-bit, 2-state access space to external 16-bit, 2-state access space.

**Figure 7.19 Example of Full Address Mode Transfer (Cycle Steal)**

A byte or word transfer is performed for a single transfer request, and after the transfer, the bus is released. While the bus is released, one bus cycle is executed by the CPU or DTC.

In the transfer end cycle (the cycle in which the transfer counter reaches 0), a one-state DMA dead cycle is inserted after the DMA write cycle.

### (3) Full Address Mode (Burst Mode)

Figure 7.20 shows a transfer example in which  $\overline{\text{TEND}}$  output is enabled and word-size full address mode transfer (burst mode) is performed from external 16-bit, 2-state access space to external 16-bit, 2-state access space.

**Figure 7.20 Example of Full Address Mode Transfer (Burst Mode)**

In burst mode, one-byte or one-word transfers are executed consecutively until transfer ends.

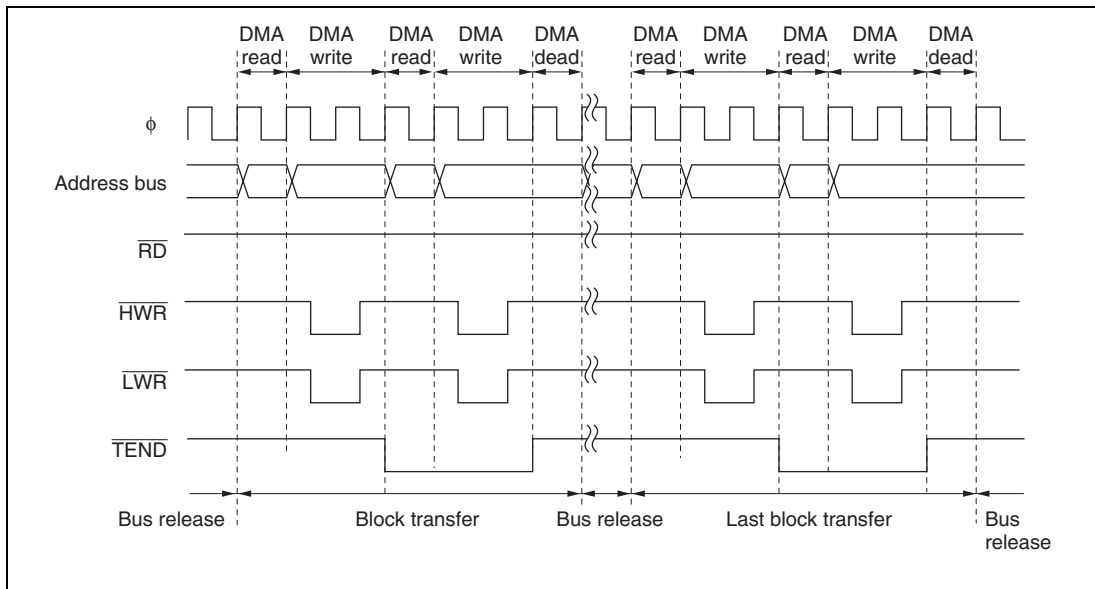

In the transfer end cycle (the cycle in which the transfer counter reaches 0), a one-state DMA dead cycle is inserted after the DMA write cycle.

If a request from another higher-priority channel is generated after burst transfer starts, that channel has to wait until the burst transfer ends.

If an NMI interrupt is generated while a channel designated for burst transfer is in the transfer enabled state, the DTME bit in DMABCRL is cleared and the channel is placed in the transfer disabled state. If burst transfer has already been activated inside the DMAC, the bus is released on completion of a one-byte or one-word transfer within the burst transfer, and burst transfer is suspended. If the last transfer cycle of the burst transfer has already been activated inside the DMAC, execution continues to the end of the transfer even if the DTME bit is cleared.

#### (4) Full Address Mode (Block Transfer Mode)

Figure 7.21 shows a transfer example in which  $\overline{\text{TEND}}$  output is enabled and word-size full address mode transfer (block transfer mode) is performed from internal 16-bit, 1-state access space to external 16-bit, 2-state access space.

**Figure 7.21 Example of Full Address Mode Transfer (Block Transfer Mode)**

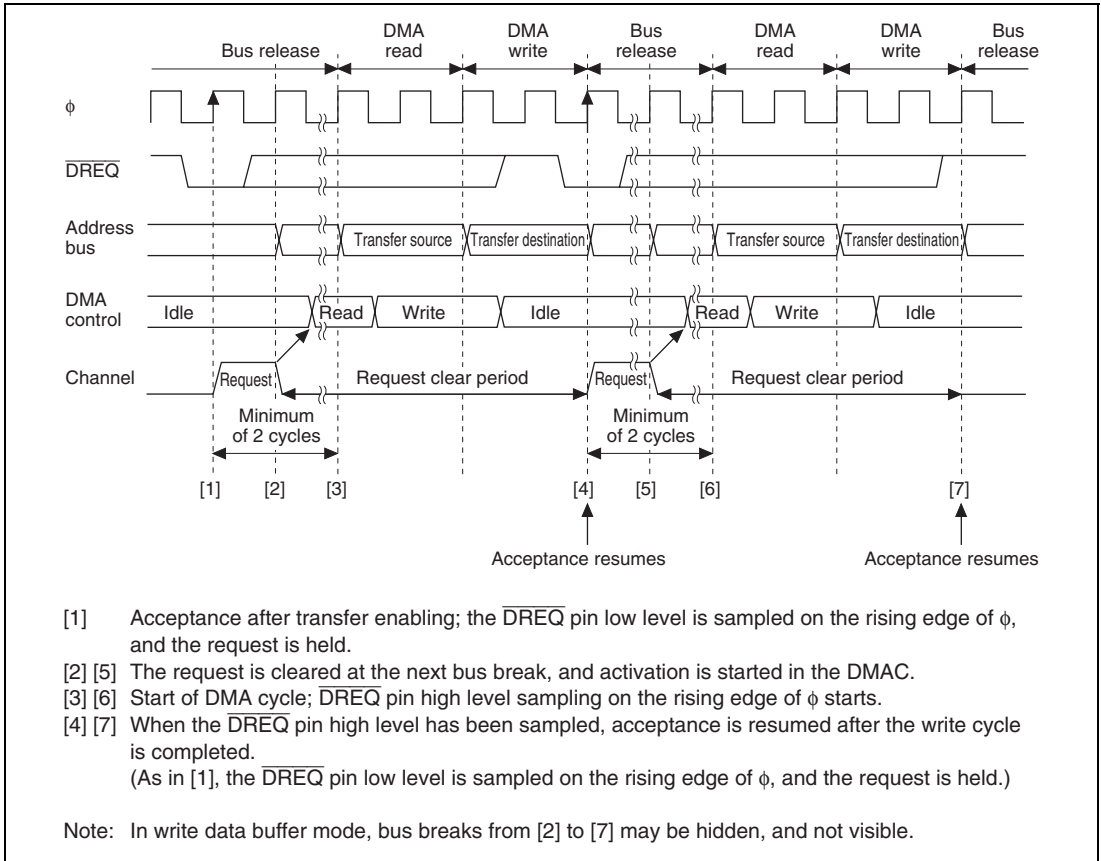

A one-block transfer is performed for a single transfer request, and after the transfer the bus is released. While the bus is released, one or more bus cycles are executed by the CPU or DTC.

In the transfer end cycle of each block (the cycle in which the transfer counter reaches 0), a one-state DMA dead cycle is inserted after the DMA write cycle. Even if an NMI interrupt is generated during data transfer, block transfer operation is not affected until data transfer for one block has ended.

### (5) $\overline{\text{DREQ}}$ Pin Falling Edge Activation Timing

Set the DTA bit in DMABCRH to 1 for the channel for which the  $\overline{\text{DREQ}}$  pin is selected.

Figure 7.22 shows an example of normal mode transfer activated by the  $\overline{\text{DREQ}}$  pin falling edge.

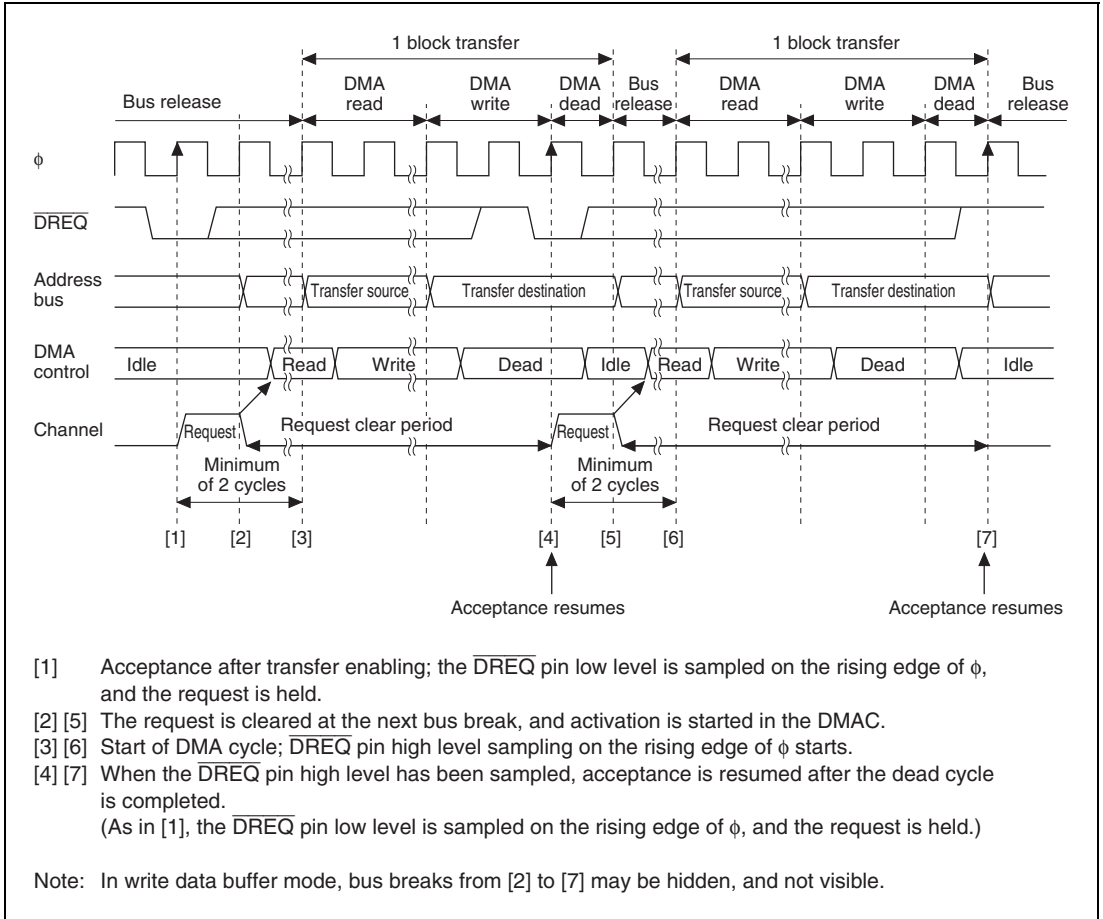

**Figure 7.22 Example of  $\overline{\text{DREQ}}$  Pin Falling Edge Activated Normal Mode Transfer**

$\overline{\text{DREQ}}$  pin sampling is performed every cycle, with the rising edge of the next  $\phi$  cycle after the end of the DMABCR write cycle for setting the transfer enabled state as the starting point.

When the  $\overline{\text{DREQ}}$  pin low level is sampled while acceptance by means of the  $\overline{\text{DREQ}}$  pin is possible, the request is held in the DMAC. Then, when activation is initiated in the DMAC, the request is cleared, and  $\overline{\text{DREQ}}$  pin high level sampling for edge detection is started. If  $\overline{\text{DREQ}}$  pin high level sampling has been completed by the time the DMA write cycle ends, acceptance resumes after the end of the write cycle,  $\overline{\text{DREQ}}$  pin low level sampling is performed again, and this operation is repeated until the transfer ends.

Figure 7.23 shows an example of block transfer mode transfer activated by the  $\overline{\text{DREQ}}$  pin falling edge.

**Figure 7.23 Example of  $\overline{\text{DREQ}}$  Pin Falling Edge Activated Block Transfer Mode Transfer**

$\overline{\text{DREQ}}$  pin sampling is performed every cycle, with the rising edge of the next  $\phi$  cycle after the end of the DMABCR write cycle for setting the transfer enabled state as the starting point.

When the  $\overline{\text{DREQ}}$  pin low level is sampled while acceptance by means of the  $\overline{\text{DREQ}}$  pin is possible, the request is held in the DMAC. Then, when activation is initiated in the DMAC, the request is cleared, and  $\overline{\text{DREQ}}$  pin high level sampling for edge detection is started. If  $\overline{\text{DREQ}}$  pin high level sampling has been completed by the time the DMA dead cycle ends, acceptance resumes after the end of the dead cycle,  $\overline{\text{DREQ}}$  pin low level sampling is performed again, and this operation is repeated until the transfer ends.

## (6) $\overline{\text{DREQ}}$ Pin Low Level Activation Timing (Normal Mode)

Set the DTA bit in DMABCRH to 1 for the channel for which the  $\overline{\text{DREQ}}$  pin is selected.

Figure 7.24 shows an example of normal mode transfer activated by the  $\overline{\text{DREQ}}$  pin low level.

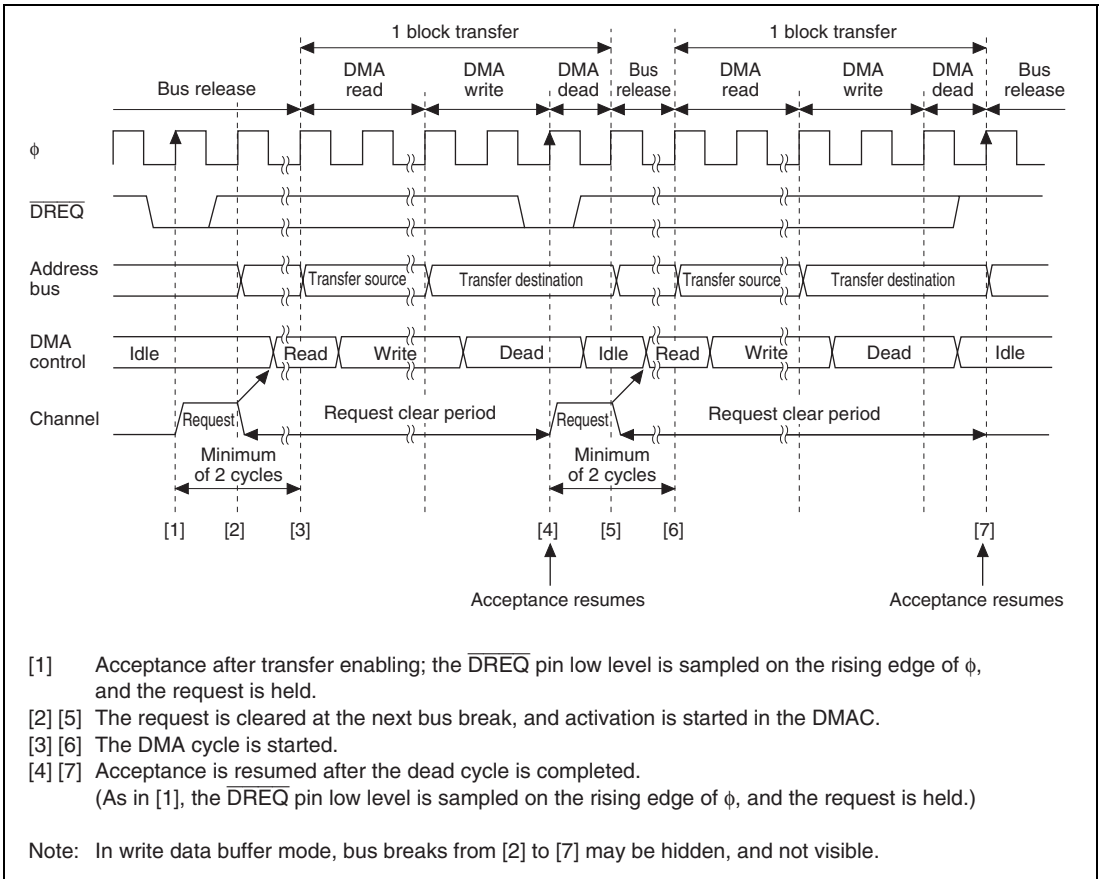

**Figure 7.24 Example of  $\overline{\text{DREQ}}$  Pin Low Level Activated Normal Mode Transfer**

$\overline{\text{DREQ}}$  pin sampling is performed every cycle, with the rising edge of the next  $\phi$  cycle after the end of the DMABCR write cycle for setting the transfer enabled state as the starting point.

When the  $\overline{\text{DREQ}}$  pin low level is sampled while acceptance by means of the  $\overline{\text{DREQ}}$  pin is possible, the request is held in the DMAC. Then, when activation is initiated in the DMAC, the request is cleared. After the end of the write cycle, acceptance resumes,  $\overline{\text{DREQ}}$  pin low level sampling is performed again, and this operation is repeated until the transfer ends.

Figure 7.25 shows an example of block transfer mode transfer activated by  $\overline{\text{DREQ}}$  pin low level.

**Figure 7.25 Example of  $\overline{\text{DREQ}}$  Pin Low Level Activated Block Transfer Mode Transfer**

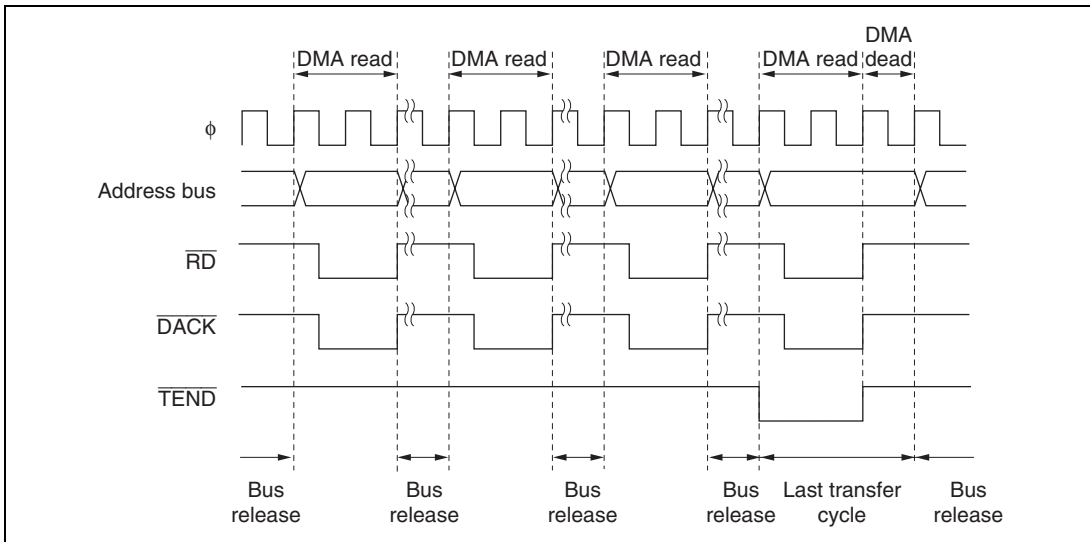

$\overline{\text{DREQ}}$  pin sampling is performed every cycle, with the rising edge of the next  $\phi$  cycle after the end of the DMABCR write cycle for setting the transfer enabled state as the starting point.

When the  $\overline{\text{DREQ}}$  pin low level is sampled while acceptance by means of the  $\overline{\text{DREQ}}$  pin is possible, the request is held in the DMAC. Then, when activation is initiated in the DMAC, the request is cleared. After the end of the dead cycle, acceptance resumes,  $\overline{\text{DREQ}}$  pin low level sampling is performed again, and this operation is repeated until the transfer ends.

### 7.5.10 DMA Transfer (Single Address Mode) Bus Cycles

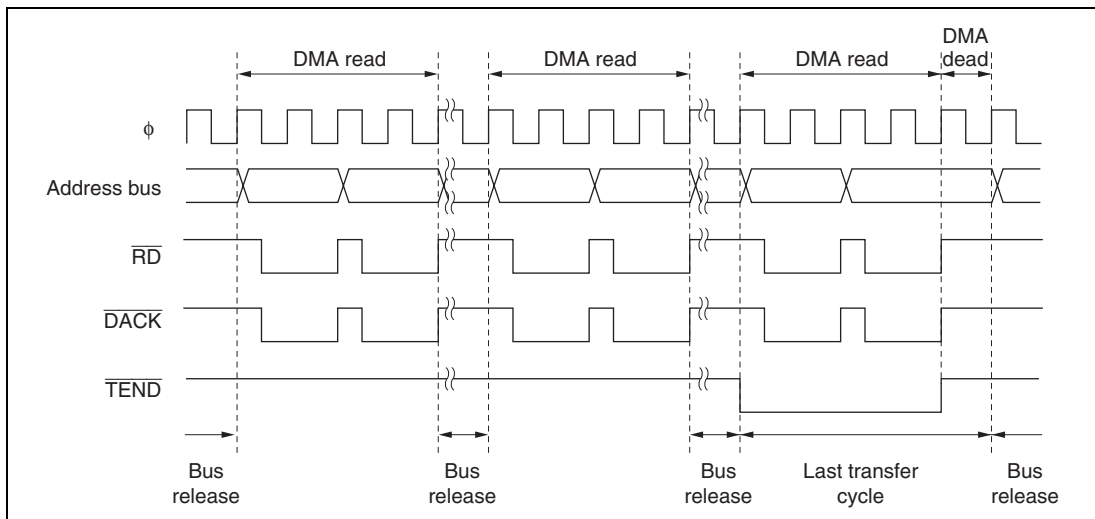

#### (1) Single Address Mode (Read)

Figure 7.26 shows a transfer example in which  $\overline{TEND}$  output is enabled and byte-size single address mode transfer (read) is performed from external 8-bit, 2-state access space to an external device.

**Figure 7.26 Example of Single Address Mode Transfer (Byte Read)**

Figure 7.27 shows a transfer example in which  $\overline{\text{TEND}}$  output is enabled and word-size single address mode transfer (read) is performed from external 8-bit, 2-state access space to an external device.

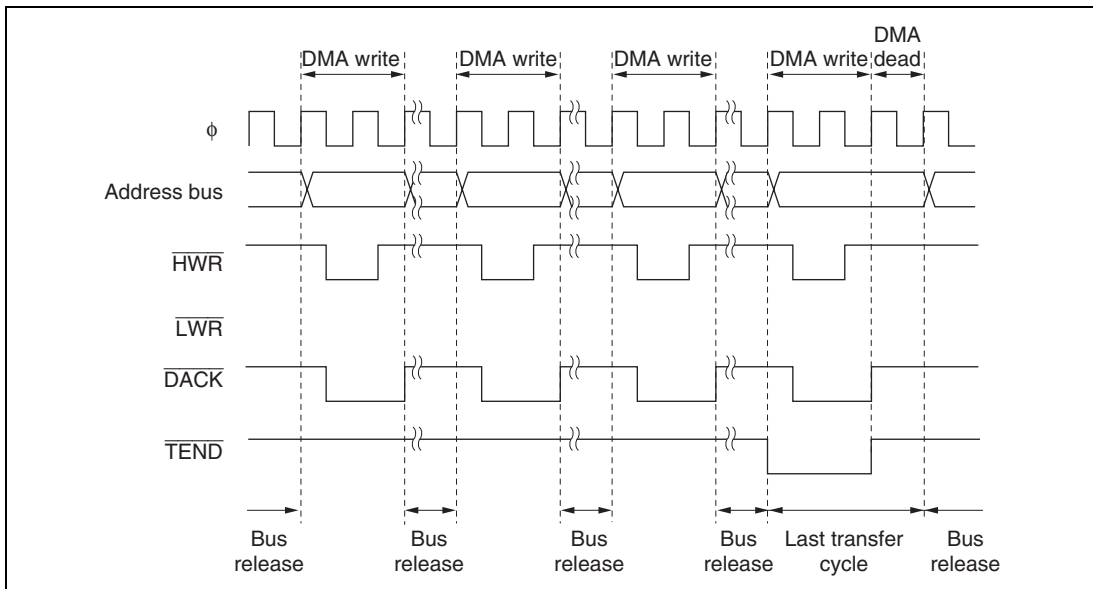

**Figure 7.27 Example of Single Address Mode (Word Read) Transfer**

A byte or word transfer is performed for a single transfer request, and after the transfer, the bus is released. While the bus is released, one or more bus cycles are executed by the CPU or DTC.

In the transfer end cycle (the cycle in which the transfer counter reaches 0), a one-state DMA dead cycle is inserted after the DMA write cycle.

## (2) Single Address Mode (Write)

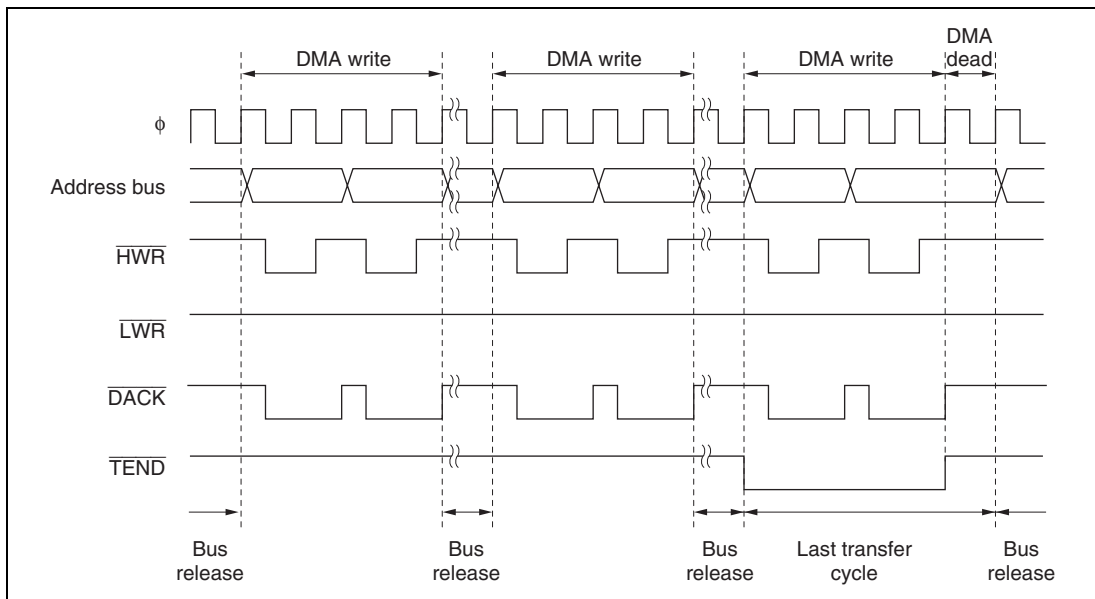

Figure 7.28 shows a transfer example in which  $\overline{\text{TEND}}$  output is enabled and byte-size single address mode transfer (write) is performed from an external device to external 8-bit, 2-state access space.

**Figure 7.28 Example of Single Address Mode Transfer (Byte Write)**

Figure 7.29 shows a transfer example in which  $\overline{\text{TEND}}$  output is enabled and word-size single address mode transfer (write) is performed from an external device to external 8-bit, 2-state access space.

**Figure 7.29 Example of Single Address Mode Transfer (Word Write)**

A byte or word transfer is performed for a single transfer request, and after the transfer, the bus is released. While the bus is released, one or more bus cycles are executed by the CPU or DTC.

In the transfer end cycle (the cycle in which the transfer counter reaches 0), a one-state DMA dead cycle is inserted after the DMA write cycle.

### (3) $\overline{\text{DREQ}}$ Pin Falling Edge Activation Timing

Set the DTA bit in DMABCRH to 1 for the channel for which the  $\overline{\text{DREQ}}$  pin is selected.

Figure 7.30 shows an example of single address mode transfer activated by the  $\overline{\text{DREQ}}$  pin falling edge.

**Figure 7.30** Example of  $\overline{\text{DREQ}}$  Pin Falling Edge Activated Single Address Mode Transfer

$\overline{\text{DREQ}}$  pin sampling is performed every cycle, with the rising edge of the next  $\phi$  cycle after the end of the DMABCR write cycle for setting the transfer enabled state as the starting point.

When the  $\overline{\text{DREQ}}$  pin low level is sampled while acceptance by means of the  $\overline{\text{DREQ}}$  pin is possible, the request is held in the DMAC. Then, when activation is initiated in the DMAC, the request is cleared, and  $\overline{\text{DREQ}}$  pin high level sampling for edge detection is started. If  $\overline{\text{DREQ}}$  pin high level sampling has been completed by the time the DMA single cycle ends, acceptance resumes after the end of the single cycle,  $\overline{\text{DREQ}}$  pin low level sampling is performed again, and this operation is repeated until the transfer ends.

#### (4) $\overline{\text{DREQ}}$ Pin Low Level Activation Timing

Set the DTA bit in DMABCRH to 1 for the channel for which the  $\overline{\text{DREQ}}$  pin is selected.

Figure 7.31 shows an example of single address mode transfer activated by the  $\overline{\text{DREQ}}$  pin low level.

**Figure 7.31 Example of  $\overline{\text{DREQ}}$  Pin Low Level Activated Single Address Mode Transfer**

$\overline{\text{DREQ}}$  pin sampling is performed every cycle, with the rising edge of the next  $\phi$  cycle after the end of the DMABCR write cycle for setting the transfer enabled state as the starting point.

When the  $\overline{\text{DREQ}}$  pin low level is sampled while acceptance by means of the  $\overline{\text{DREQ}}$  pin is possible, the request is held in the DMAC. Then, when activation is initiated in the DMAC, the request is cleared. After the end of the single cycle, acceptance resumes,  $\overline{\text{DREQ}}$  pin low level sampling is performed again, and this operation is repeated until the transfer ends.

### 7.5.11 Write Data Buffer Function

DMAC internal-to-external dual address transfers and single address transfers can be executed at high speed using the write data buffer function, enabling system throughput to be improved.

When the WDBE bit of BCR in the bus controller is set to 1, enabling the write data buffer function, dual address transfer external write cycles or single address transfer and internal accesses (on-chip memory or internal I/O registers) are executed in parallel. Internal accesses are independent of the bus mastership, and DMAC dead cycles are regarded as internal accesses.

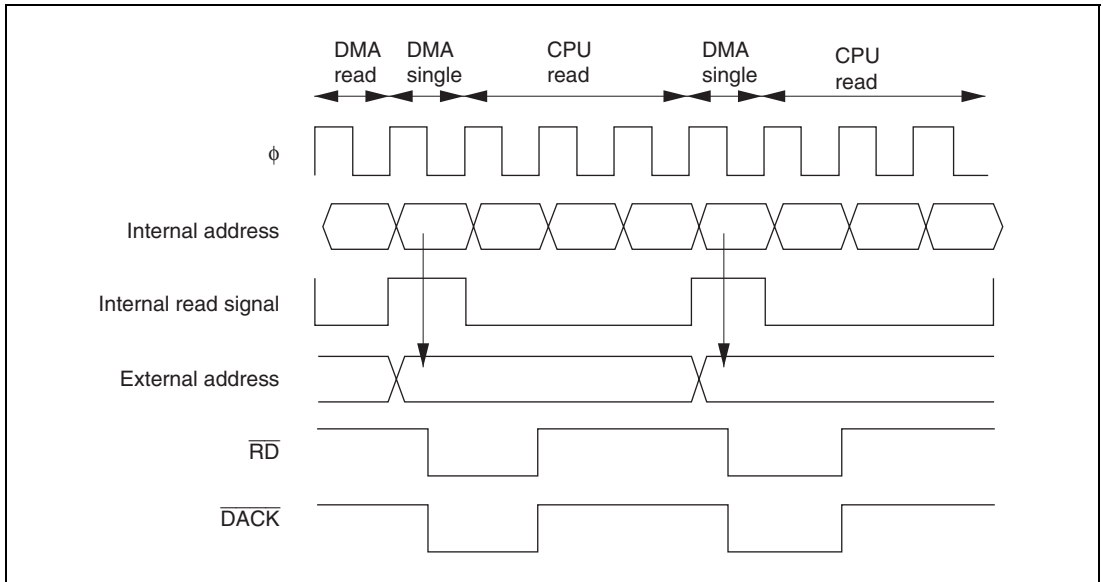

A low level can always be output from the  $\overline{\text{TEND}}$  pin if the bus cycle in which a low level is to be output from the  $\overline{\text{TEND}}$  pin is an external bus cycle. However, a low level is not output from the  $\overline{\text{TEND}}$  pin if the bus cycle in which a low level is to be output from the  $\overline{\text{TEND}}$  pin is an internal bus cycle, and an external write cycle is executed in parallel with this cycle.

Figure 7.32 shows an example of dual address transfer using the write data buffer function. The data is transferred from on-chip RAM to external memory.

**Figure 7.32 Example of Dual Address Transfer Using Write Data Buffer Function**

Figure 7.33 shows an example of single address transfer using the write data buffer function. In this example, the CPU program area is in on-chip memory.

**Figure 7.33 Example of Single Address Transfer Using Write Data Buffer Function**

When the write data buffer function is activated, the DMAC recognizes that the bus cycle concerned has ended, and starts the next operation. Therefore,  $\overline{DREQ}$  pin sampling is started one state after the start of the DMA write cycle or single address transfer.

### 7.5.12 Multi-Channel Operation

The DMAC channel priority order is: channel 0 > channel 1, and channel A > channel B. Table 7.11 summarizes the priority order for DMAC channels.

**Table 7.11 DMAC Channel Priority Order**

| Short Address Mode | Full Address Mode | Priority |
|--------------------|-------------------|----------|
| Channel 0A         | Channel 0         | High     |
| Channel 0B         |                   | ↑        |
| Channel 1A         | Channel 1         | ↓        |
| Channel 1B         |                   | Low      |

If transfer requests are issued simultaneously for more than one channel, or if a transfer request for another channel is issued during a transfer, when the bus is released, the DMAC selects the highest-priority channel from among those issuing a request according to the priority order shown in table 7.11. During burst transfer, or when one block is being transferred in block transfer, the channel will not be changed until the end of the transfer. Figure 7.34 shows a transfer example in which transfer requests are issued simultaneously for channels 0A, 0B, and 1.

**Figure 7.34 Example of Multi-Channel Transfer**

### 7.5.13 Relation between DMAC and External Bus Requests, Refresh Cycles\*<sup>1</sup>, and EXDMAC\*<sup>2</sup>

When the DMAC accesses external space, contention with a refresh cycle\*<sup>1</sup>, EXDMAC cycle\*<sup>2</sup>, or external bus release cycle may arise. In this case, the bus controller will suspend the transfer and insert a refresh cycle\*<sup>1</sup>, EXDMAC cycle\*<sup>2</sup>, or external bus release cycle, in accordance with the external bus priority order, even if the DMAC is executing a burst transfer or block transfer. (An external access by the DTC or CPU, which has a lower priority than the DMAC, is not executed until the DMAC releases the external bus.)

When the DMAC transfer mode is dual address mode, the DMAC releases the external bus after an external write cycle. The external read cycle and external write cycle are inseparable, and so the bus cannot be released between these two cycles.

When the DMAC accesses internal space (on-chip memory or an internal I/O register), the DMAC cycle may be executed at the same time as a refresh cycle\*<sup>1</sup>, EXDMAC cycle\*<sup>2</sup>, or external bus release cycle.

- Notes: 1. Not supported in the 5-V version.  
2. Not supported in the H8S/2424 Group.

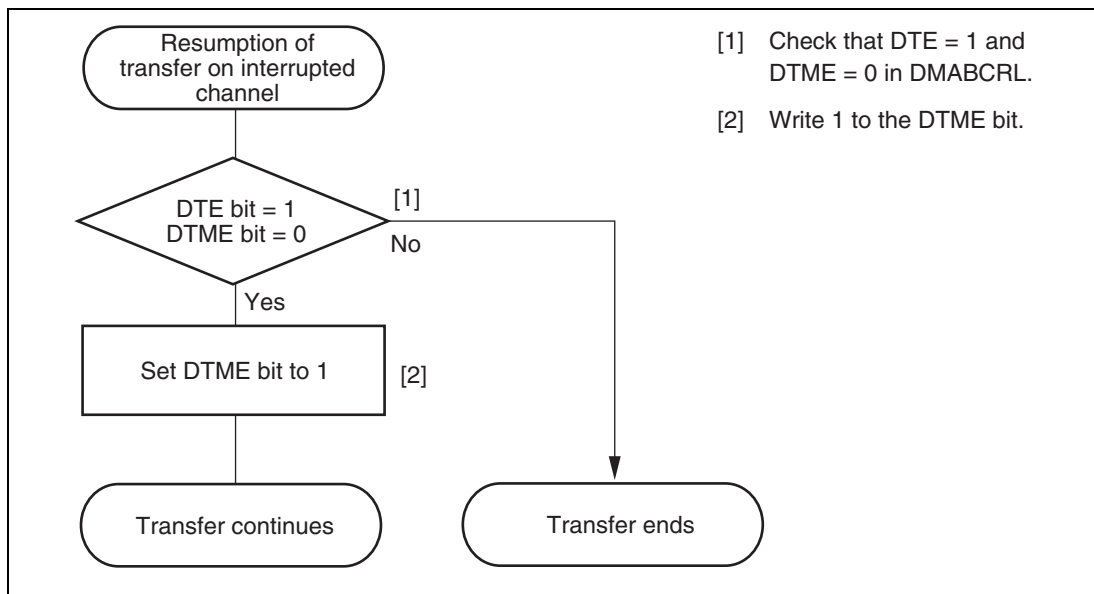

### 7.5.14 DMAC and NMI Interrupts

When an NMI interrupt is requested, burst mode transfer in full address mode is interrupted. An NMI interrupt does not affect the operation of the DMAC in other modes.

In full address mode, transfer is enabled for a channel when both the DTE bit and DTME bit in DMABCRL are set to 1. With burst mode setting, the DTME bit is cleared when an NMI interrupt is requested.

If the DTME bit is cleared during burst mode transfer, the DMAC discontinues transfer on completion of the 1-byte or 1-word transfer in progress, then releases the bus, which passes to the CPU.

The channel on which transfer was interrupted can be restarted by setting the DTME bit to 1 again. Figure 7.35 shows the procedure for continuing transfer when it has been interrupted by an NMI interrupt on a channel designated for burst mode transfer.

**Figure 7.35 Example of Procedure for Continuing Transfer on Channel Interrupted by NMI Interrupt**

### 7.5.15 Forced Termination of DMAC Operation

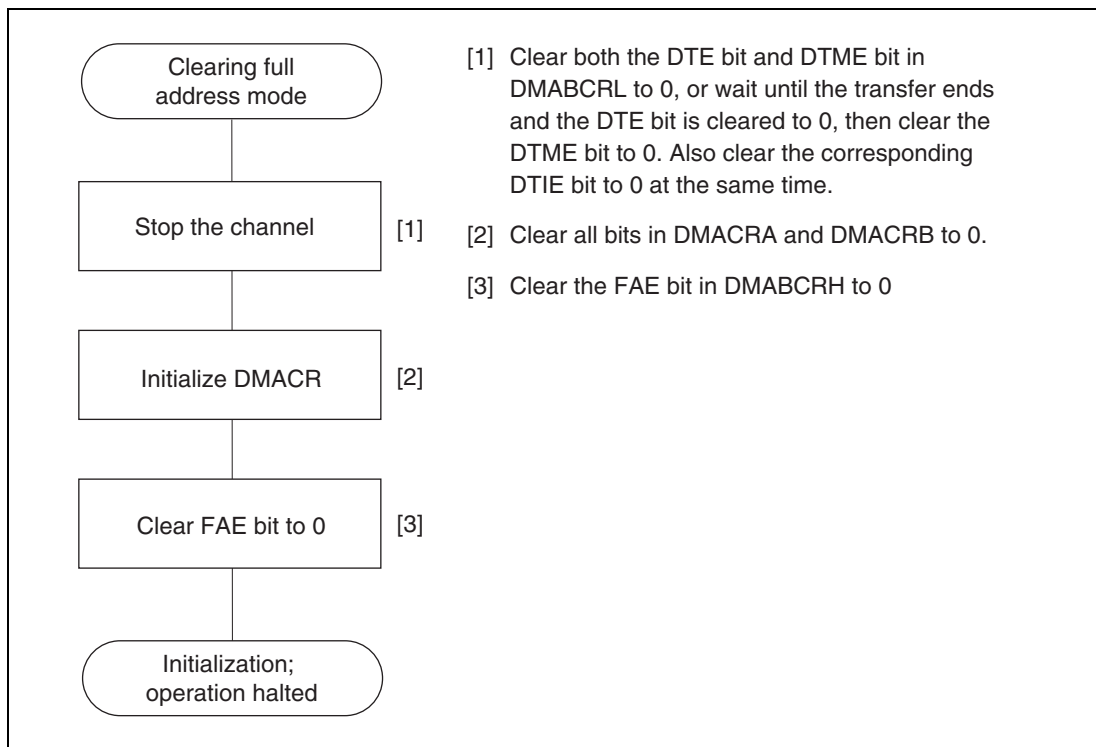

If the DTE bit in DMABCRL is cleared to 0 for the channel currently operating, the DMAC stops on completion of the 1-byte or 1-word transfer in progress. DMAC operation resumes when the DTE bit is set to 1 again. In full address mode, the same applies to the DTME bit in DMABCRL. Figure 7.36 shows the procedure for forcibly terminating DMAC operation by software.

**Figure 7.36 Example of Procedure for Forcibly Terminating DMAC Operation**

### 7.5.16 Clearing Full Address Mode

Figure 7.37 shows the procedure for releasing and initializing a channel designated for full address mode. After full address mode has been cleared, the channel can be set to another transfer mode using the appropriate setting procedure.

**Figure 7.37 Example of Procedure for Clearing Full Address Mode**

## 7.6 Interrupt Sources

The sources of interrupts generated by the DMAC are transfer end and transfer break. Table 7.12 shows the interrupt sources and their priority order.

**Table 7.12 Interrupt Sources and Priority Order**

| Interrupt Name | Interrupt Source                               |   | Interrupt Priority Order |
|----------------|--|---|--------------------------|
|                | Short Address Mode                             | Full Address Mode                               |                          |
| DMTEND0A       | Interrupt due to end of transfer on channel 0A | Interrupt due to end of transfer on channel 0   | High<br>↑<br>Low         |
| DMTEND0B       | Interrupt due to end of transfer on channel 0B | Interrupt due to break in transfer on channel 0 |                          |
| DMTEND1A       | Interrupt due to end of transfer on channel 1A | Interrupt due to end of transfer on channel 1   |                          |
| DMTEND1B       | Interrupt due to end of transfer on channel 1B | Interrupt due to break in transfer on channel 1 |                          |

Enabling or disabling of each interrupt source is set by means of the DTIE bit in DMABCRL for the corresponding channel in DMABCRL, and interrupts from each source are sent to the interrupt controller independently. The priority of transfer end interrupts on each channel is decided by the interrupt controller, as shown in table 7.12.

Figure 7.38 shows a block diagram of a transfer end/transfer break interrupt. An interrupt is always generated when the DTIE bit is set to 1 while the DTE bit in DMABCRL is cleared to 0.

**Figure 7.38 Block Diagram of Transfer End/Transfer Break Interrupt**

In full address mode, a transfer break interrupt is generated when the DTME bit is cleared to 0 while the DTIE bit is set to 1. In both short address mode and full address mode, DMABCR should be set so as to prevent the occurrence of a combination that constitutes a condition for interrupt generation during setting.

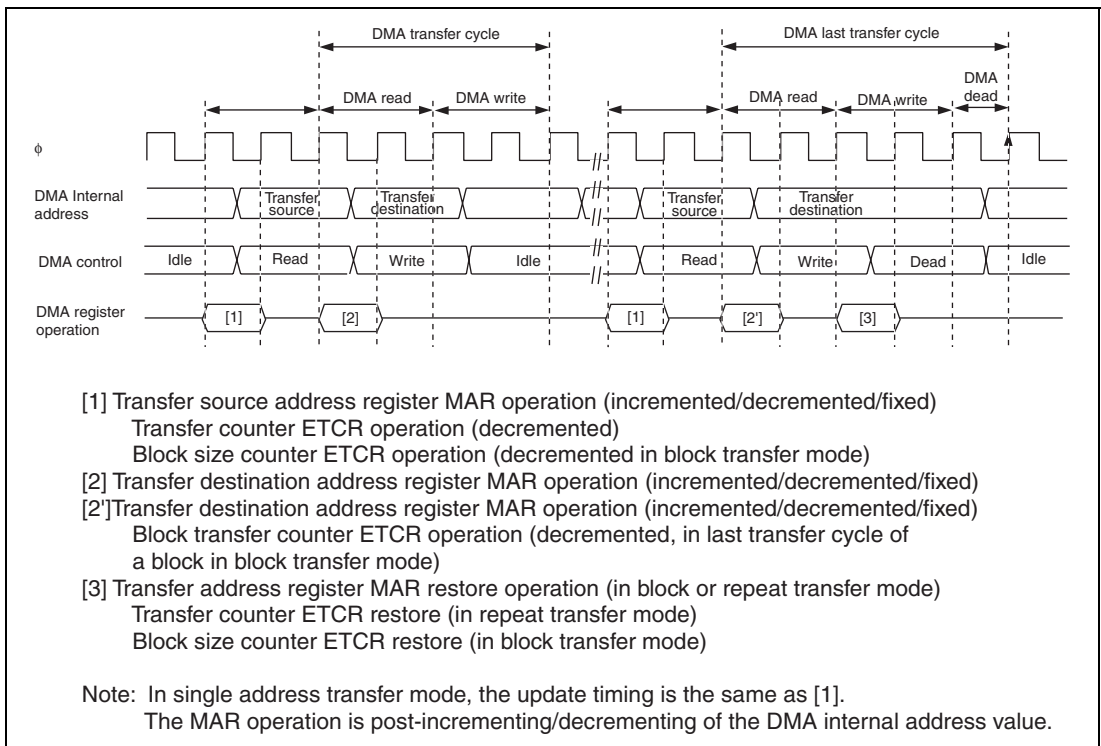

## 7.7 Usage Notes

### (1) DMAC Register Access during Operation

Except for forced termination of the DMAC, the operating (including transfer waiting state) channel setting should not be changed. The operating channel setting should only be changed when transfer is disabled. Also, DMAC registers should not be written to in a DMA transfer.

DMAC register reads during operation (including the transfer waiting state) are described below.

- DMAC control starts one cycle before the bus cycle, with output of the internal address. Consequently, MAR is updated in the bus cycle before DMA transfer. Figure 7.39 shows an example of the update timing for DMAC registers in dual address transfer mode.

**Figure 7.39 DMAC Register Update Timing**

- If a DMAC transfer cycle occurs immediately after a DMAC register read cycle, the DMAC register is read as shown in figure 7.40.

**Figure 7.40 Contention between DMAC Register Update and CPU Read**

## (2) Module Stop

When the MSTP13 bit in MSTPCRH is set to 1, the DMAC clock stops, and the module stop state is entered. However, 1 cannot be written to the MSTP13 bit if any of the DMAC channels is enabled. This setting should therefore be made when DMAC operation is stopped.

When the DMAC clock stops, DMAC register accesses can no longer be made. Since the following DMAC register settings are valid even in the module stop state, they should be invalidated, if necessary, before a module stop.

- Transfer end/break interrupt ( $DTE = 0$  and  $DTIE = 1$ )
- $\overline{TEND}$  pin enable ( $TEE = 1$ )
- $\overline{DACK}$  pin enable ( $F AE = 0$  and  $SAE = 1$ )

### (3) Write Data Buffer Function

When the WDBE bit of BCR in the bus controller is set to 1, enabling the write data buffer function, dual address transfer external write cycles or single address transfers and internal accesses (on-chip memory or internal I/O registers) are executed in parallel.

- Write data buffer function and DMAC register setting

If the setting of a register that controls external accesses is changed during execution of an external access by means of the write data buffer function, the external access may not be performed normally. Registers that control external accesses should only be manipulated when external reads, etc., are used with DMAC operation disabled, and the operation is not performed in parallel with external access.

- Write data buffer function and next DMAC operation

The DMAC can start its next operation during external access using the write data buffer function. Consequently, the  $\overline{\text{DREQ}}$  pin sampling timing,  $\overline{\text{TEND}}$  output timing, etc., are different from the case in which the write data buffer function is disabled. Also, internal bus cycles maybe hidden, and not visible.

### (4) $\overline{\text{TEND}}$ Output

If the last transfer cycle is for an internal address, note that even if low-level output at the  $\overline{\text{TEND}}$  pin has been set, a low level may not be output at the  $\overline{\text{TEND}}$  pin under the following external bus conditions since the last transfer cycle (internal bus cycle) and the external bus cycle are executed in parallel.

1. EXDMAC cycle\*<sup>1</sup>
2. Write cycle with write buffer mode enabled
3. DMAC single address cycle for a different channel with write buffer mode enabled
4. Bus release cycle
5. CBR refresh cycle

Figure 7.41 shows an example in which a low level is not output from the  $\overline{\text{TEND}}$  pin in case 2 above.

If the last transfer cycle is an external address cycle, a low level is output at the  $\overline{\text{TEND}}$  pin in synchronization with the bus cycle.

However, if the last transfer cycle and a CBR refresh\*<sup>2</sup> occur simultaneously, note that although the CBR refresh\*<sup>2</sup> and the last transfer cycle may be executed consecutively,  $\overline{\text{TEND}}$  may also go low in this case for the refresh cycle\*<sup>2</sup>.

- Notes: 1. Not supported in the H8S/2424 Group.  
2. Not supported in the 5-V version.

**Figure 7.41 Example in which Low Level Is Not Output at  $\overline{TEND}$  Pin**

### (5) Activation by Falling Edge on $\overline{\text{DREQ}}$ Pin

$\overline{\text{DREQ}}$  pin falling edge detection is performed in synchronization with DMAC internal operations. The operation is as follows:

- [1] Activation request wait state: Waits for detection of a low level on the  $\overline{\text{DREQ}}$  pin, and switches to [2].
- [2] Transfer wait state: Waits for DMAC data transfer to become possible, and switches to [3].
- [3] Activation request disabled state: Waits for detection of a high level on the  $\overline{\text{DREQ}}$  pin, and switches to [1].

After DMAC transfer is enabled, a transition is made to [1]. Thus, initial activation after transfer is enabled is performed on detection of a low level.

### (6) Activation Source Acceptance

At the start of activation source acceptance, a low level is detected in both  $\overline{\text{DREQ}}$  pin falling edge sensing and low level sensing. Similarly, in the case of an internal interrupt, the interrupt request is detected. Therefore, a request is accepted from an internal interrupt or  $\overline{\text{DREQ}}$  pin low level that occurs before write to DMABCRL to enable transfer.

When the DMAC is activated, take any necessary steps to prevent an internal interrupt or  $\overline{\text{DREQ}}$  pin low level remaining from the end of the previous transfer, etc.

### (7) Internal Interrupt after End of Transfer

When the DTE bit in DMABCRL is cleared to 0 at the end of a transfer or by a forcible termination, the selected internal interrupt request will be sent to the CPU or DTC even if the DTA bit in DMABCRH is set to 1.

Also, if internal DMAC activation has already been initiated when operation is forcibly terminated, the transfer is executed but flag clearing is not performed for the selected internal interrupt even if the DTA bit is set to 1.

An internal interrupt request following the end of transfer or a forcible termination should be handled by the CPU as necessary.

## (8) Channel Re-Setting

To reactivate a number of channels when multiple channels are enabled, use exclusive handling of transfer end interrupts, and perform DMABCR control bit operations exclusively.

Note, in particular, that in cases where multiple interrupts are generated between reading and writing of DMABCR, and a DMABCR operation is performed during new interrupt handling, the DMABCR write data in the original interrupt handling routine will be incorrect, and the write may invalidate the results of the operations by the multiple interrupts. Ensure that overlapping DMABCR operations are not performed by multiple interrupts, and that there is no separation between read and write operations by the use of a bit-manipulation instruction.

Also, when the DTE and DTME bits are cleared by the DMAC or are written with 0, they must first be read while cleared to 0 before the CPU can write 1 to them.

## Section 8 EXDMA Controller (EXDMAC)

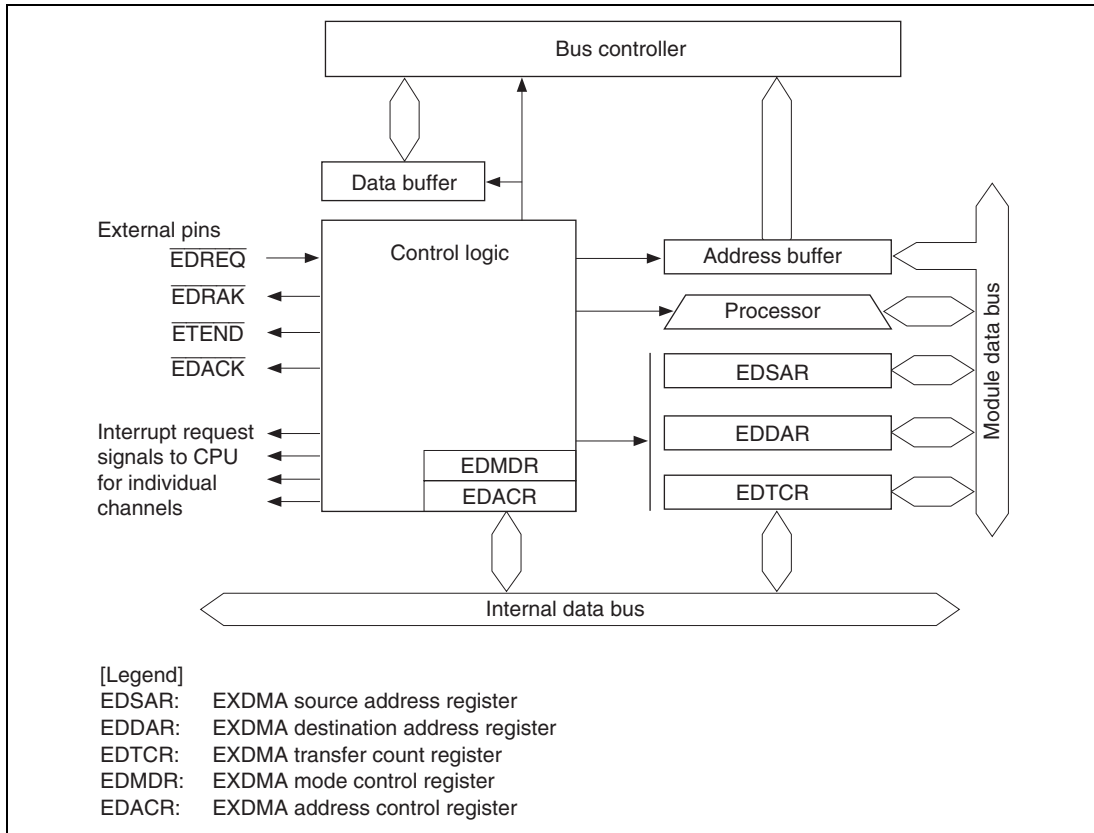

This LSI has a built-in dual-channel external bus transfer DMA controller (EXDMAC). The EXDMAC can carry out high-speed data transfer, in place of the CPU, to and from external devices and external memory with a DACK (DMA transfer notification) facility.

Note: This EXDMAC is not supported by the H8S/2424 Group.

### 8.1 Features

- Direct specification of 16-Mbyte address space
- Selection of byte or word transfer data length
- Maximum number of transfers: 16M (16,777,215)/infinite (free-running)
- Selection of dual address mode or single address mode
- Selection of cycle steal mode or burst mode as bus mode
- Selection of normal mode or block transfer mode as transfer mode
- Two kinds of transfer requests: external request and auto-request
- An interrupt request can be sent to the CPU at the end of the specified number of transfers.
- Repeat area designation function:
- Operation in parallel with internal bus master:
- Acceptance of a transfer request and the start of transfer processing can be reported to an external device via the  $\overline{\text{EDRAK}}$  pin.
- Module stop state can be set.

Figure 8.1 shows a block diagram of the EXDMAC.

**Figure 8.1 Block Diagram of EXDMAC**

## 8.2 Input/Output Pins

Table 8.1 shows the pin configuration of the EXDMAC.

**Table 8.1 Pin Configuration**

| Channel | Name  | Abbreviation               | I/O    | Function  |
|---------|---|----------------------------|--------|---|
| 2       | EXDMA transfer request 2                          | $\overline{\text{EDREQ2}}$ | Input  | Channel 2 external request  |
|         | EXDMA transfer acknowledge 2                      | $\overline{\text{EDACK2}}$ | Output | Channel 2 single address transfer acknowledge   |
|         | EXDMA transfer end 2                              | $\overline{\text{ETEND2}}$ | Output | Channel 2 transfer end  |
|         | $\overline{\text{EDREQ2}}$ acceptance acknowledge | $\overline{\text{EDRAK2}}$ | Output | Notification to external device of channel 2 external request acceptance and start of transfer processing |
| 3       | EXDMA transfer request 3                          | $\overline{\text{EDREQ3}}$ | Input  | Channel 3 external request  |
|         | EXDMA transfer acknowledge 3                      | $\overline{\text{EDACK3}}$ | Output | Channel 3 single address transfer acknowledge   |
|         | EXDMA transfer end 3                              | $\overline{\text{ETEND3}}$ | Output | Channel 3 transfer end  |
|         | $\overline{\text{EDREQ3}}$ acceptance acknowledge | $\overline{\text{EDRAK3}}$ | Output | Notification to external device of channel 3 external request acceptance and start of transfer processing |

## 8.3 Register Descriptions

The EXDMAC has the following registers.

- EXDMA source address register\_2 (EDSAR\_2)
- EXDMA destination address register\_2 (EDDAR\_2)
- EXDMA transfer count register\_2 (EDTCR\_2)
- EXDMA mode control register\_2 (EDMDR\_2)
- EXDMA address control register\_2 (EDACR\_2)
- EXDMA source address register\_3 (EDSAR\_3)
- EXDMA destination address register\_3 (EDDAR\_3)
- EXDMA transfer count register\_3 (EDTCR\_3)
- EXDMA mode control register\_3 (EDMDR\_3)
- EXDMA address control register\_3 (EDACR\_3)

### 8.3.1 EXDMA Source Address Register (EDSAR)

EDSAR is a 32-bit readable/writable register that specifies the transfer source address. An address update function is provided that updates the register contents to the next transfer source address each time transfer processing is performed. In single address mode, the EDSAR value is ignored when a device with  $\overline{\text{DACK}}$  is specified as the transfer source.

The upper 8 bits of EDSAR are reserved; they are always read as 0 and cannot be modified. Only 0 should be written to these bits.

EDSAR can be read at all times by the CPU. When reading EDSAR for a channel on which EXDMA transfer processing is in progress, a longword-size read must be executed. Do not write to EDSAR for a channel on which EXDMA transfer is in progress. The initial values of EDSAR are undefined.

### 8.3.2 EXDMA Destination Address Register (EDDAR)

EDDAR is a 32-bit readable/writable register that specifies the transfer destination address. An address update function is provided that updates the register contents to the next transfer destination address each time transfer processing is performed. In single address mode, the EDDAR value is ignored when a device with  $\overline{DACK}$  is specified as the transfer destination.

The upper 8 bits of EDDAR are reserved; they are always read as 0 and cannot be modified. Only 0 should be written to these bits.

EDDAR can be read at all times by the CPU. When reading EDDAR for a channel on which EXDMA transfer processing is in progress, a longword-size read must be executed. Do not write to EDDAR for a channel on which EXDMA transfer is in progress. The initial values of EDDAR are undefined.

### 8.3.3 EXDMA Transfer Count Register (EDTCR)

EDTCR specifies the number of transfers. The function differs according to the transfer mode. Do not write to EDTCR for a channel on which EXDMA transfer is in progress.

#### (1) Normal Transfer Mode

| Bit      | Bit Name | Initial Value | R/W | Description   |
|----------|----------|---------------|-----|---|
| 31 to 24 | —        | All 0         | —   | Reserved<br>These bits are always read as 0 and cannot be modified.   |
| 23 to 0  |          | All 0         | R/W | 24-Bit Transfer Counter<br>These bits specify the number of transfers. Setting H'000001 specifies one transfer. Setting H'000000 means no specification for the number of transfers, and the transfer counter function is halted. In this case, there is no transfer end interrupt by the transfer counter. Setting H'FFFFFF specifies the maximum number of transfers, that is 16,777,215. During EXDMA transfer, this counter shows the remaining number of transfers.<br>This counter can be read at all times. When reading EDTCR for a channel on which EXDMA transfer processing is in progress, a longword-size read must be executed. |

**(2) Block Transfer Mode**

| <b>Bit</b> | <b>Bit Name</b> | <b>Initial Value</b> | <b>R/W</b> | <b>Description</b>   |
|------------|-----------------|----------------------|------------|--|
| 31 to 24   | —               | All 0                | —          | Reserved<br>These bits are always read as 0 and cannot be modified.  |
| 23 to 16   |                 | Undefined            | R/W        | Block Size<br>These bits specify the block size (number of bytes or number of words) for block transfer. Setting H'01 specifies one as the block, while setting H'00 specifies the maximum block size, that is 256. The register value always indicates the specified block size.  |
| 15 to 0    |                 | Undefined            | R/W        | 16-Bit Transfer Counter<br>These bits specify the number of block transfers. Setting H'0001 specifies one block transfer. Setting H'0000 means no specification for the number of transfers, and the transfer counter function is halted. In this case, there is no transfer end interrupt by the transfer counter. Setting H'FFFF specifies the maximum number of block transfers, that is 65,535. During EXDMA transfer, this counter shows the remaining number of block transfers. |

### 8.3.4 EXDMA Mode Control Register (EDMDR)

EDMDR controls EXDMAC operations.

| Bit | Bit Name | Initial Value | R/W   | Description  |
|-----|----------|---------------|-------|--|
| 15  | EDA      | 0             | R/(W) | <p>EXDMA Active</p> <p>Enables or disables data transfer on the corresponding channel. When this bit is set to 1, this indicates that an EXDMA operation is in progress.</p> <p>When auto request mode is specified (by bits MDS1 and MDS0), transfer processing begins when this bit is set to 1. With external requests, transfer processing begins when a transfer request is issued after this bit has been set to 1. When this bit is cleared to 0 during an EXDMA operation, transfer is halted. If this bit is cleared to 0 during an EXDMA operation in block transfer mode, transfer processing is continued for the currently executing one-block transfer, and the bit is cleared on completion of the currently executing one-block transfer.</p> <p>If an external source that ends (aborts) transfer occurs, this bit is automatically cleared to 0 and transfer is terminated. Do not change the operating mode, transfer method, or other parameters while this bit is set to 1.</p> <p>0: Data transfer disabled on corresponding channel<br/>[Clearing conditions]</p> <ul style="list-style-type: none"> <li>• When the specified number of transfers end</li> <li>• When operation is halted by a repeat area overflow interrupt</li> <li>• When 0 is written to EDA while EDA = 1<br/>(In block transfer mode, write is effective after end of one-block transfer)</li> <li>• Reset, NMI interrupt, hardware standby mode</li> </ul> <p>1: Data transfer enabled on corresponding channel</p> <p>Note: The value written in the EDA bit may not be effective immediately.</p> |

| Bit | Bit Name | Initial Value | R/W    | Description  |
|-----|----------|---------------|--------|--|
| 14  | BEF      | 0             | R/(W)* | <p>Block Transfer Error Flag</p> <p>Flag that indicates the occurrence of an error during block transfer. If an NMI interrupt is generated during block transfer, the EXDMAC immediately terminates the EXDMA operation and sets this bit to 1. The address registers indicate the next transfer addresses, but the data for which transfer has been performed within the block size is lost.</p> <p>0: No block transfer error<br/>[Clearing condition]</p> <p>Writing 0 to BEF after reading BEF = 1</p> <p>1: Block transfer error<br/>[Setting condition]</p> <p>NMI interrupt during block transfer</p> |
| 13  | EDRAKE   | 0             | R/W    | <p><math>\overline{\text{EDRAK}}</math> Pin Output Enable</p> <p>Enables output from the <math>\overline{\text{EDREQ}}</math> acknowledge/transfer processing start (<math>\overline{\text{EDRAK}}</math>) pin.</p> <p>0: <math>\overline{\text{EDRAK}}</math> pin output disabled<br/>1: <math>\overline{\text{EDRAK}}</math> pin output enabled</p>  |
| 12  | ETENDE   | 0             | R/W    | <p><math>\overline{\text{ETEND}}</math> Pin Output Enable</p> <p>Enables output from the EXDMA transfer end (<math>\overline{\text{ETEND}}</math>) pin.</p> <p>0: <math>\overline{\text{ETEND}}</math> pin output disabled<br/>1: <math>\overline{\text{ETEND}}</math> pin output enabled</p>  |
| 11  | EDREQS   | 0             | R/W    | <p><math>\overline{\text{EDREQ}}</math> Select</p> <p>Specifies low level sensing or falling edge sensing as the sampling method for the <math>\overline{\text{EDREQ}}</math> pin used in external request mode.</p> <p>0: Low level sensing (Low level sensing is used for the first transfer after transfer is enabled.)<br/>1: Falling edge sensing</p>   |

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 10  | AMS      | 0             | R/W | <p>Address Mode Select</p> <p>Selects single address mode or dual address mode. When single address mode is selected, the <math>\overline{\text{EDACK}}</math> pin is valid.</p> <p>0: Dual address mode<br/>1: Single address mode</p>   |
| 9   | MDS1     | 0             | R/W | Mode Select 1 and 0   |
| 8   | MDS0     | 0             | R/W | <p>These bits specify the activation source, bus mode, and transfer mode.</p> <p>00: Auto request, cycle steal mode, normal transfer mode<br/>01: Auto request, burst mode, normal transfer mode<br/>10: External request, cycle steal mode, normal transfer mode<br/>11: External request, cycle steal mode, block transfer mode</p> |
| 7   | EDIE     | 0             | R/W | <p>EXDMA Interrupt Enable</p> <p>Enables or disables interrupt requests. When this bit is set to 1, an interrupt is requested when the IRF bit is set to 1. The interrupt request is cleared by clearing this bit or the IRF bit to 0.</p> <p>0: Interrupt request is not generated<br/>1: Interrupt request is generated</p>         |

| Bit | Bit Name | Initial Value | R/W    | Description   |
|-----|----------|---------------|--------|---|
| 6   | IRF      | 0             | R/(W)* | <p>Interrupt Request Flag</p> <p>Flag indicating that an interrupt request has occurred and transfer has ended.</p> <p>0: No interrupt request</p> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> <li>• Writing 1 to the EDA bit</li> <li>• Writing 0 to IRF after reading IRF = 1</li> </ul> <p>1: Interrupt request occurrence</p> <p>[Setting conditions]</p> <ul style="list-style-type: none"> <li>• Transfer end interrupt request generated by transfer counter</li> <li>• Source address repeat area overflow interrupt request</li> <li>• Destination address repeat area overflow interrupt request</li> </ul> |
| 5   | TCEIE    | 0             | R/W    | <p>Transfer Counter End Interrupt Enable</p> <p>Enables or disables transfer end interrupt requests by the transfer counter. When transfer ends according to the transfer counter while this bit is set to 1, the IRF bit is set to 1, indicating that an interrupt request has occurred.</p> <p>0: Transfer end interrupt requests by transfer counter are disabled</p> <p>1: Transfer end interrupt requests by transfer counter are enabled</p>  |
| 4   | SDIR     | 0             | R/W    | <p>Single Address Direction</p> <p>Specifies the data transfer direction in single address mode. In dual address mode, the specification by this bit is ignored.</p> <p>0: Transfer direction: EDSAR → external device with <math>\overline{DACK}</math></p> <p>1: Transfer direction: External device with <math>\overline{DACK}</math> → EDDAR</p>  |

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 3   | DTSIZE   | 0             | R/W | Data Transmit Size<br>Specifies the size of data to be transferred.<br>0: Byte-size<br>1: Word-size   |
| 2   | BGUP     | 0             | R/W | Bus Give-Up<br>When this bit is set to 1, the bus can be transferred to an internal bus master in burst mode or block transfer mode. This setting is ignored in normal mode and cycle steal mode.<br>0: Bus is not released<br>1: Bus is transferred if requested by an internal bus master |
| 1   | —        | 0             | R/W | Reserved  |
| 0   | —        | 0             | R/W | These bits are always read as 0. The initial values should not be modified.   |

Note: \* Only 0 can be written, to clear the flag.

### 8.3.5 EXDMA Address Control Register (EDACR)

EDACR specifies address register incrementing/decrementing and use of the repeat area function.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 15  | SAT1     | 0             | R/W | Source Address Update Mode   |
| 14  | SAT0     | 0             | R/W | <p>These bits specify incrementing/decrementing of the transfer source address (EDSAR). When an external device with DACK is designated as the transfer source in single address mode, the specification by these bits is ignored.</p> <p>0x: Fixed</p> <p>10: Incremented (+1 in byte transfer, +2 in word transfer)</p> <p>11: Decrementd (−1 in byte transfer, −2 in word transfer)</p>   |
| 13  | SARIE    | 0             | R/W | <p>Source Address Repeat Interrupt Enable</p> <p>When this bit is set to 1, in the event of source address repeat area overflow, the IRF bit is set to 1 and the EDA bit cleared to 0 in EDMDR, and transfer is terminated. If the EDIE bit in EDMDR is 1 when the IRF bit in EDMDR is set to 1, an interrupt request is sent to the CPU.</p> <p>When used together with block transfer mode, a source address repeat interrupt is requested at the end of a block-size transfer. If a source address repeat area has not been designated, this bit is ignored.</p> <p>0: Source address repeat interrupt is not requested</p> <p>1: When source address repeat area overflow occurs, the IRF bit in EDMDR is set to 1 and an interrupt is requested</p> |

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 12  | SARA4    | 0             | R/W | Source Address Repeat Area   |
| 11  | SARA3    | 0             | R/W | These bits specify the source address (EDSAR) repeat area. The repeat area function updates the specified lower address bits, leaving the remaining upper address bits always the same. A repeat area size of 2 bytes to 8 Mbytes can be specified. The setting interval is a power-of-two number of bytes. When repeat area overflow results from incrementing or decrementing an address, the lower address is the start address of the repeat area in the case of address incrementing, or the last address of the repeat area in the case of address decrementing. If the SARIE bit is set to 1, an interrupt can be requested when repeat area overflow occurs. |
| 10  | SARA2    | 0             | R/W |  |
| 9   | SARA1    | 0             | R/W |  |

## 8.4 Operation

### 8.4.1 Transfer Modes

The transfer modes of the EXDMAC are summarized in table 8.2.

**Table 8.2 EXDMAC Transfer Modes**

| Transfer Mode       |  |   | Transfer Origin  | Number of Transfers                 | Address Registers                   |                 |
|---------------------|--|---|------------------|-------------------------------------|-------------------------------------|-----------------|
|                     |  |   |                  |                                     | Source                              | Destination     |
| Dual address mode   | Normal transfer mode   | Auto request mode <ul style="list-style-type: none"> <li>Burst/cycle steal mode</li> </ul>  | Auto request     | 1 to 16,777,215 or no specification | EDSAR                               | EDDAR           |
|                     |  | External request mode <ul style="list-style-type: none"> <li>Cycle steal mode</li> </ul>  | External request |                                     |                                     |                 |
|                     | Block transfer mode  | External request mode <ul style="list-style-type: none"> <li>Burst transfer of specified block size for a single transfer request</li> <li>Block size: 1 to 256 bytes or words</li> </ul> | External request | 1 to 65,535 or no specification     |                                     |                 |
| Single address mode | <ul style="list-style-type: none"> <li>Direct data transfer to/from external device using <math>\overline{\text{EDACK}}</math> pin instead of source or destination address register</li> <li>Above transfer mode can be specified in addition to address register setting</li> <li>One transfer possible in one bus cycle</li> </ul> (Transfer mode variations are the same as in dual address mode.) |   |                  |                                     | EDSAR/<br>$\overline{\text{EDACK}}$ | EDACK/<br>EDDAR |

The transfer mode can be set independently for each channel.

In normal transfer mode, a one-byte or one-word transfer is executed in response to one transfer request. With auto requests, burst or cycle steal transfer mode can be set. In burst transfer mode, continuous, high-speed transfer can be performed until the specified number of transfers have been executed or the transfer enable bit is cleared to 0.

In block transfer mode, a transfer of the specified block size is executed in response to one transfer request. The block size can be from 1 to 256 bytes or words. Within a block, transfer can be performed at the same high speed as in block transfer mode.

When the "no specification" setting (EDTCR = H'000000) is made for the number of transfers, the transfer counter is halted and there is no limit on the number of transfers, allowing transfer to be performed endlessly.

Incrementing or decrementing the memory address by 1 or 2, or leaving the address unchanged, can be specified independently for each address register.

In all transfer modes, it is possible to set a repeat area comprising a power-of-two number of bytes.

## 8.4.2 Address Modes

### (1) Dual Address Mode

In dual address mode, both the transfer source and transfer destination are specified by registers in the EXDMAC, and one transfer is executed in two bus cycles.

The transfer source address is set in the source address register (EDSAR), and the transfer destination address is set in the transfer destination address register (EDDAR).

In a transfer operation, the value in external memory specified by the transfer source address is read in the first bus cycle, and is written to the external memory specified by the transfer destination address in the next bus cycle.

These consecutive read and write cycles are indivisible: another bus cycle (external access by an internal bus master, refresh cycle, or external bus release cycle) does not occur between these two cycles.

$\overline{\text{ETEND}}$  pin output can be enabled or disabled by means of the ETENDE bit in EDMDR.  $\overline{\text{ETEND}}$  is output for two consecutive bus cycles. The  $\overline{\text{EDACK}}$  signal is not output.

Figure 8.2 shows an example of the timing in dual address mode.

**Figure 8.2 Example of Timing in Dual Address Mode**

## (2) Single Address Mode

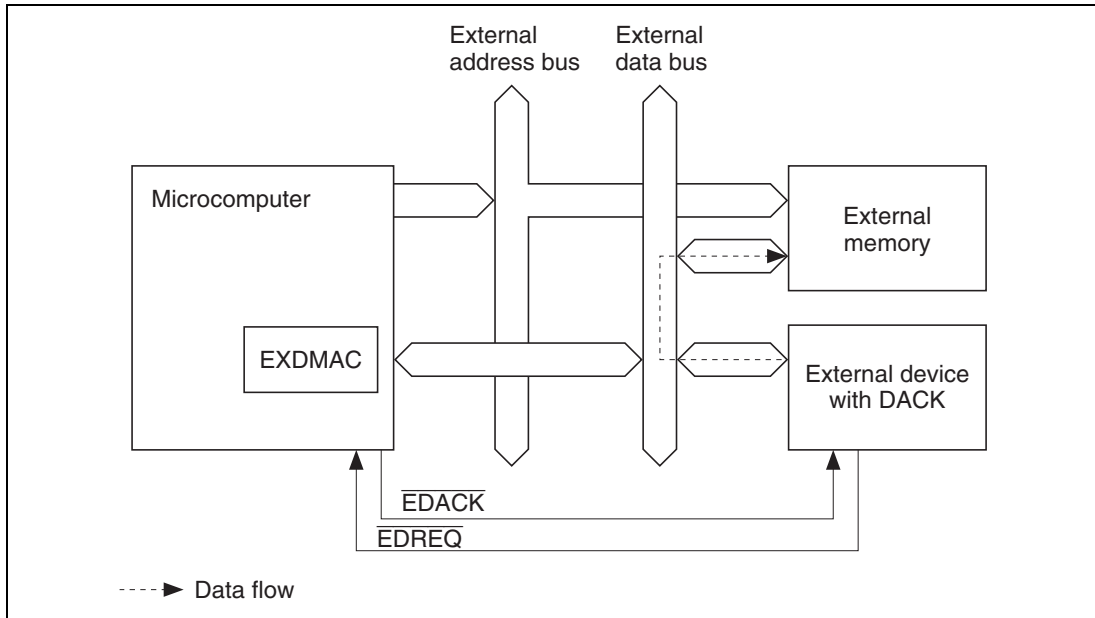

In single address mode, the  $\overline{EDACK}$  signal is used instead of the source or destination address register to transfer data directly between an external device and external memory. In this mode, the EXDMAC accesses the transfer source or transfer destination external device by outputting the external I/O strobe signal ( $\overline{EDACK}$ ), and at the same time accesses the other external device in the transfer by outputting an address. In this way, DMA transfer can be executed in one bus cycle. In the example of transfer between external memory and an external device with DACK shown in figure 8.3, data is output to the data bus by the external device and written to external memory in the same bus cycle.

The transfer direction, that is whether the external device with DACK is the transfer source or transfer destination, can be specified with the SDIR bit in EDMDR. Transfer is performed from the external memory (EDSAR) to the external device with DACK when SDIR = 0, and from the external device with DACK to the external memory (EDDAR) when SDIR = 1.

The setting in the source or destination address register not used in the transfer is ignored.

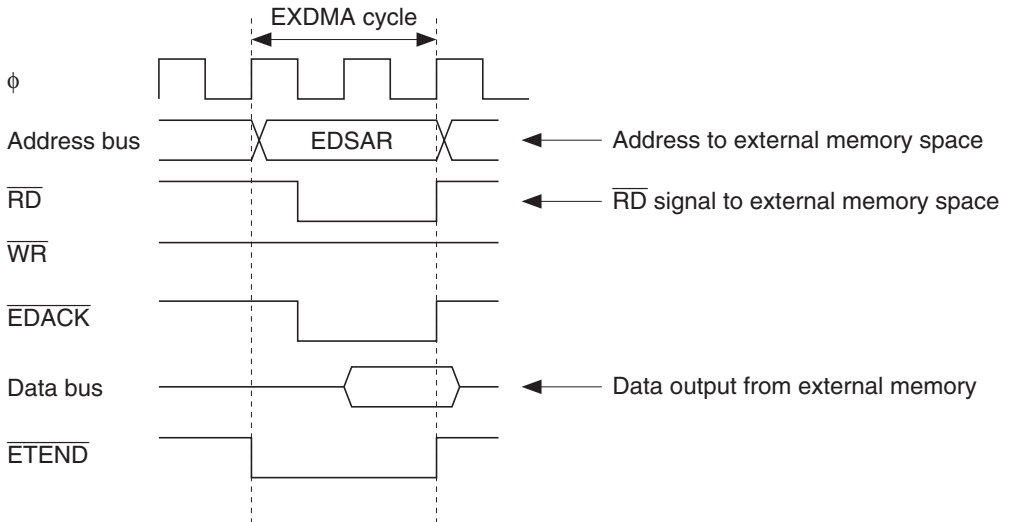

The  $\overline{EDACK}$  pin becomes valid automatically when single address mode is selected. The  $\overline{EDACK}$  pin is active-low.  $\overline{ETEND}$  pin output can be enabled or disabled by means of the ETENDE bit in EDMDR.  $\overline{ETEND}$  is output for one bus cycle.

Figure 8.3 shows the data flow in single address mode, and figure 8.4 shows an example of the timing.

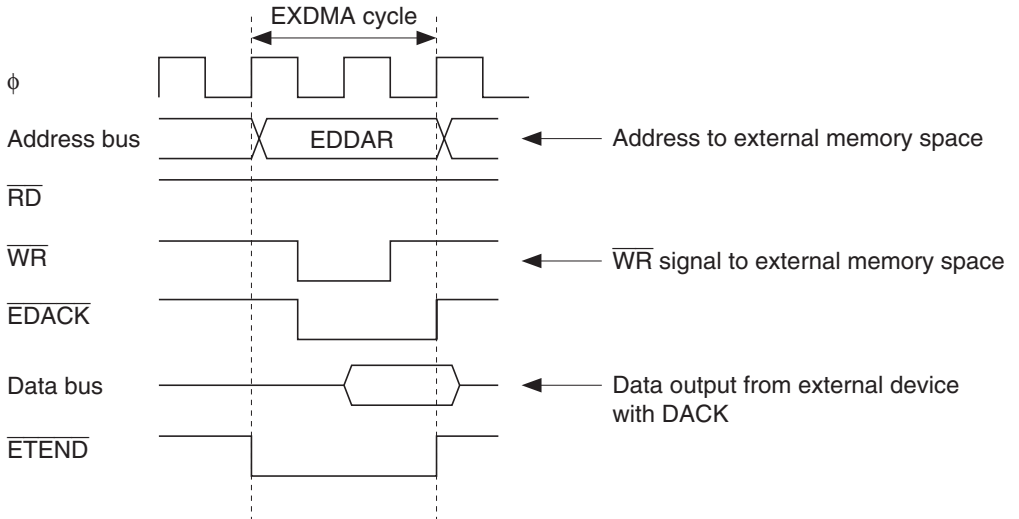

**Figure 8.3 Data Flow in Single Address Mode**

Transfer from external memory to external device with DACK

Transfer from external device with DACK to external memory

**Figure 8.4 Example of Timing in Single Address Mode**

### 8.4.3 DMA Transfer Requests

#### (1) Auto Request Mode

In auto request mode, transfer request signals are automatically generated within the EXDMAC in cases where a transfer request signal is not issued from outside, such as in transfer between two memories, or between a peripheral module that is not capable of generating transfer requests and memory. In auto request mode, transfer is started when the EDA bit is set to 1 in EDMDR.

In auto request mode, either cycle steal mode or burst mode can be selected as the bus mode. Block transfer mode cannot be used.

#### (2) External Request Mode

In external request mode, transfer is started by a transfer request signal ( $\overline{\text{EDREQ}}$ ) from a device external to this LSI. DMA transfer is started when  $\overline{\text{EDREQ}}$  is input while DMA transfer is enabled ( $\text{EDA} = 1$ ).

The transfer request source need not be the data transfer source or data transfer destination.

The transfer request signal is accepted via the  $\overline{\text{EDREQ}}$  pin. Either falling edge sensing or low level sensing can be selected for the  $\overline{\text{EDREQ}}$  pin by means of the EDREQS bit in EDMDR (low level sensing when  $\text{EDREQS} = 0$ , falling edge sensing when  $\text{EDREQS} = 1$ ).

Setting the EDRAKE bit to 1 in EDMDR enables a signal confirming transfer request acceptance to be output from the  $\overline{\text{EDRAK}}$  pin. The  $\overline{\text{EDRAK}}$  signal is output when acceptance and transfer processing has been started in response to a single external request. The  $\overline{\text{EDRAK}}$  signal enables the external device to determine the timing of  $\overline{\text{EDREQ}}$  signal negation, and makes it possible to provide handshaking between the transfer request source and the EXDMAC.

In external request mode, block transfer mode can be used instead of burst mode. Block transfer mode allows continuous execution (burst operation) of the specified number of transfers (the block size) in response to a single transfer request. In block transfer mode, the  $\overline{\text{EDRAK}}$  signal is output only once for a one-block transfer, since the transfer request via the  $\overline{\text{EDREQ}}$  pin is for a block unit.

### 8.4.4 Bus Modes

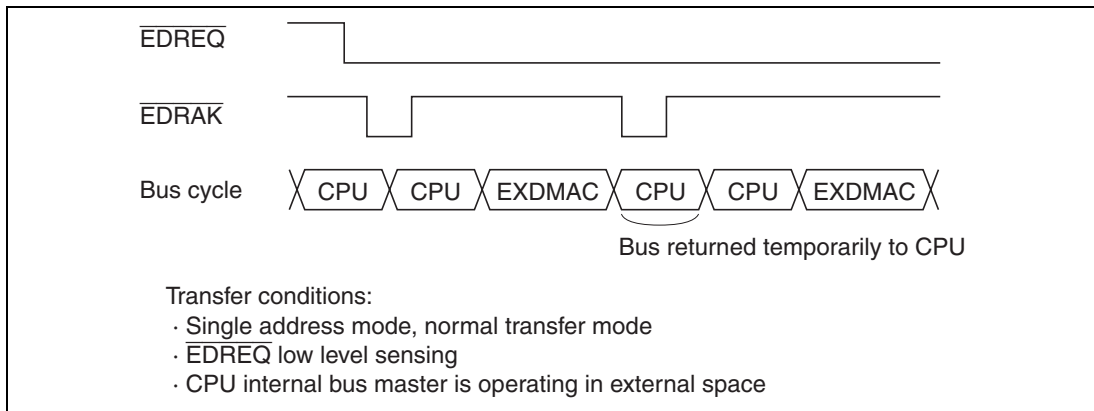

There are two bus modes: cycle steal mode and burst mode. When the activation source is an auto request, either cycle steal mode or burst mode can be selected. When the activation source is an external request, cycle steal mode is used.

#### (1) Cycle Steal Mode

In cycle steal mode, the EXDMAC releases the bus at the end of each transfer of a transfer unit (byte, word, or block). If there is a subsequent transfer request, the EXDMAC takes back the bus, performs another transfer-unit transfer, and then releases the bus again. This procedure is repeated until the transfer end condition is satisfied.

If a transfer request occurs in another channel during DMA transfer, the bus is temporarily released, then transfer is performed on the channel for which the transfer request was issued. If there is no external space bus request from another bus master, a one-cycle bus release interval is inserted. For details on the operation when there are requests for a number of channels, see section 8.4.8, Channel Priority Order.

Figure 8.5 shows an example of the timing in cycle steal mode.

**Figure 8.5 Example of Timing in Cycle Steal Mode**

## (2) Burst Mode

In burst mode, once the EXDMAC acquires the bus it continues transferring data, without releasing the bus, until the transfer end condition is satisfied. There is no burst mode in external request mode.

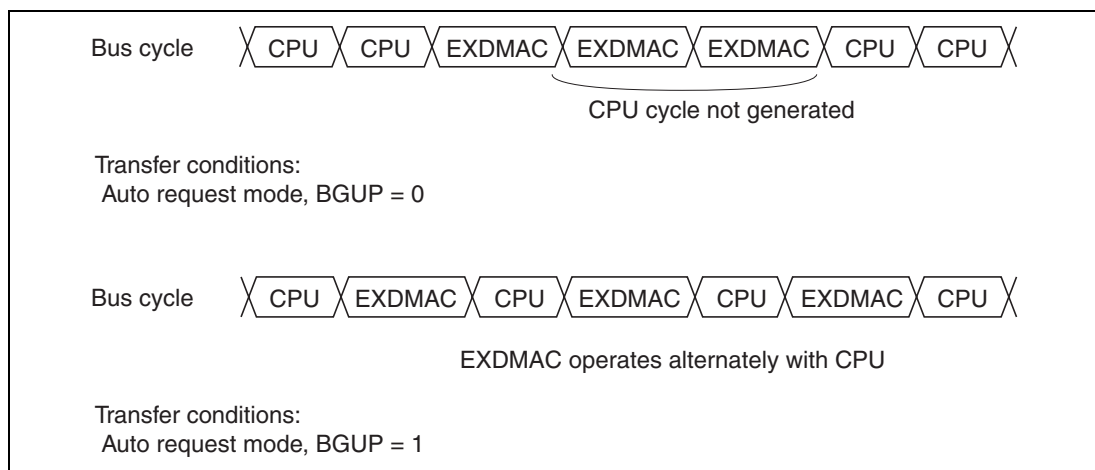

In burst mode, once transfer is started it is not interrupted even if there is a transfer request from another channel with higher priority. When the burst mode channel finishes its transfer, it releases the bus in the next cycle in the same way as in cycle steal mode.

When the EDA bit is cleared to 0 in EDMDR, DMA transfer is halted. However, DMA transfer is executed for all transfer requests generated within the EXDMAC up until the EDA bit was cleared to 0.

If a repeat area overflow interrupt is generated, the EDA bit is cleared to 0 and transfer is terminated.

When the BGUP bit is set to 1 in EDMDR, the bus is released if a bus request is issued by another bus master during burst transfer. If there is no bus request, burst transfer is executed even if the BGUP bit is set to 1.

Figure 8.6 shows examples of the timing in burst mode.

**Figure 8.6 Examples of Timing in Burst Mode**

### 8.4.5 Transfer Modes

There are two transfer modes: normal transfer mode and block transfer mode. When the activation source is an external request, either normal transfer mode or block transfer mode can be selected. When the activation source is an auto request, normal transfer mode is used.

#### (1) Normal Transfer Mode

In normal transfer mode, transfer of one transfer unit is processed in response to one transfer request. EDTCR functions as a 24-bit transfer counter.

The  $\overline{\text{ETEND}}$  signal is output only for the last DMA transfer. The  $\overline{\text{EDRAK}}$  signal is output each time a transfer request is accepted and transfer processing is started.

Figure 8.7 shows examples of DMA transfer timing in normal transfer mode.

**Figure 8.7 Examples of Timing in Normal Transfer Mode**

## (2) Block Transfer Mode

In block transfer mode, the number of bytes or words specified by the block size is transferred in response to one transfer request. The upper 8 bits of EDTCR specify the block size, and the lower 16 bits function as a 16-bit transfer counter. A block size of 1 to 256 can be specified. During transfer of a block, transfer requests for other higher-priority channels are held pending. When transfer of one block is completed, the bus is released in the next cycle.

When the BGUP bit is set to 1 in EDMDR, the bus is released if a bus request is issued by another bus master during block transfer.

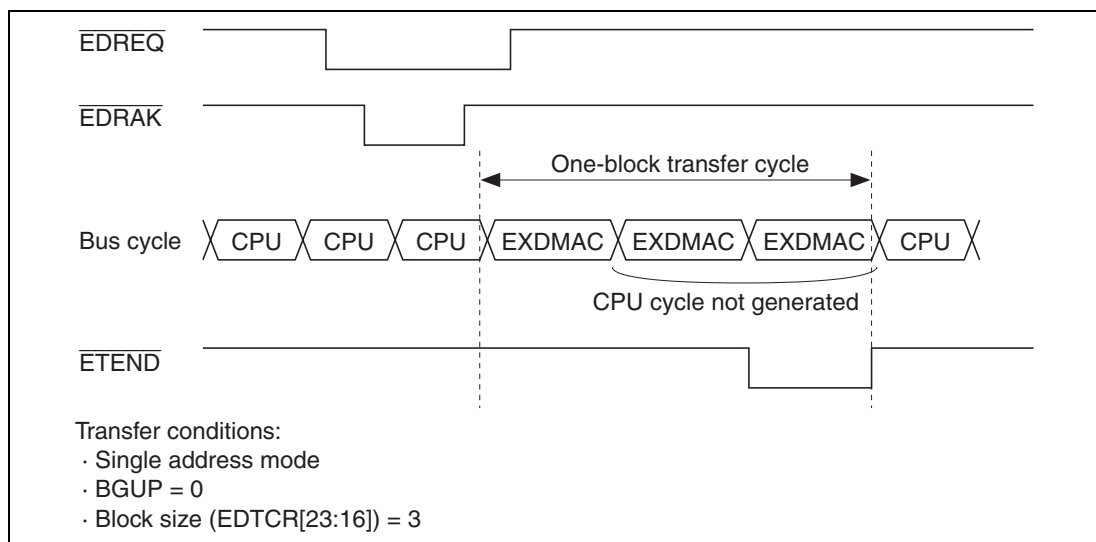

Address register values are updated in the same way as in normal mode. There is no function for restoring the initial address register values after each block transfer.

The  $\overline{\text{ETEND}}$  signal is output for each block transfer in the DMA transfer cycle in which the block ends. The  $\overline{\text{EDRAK}}$  signal is output once for one transfer request (for transfer of one block).

Caution is required when setting the repeat area overflow interrupt of the repeat area function in block transfer mode. See section 8.4.6, Repeat Area Function, for details.

Block transfer is aborted if an NMI interrupt is generated. See section 8.4.12, Ending DMA Transfer, for details.

Figure 8.8 shows an example of DMA transfer timing in block transfer mode.

**Figure 8.8 Example of Timing in Block Transfer Mode**

### 8.4.6 Repeat Area Function

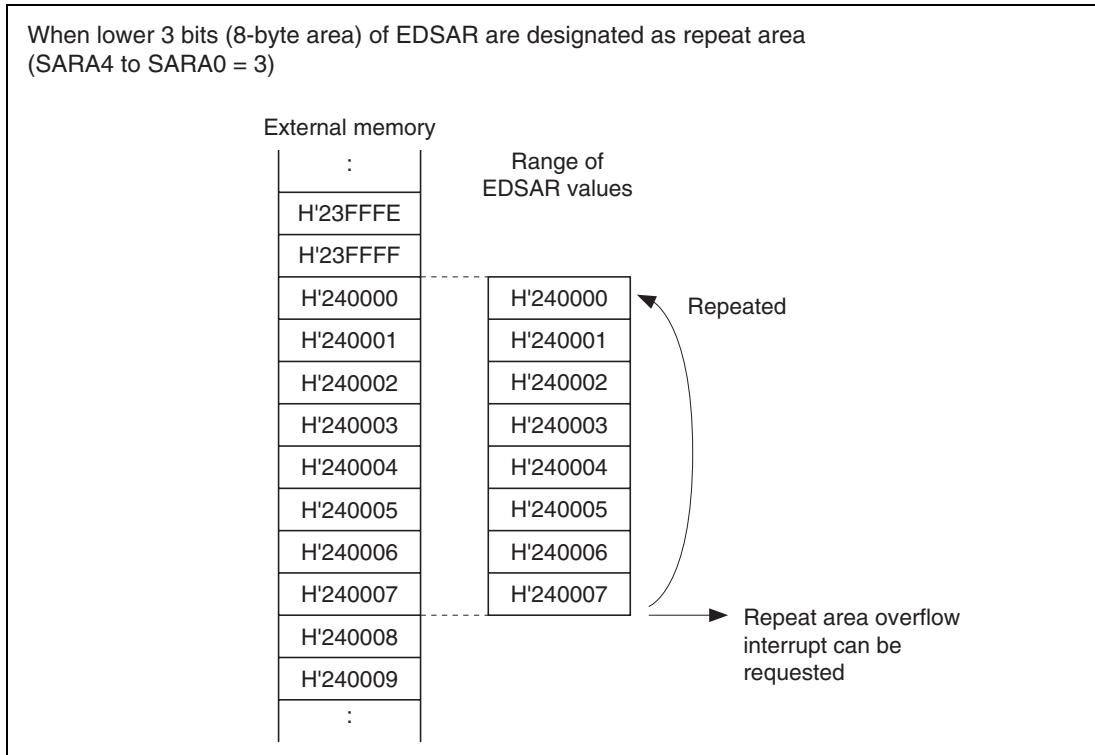

The EXDMAC has a function for designating a repeat area for source addresses and/or destination addresses. When a repeat area is designated, the address register values repeat within the range specified as the repeat area. Normally, when a ring buffer is involved in a transfer, an operation is required to restore the address register value to the buffer start address each time the address register value is the last address in the buffer (i.e. when ring buffer address overflow occurs), but if the repeat area function is used, the operation that restores the address register value to the buffer start address is performed automatically within the EXDMAC.

The repeat area function can be set independently for the source address register and the destination address register.

The source address repeat area is specified by bits SARA4 to SARA0 in EDACR, and the destination address repeat area by bits DARA4 to DARA0 in EDACR. The size of each repeat area can be specified independently.

When the address register value is the last address in the repeat area and repeat area overflow occurs, DMA transfer can be temporarily halted and an interrupt request sent to the CPU. If the SARIE bit in EDACR is set to 1, when the source address register overflows the repeat area, the IRF bit is set to 1 and the EDA bit cleared to 0 in EDMDR, and transfer is terminated. If EDIE = 1 in EDMDR, an interrupt is requested. If the DARIE bit in EDACR is set to 1, the above applies to the destination address register.

If the EDA bit in EDMDR is set to 1 during interrupt generation, transfer is resumed. Figure 8.9 illustrates the operation of the repeat area function.

**Figure 8.9 Example of Repeat Area Function Operation**

Caution is required when the repeat area overflow interrupt function is used together with block transfer mode. If transfer is always terminated when repeat area overflow occurs in block transfer mode, the block size must be a power of two, or alternatively, the address register value must be set so that the end of a block coincides with the end of the repeat area range.

If repeat area overflow occurs while a block is being transferred in block transfer mode, the repeat interrupt request is held pending until the end of the block, and transfer overrun will occur. Figure 8.10 shows an example in which block transfer mode is used together with the repeat area function.

When lower 3 bits (8-byte area) of EDSAR are designated as repeat area (SARA4 to SARA0 = 3), and block size of 5 (EDTCR[23–16] = 5) is set in block transfer mode

**Figure 8.10 Example of Repeat Area Function Operation in Block Transfer Mode**

## 8.4.7 Registers during DMA Transfer Operation

EXDMAC register values are updated as DMA transfer processing is performed. The updated values depend on various settings and the transfer status. The following registers and bits are updated: EDSAR, EDDAR, EDTCR, and bits EDA, BEF, and IRF in EDMDR,

### (1) EXDMA Source Address Register (EDSAR)

When the EDSAR address is accessed as the transfer source, after the EDSAR value is output, EDSAR is updated with the address to be accessed next. Bits SAT1 and SAT0 in EDACR specify incrementing or decrementing. The address is fixed when SAT1 = 0, incremented when SAT1 = 1 and SAT0 = 0, and decremented when SAT1 = 1 and SAT0 = 1.

The size of the increment or decrement is determined by the size of the data transferred. When the DTSIZE bit in EDMDR = 0, the data is byte-size and the address is incremented or decremented by 1; when DTSIZE = 1, the data is word-size and the address is incremented or decremented by 2.

When a repeat area setting is made, the operation conforms to that setting. The upper part of the address set for the repeat area function is fixed, and is not affected by address updating.

When EDSAR is read during a transfer operation, a longword access must be used. During a transfer operation, EDSAR may be updated without regard to accesses from the CPU, and the correct values may not be read if the upper and lower words are read separately. In a longword access, the EXDMAC buffers the EDSAR value to ensure that the correct value is output.

Do not write to EDSAR for a channel on which a transfer operation is in progress.

### (2) EXDMA Destination Address Register (EDDAR)

When the EDDAR address is accessed as the transfer destination, after the EDDAR value is output, EDDAR is updated with the address to be accessed next. Bits DAT1 and DAT0 in EDACR specify incrementing or decrementing. The address is fixed when DAT1 = 0, incremented when DAT1 = 1 and DAT0 = 0, and decremented when DAT1 = 1 and DAT0 = 1.

The size of the increment or decrement is determined by the size of the data transferred. When the DTSIZE bit in EDMDR = 0, the data is byte-size and the address is incremented or decremented by 1; when DTSIZE = 1, the data is word-size and the address is incremented or decremented by 2.

When a repeat area setting is made, the operation conforms to that setting. The upper part of the address set for the repeat area function is fixed, and is not affected by address updating.

When EDDAR is read during a transfer operation, a longword access must be used. During a transfer operation, EDDAR may be updated without regard to accesses from the CPU, and the correct values may not be read if the upper and lower words are read separately. In a longword access, the EXDMAC buffers the EDDAR value to ensure that the correct value is output.

Do not write to EDDAR for a channel on which a transfer operation is in progress.

### **(3) EXDMA Transfer Count Register (EDTCR)**

When a DMA transfer is performed, the value in EDTCR is decremented by 1. However, when the EDTCR value is 0, transfers are not counted and the EDTCR value does not change.

EDTCR functions differently in block transfer mode. The upper 8 bits, EDTCR[23:16], are used to specify the block size, and their value does not change. The lower 16 bits, EDTCR[15:0], function as a transfer counter, the value of which is decremented by 1 when a DMA transfer is performed. However, when the EDTCR[15:0] value is 0, transfers are not counted and the EDTCR[15:0] value does not change.

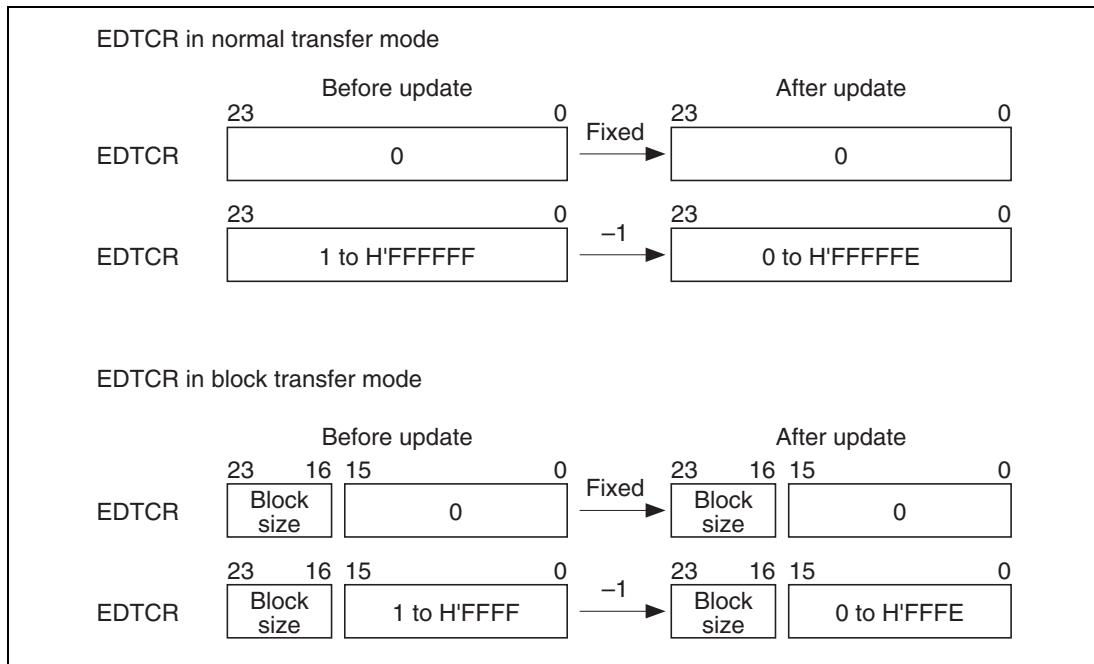

In normal transfer mode, all of the lower 24 bits of EDTCR may change, so when EDTCR is read by the CPU during DMA transfer, a longword access must be used. During a transfer operation, EDTCR may be updated without regard to accesses from the CPU, and the correct values may not be read if the upper and lower words are read separately. In a longword access, the EXDMAC buffers the EDTCR value to ensure that the correct value is output.

In block transfer mode, the upper 8 bits are never updated, so there is no problem with using word access.

Do not write to EDTCR for a channel on which a transfer operation is in progress. If there is contention between an address update associated with DMA transfer and a write by the CPU, the CPU write has priority.

In the event of contention between an EDTCR update from 1 to 0 and a write (of a nonzero value) by the CPU, the CPU write value has priority as the EDTCR value, but transfer is terminated. Transfer does not end if the CPU writes 0 to EDTCR.

Figure 8.11 shows EDTCR update operations in normal transfer mode and block transfer mode.

**Figure 8.11 EDTCR Update Operations in Normal Transfer Mode and Block Transfer Mode**

#### (4) EDA Bit in EDMDR

The EDA bit in EDMDR is written to by the CPU to control enabling and disabling of data transfer, but may be cleared automatically by the EXDMAC due to the DMA transfer status. There are also periods during transfer when a 0-write to the EDA bit by the CPU is not immediately effective.

Conditions for EDA bit clearing by the EXDMAC include the following:

- When the EDTCR value changes from 1 to 0, and transfer ends
- When a repeat area overflow interrupt is requested, and transfer ends
- When an NMI interrupt is generated, and transfer halts
- A reset
- Hardware standby mode
- When 0 is written to the EDA bit, and transfer halts

When transfer is halted by writing 0 to the EDA bit, the EDA bit remains at 1 during the DMA transfer period. In block transfer mode, since a block-size transfer is carried out without interruption, the EDA bit remains at 1 from the time 0 is written to it until the end of the current block-size transfer.

In burst mode, transfer is halted for up to three DMA transfers following the bus cycle in which 0 is written to the EDA bit. The EDA bit remains set to 1 from the time of the 0-write until the end of the last DMA cycle.

Writes (except to the EDA bit) are prohibited to registers of a channel for which the EDA bit is set to 1. When changing register settings after a 0-write to the EDA bit, it is necessary to confirm that the EDA bit has been cleared to 0.

Figure 8.12 shows the procedure for changing register settings in an operating channel.

**Figure 8.12 Procedure for Changing Register Settings in Operating Channel**

### (5) BEF Bit in EDMDR

In block transfer mode, the specified number of transfers (equivalent to the block size) is performed in response to a single transfer request. To ensure that the correct number of transfers is carried out, a block-size transfer is always executed, except in the event of a reset, transition to standby mode, or generation of an NMI interrupt.

If an NMI interrupt is generated during block transfer, operation is halted midway through a block-size transfer and the EDA bit is cleared to 0, terminating the transfer operation. In this case the BEF bit, which indicates the occurrence of an error during block transfer, is set to 1.

### (6) IRF Bit in EDMDR

The IRF bit in EDMDR is set to 1 when an interrupt request source occurs. If the EDIE bit in EDMDR is 1 at this time, an interrupt is requested.

The timing for setting the IRF bit to 1 is when the EDA bit in EDMDR is cleared to 0 and transfer ends following the end of the DMA transfer bus cycle in which the source generating the interrupt occurred.

If the EDA bit is set to 1 and transfer is resumed during interrupt handling, the IRF bit is automatically cleared to 0 and the interrupt request is cleared.

For details on interrupts, see section 8.5, Interrupt Sources.

## 8.4.8 Channel Priority Order

The priority order of the EXDMAC channels is: channel 2 > channel 3. Table 8.3 shows the EXDMAC channel priority order.

**Table 8.3 EXDMAC Channel Priority Order**

| Channel   | Priority |
|-----------|----------|
| Channel 2 | High     |
| Channel 3 | Low      |

If transfer requests occur simultaneously for a number of channels, the highest-priority channel according to the priority order in table 8.3 is selected for transfer.

### (1) Transfer Requests from Multiple Channels (Except Auto Request Cycle Steal Mode)

If transfer requests for different channels are issued during a transfer operation, the highest-priority channel (excluding the currently transferring channel) is selected. The selected channel begins transfer after the currently transferring channel releases the bus. If there is a bus request from a bus master other than the EXDMAC at this time, a cycle for the other bus master is initiated. If there is no other bus request, the bus is released for one cycle.

Channel switching does not take place during a burst transfer or a block transfer of a single block. Figure 8.13 shows a case in which transfer requests for channels 2 and 3 are issued simultaneously. The example shown in the figure illustrates the handling of external requests in the cycle steal mode.

**Figure 8.13 Example of Channel Priority Timing**

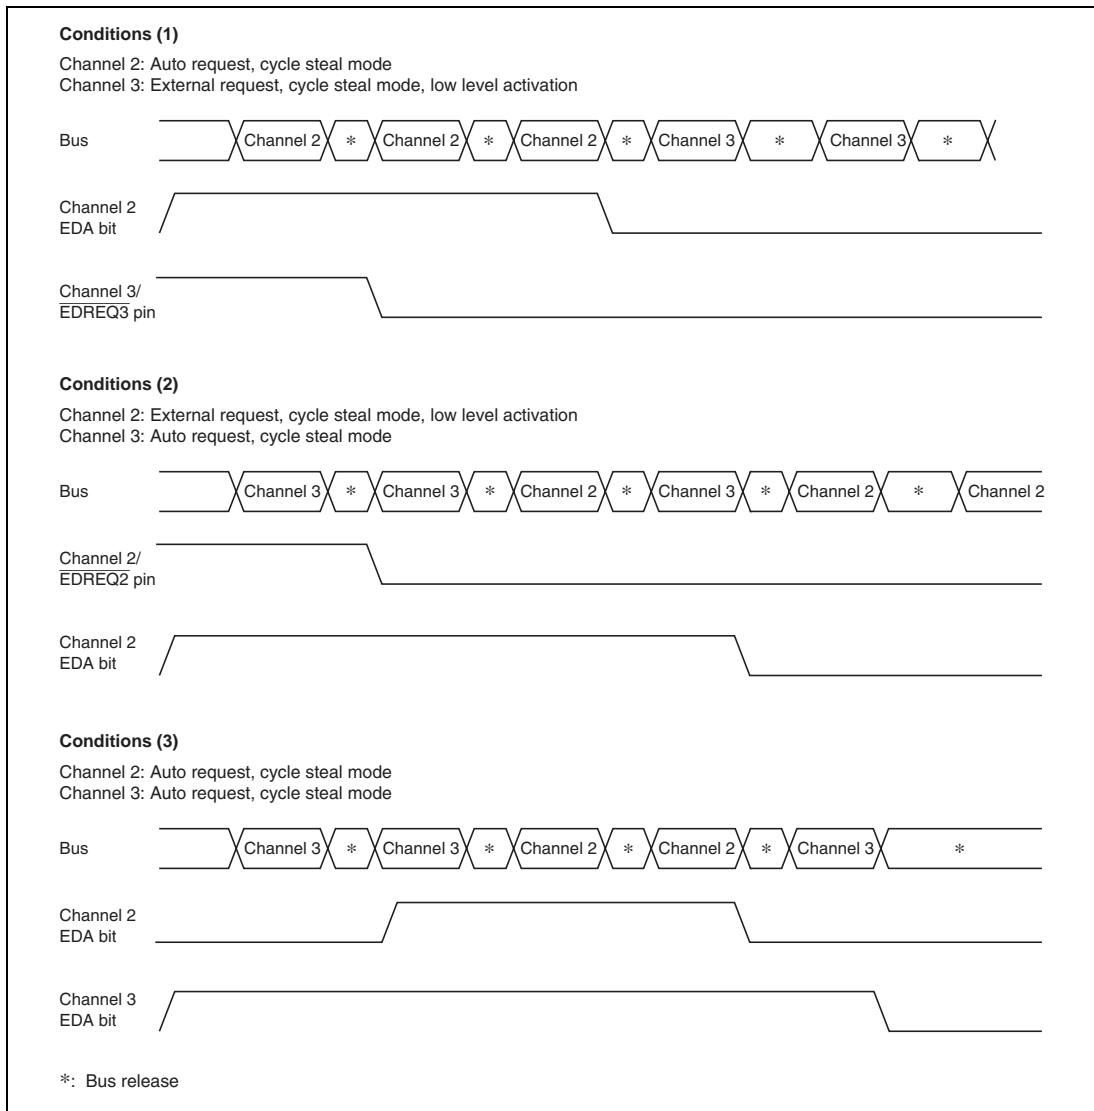

### (2) Transfer Requests from Multiple Channels in Auto Request Cycle Steal Mode

If transfer requests for different channels are issued during a transfer in auto request cycle steal mode, the operation depends on the channel priority. If the channel that made the transfer request is of higher priority than the channel currently performing transfer, the channel that made the transfer request is selected.

If the channel that made the transfer request is of lower priority than the channel currently performing transfer, that channel's transfer request is held pending, and the currently transferring channel remains selected.

The selected channel begins transfer after the currently transferring channel releases the bus. If there is a bus request from a bus master other than the EXDMAC at this time, a cycle for the other bus master is initiated. If there is no other bus request, the bus is released for one cycle.

Figure 8.14 shows examples of transfer timing in cases that include auto request cycle steal mode.

**Figure 8.14 Examples of Channel Priority Timing**

## 8.4.9 EXDMAC Bus Cycles (Dual Address Mode)

### (1) Normal Transfer Mode (Cycle Steal Mode)

Figure 8.15 shows an example of transfer when  $\overline{\text{ETEND}}$  output is enabled, and word-size, normal transfer mode (cycle steal mode) is performed from external 16-bit, 2-state access space to external 16-bit, 2-state access space.

After one byte or word has been transferred, the bus is released. While the bus is released, one CPU, DMAC, or DTC bus cycle is initiated.

**Figure 8.15 Example of Normal Transfer Mode (Cycle Steal Mode) Transfer**

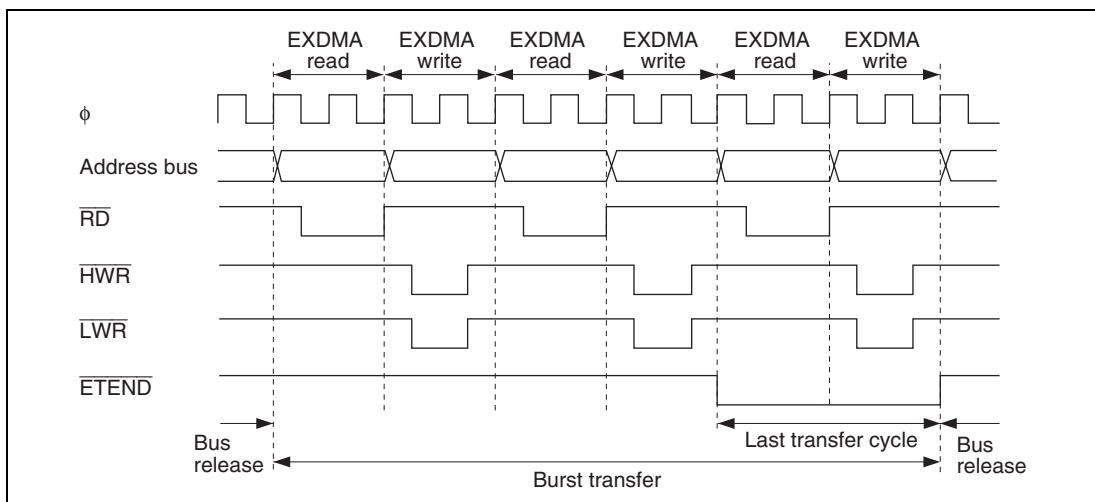

## (2) Normal Transfer Mode (Burst Mode)

Figure 8.16 shows an example of transfer when  $\overline{\text{ETEND}}$  output is enabled, and word-size, normal transfer mode (burst mode) is performed from external 16-bit, 2-state access space to external 16-bit, 2-state access space.

In burst mode, one-byte or one-word transfers are executed continuously until transfer ends.

Once burst transfer starts, requests from other channels, even of higher priority, are held pending until transfer ends.

**Figure 8.16 Example of Normal Transfer Mode (Burst Mode) Transfer**

If an NMI interrupt is generated while a channel designated for burst transfer is enabled for transfer, the EDA bit is cleared and transfer is disabled. If a block transfer has already been initiated within the EXDMAC, the bus is released on completion of the currently executing byte or word transfer, and burst transfer is aborted. If the last transfer cycle in burst transfer has been initiated within the EXDMAC, transfer is executed to the end even if the EDA bit is cleared.

### (3) Block Transfer Mode (Cycle Steal Mode)

Figure 8.17 shows an example of transfer when  $\overline{\text{ETEND}}$  output is enabled, and word-size, block transfer mode (cycle steal mode) is performed from external 16-bit, 2-state access space to external 16-bit, 2-state access space.

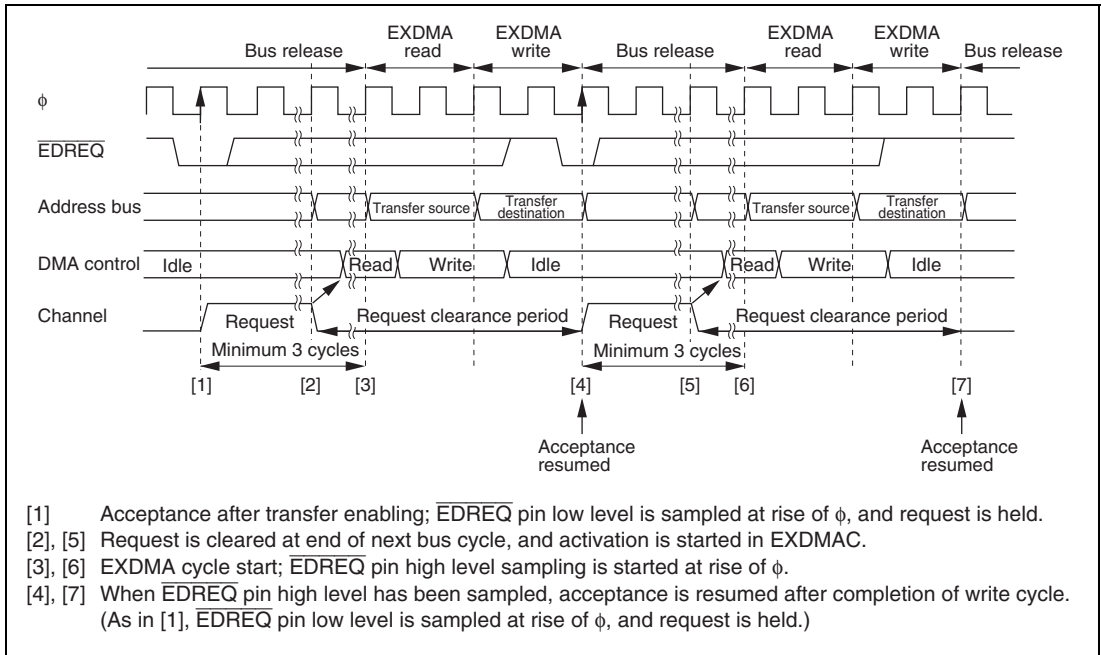

One block is transferred in response to one transfer request, and after the transfer, the bus is released. While the bus is released, one or more CPU, DMAC, or DTC bus cycles are initiated.

**Figure 8.17 Example of Block Transfer Mode (Cycle Steal Mode) Transfer**

#### (4) $\overline{\text{EDREQ}}$ Pin Falling Edge Activation Timing

Figure 8.18 shows an example of normal mode transfer activated by the  $\overline{\text{EDREQ}}$  pin falling edge.

**Figure 8.18 Example of Normal Mode Transfer Activated by  $\overline{\text{EDREQ}}$  Pin Falling Edge**

$\overline{\text{EDREQ}}$  pin sampling is performed in each cycle starting at the next rise of  $\phi$  after the end of the EXDMA write cycle for setting the transfer-enabled state.

When a low level is sampled at the  $\overline{\text{EDREQ}}$  pin while acceptance via the  $\overline{\text{EDREQ}}$  pin is possible, the request is held within the EXDMAC. Then when activation is initiated within the EXDMAC, the request is cleared, and  $\overline{\text{EDREQ}}$  pin high level sampling for edge sensing is started. If  $\overline{\text{EDREQ}}$  pin high level sampling is completed by the end of the EXDMA write cycle, acceptance resumes after the end of the write cycle, and  $\overline{\text{EDREQ}}$  pin low level sampling is performed again; this sequence of operations is repeated until the end of the transfer.

Figure 8.19 shows an example of block transfer mode transfer activated by the  $\overline{\text{EDREQ}}$  pin falling edge.

**Figure 8.19 Example of Block Transfer Mode Transfer Activated by  $\overline{\text{EDREQ}}$  Pin Falling Edge**

$\overline{\text{EDREQ}}$  pin sampling is performed in each cycle starting at the next rise of  $\phi$  after the end of the EXDMAC write cycle for setting the transfer-enabled state.

When a low level is sampled at the  $\overline{\text{EDREQ}}$  pin while acceptance via the  $\overline{\text{EDREQ}}$  pin is possible, the request is held within the EXDMAC. Then when activation is initiated within the EXDMAC, the request is cleared, and  $\overline{\text{EDREQ}}$  pin high level sampling for edge sensing is started. If  $\overline{\text{EDREQ}}$  pin high level sampling is completed by the end of the EXDMA write cycle, acceptance resumes after the end of the write cycle, and  $\overline{\text{EDREQ}}$  pin low level sampling is performed again; this sequence of operations is repeated until the end of the transfer.

## (5) $\overline{\text{EDREQ}}$ Pin Low Level Activation Timing

Figure 8.20 shows an example of normal mode transfer activated by the  $\overline{\text{EDREQ}}$  pin low level.

**Figure 8.20 Example of Normal Mode Transfer Activated by  $\overline{\text{EDREQ}}$  Pin Low Level**

$\overline{\text{EDREQ}}$  pin sampling is performed in each cycle starting at the next rise of  $\phi$  after the end of the EXDMAC write cycle for setting the transfer-enabled state.

When a low level is sampled at the  $\overline{\text{EDREQ}}$  pin while acceptance via the  $\overline{\text{EDREQ}}$  pin is possible, the request is held within the EXDMAC. Then when activation is initiated within the EXDMAC, the request is cleared. At the end of the write cycle, acceptance resumes and  $\overline{\text{EDREQ}}$  pin low level sampling is performed again; this sequence of operations is repeated until the end of the transfer.

Figure 8.21 shows an example of block transfer mode transfer activated by the  $\overline{\text{EDREQ}}$  pin low level.

**Figure 8.21 Example of Block Transfer Mode Transfer Activated by  $\overline{\text{EDREQ}}$  Pin Low Level**

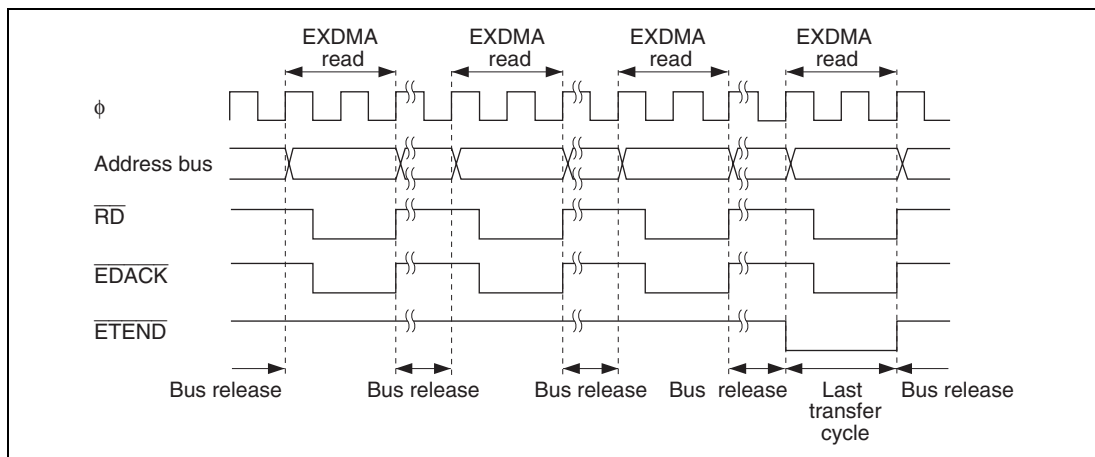

$\overline{\text{EDREQ}}$  pin sampling is performed in each cycle starting at the next rise of  $\phi$  after the end of the EDMDR write cycle for setting the transfer-enabled state.

When a low level is sampled at the  $\overline{\text{EDREQ}}$  pin while acceptance via the  $\overline{\text{EDREQ}}$  pin is possible, the request is held within the EXDMAC. Then when activation is initiated within the EXDMAC, the request is cleared. At the end of the write cycle, acceptance resumes and  $\overline{\text{EDREQ}}$  pin low level sampling is performed again; this sequence of operations is repeated until the end of the transfer.

### 8.4.10 EXDMAC Bus Cycles (Single Address Mode)

#### (1) Single Address Mode (Read)

Figure 8.22 shows an example of transfer when  $\overline{\text{ETEND}}$  output is enabled, and byte-size, single address mode transfer (read) is performed from external 8-bit, 2-state access space to an external device.

**Figure 8.22 Example of Single Address Mode (Byte Read) Transfer**

Figure 8.23 shows an example of transfer when  $\overline{\text{ETEND}}$  output is enabled, and word-size, single address mode transfer (read) is performed from external 8-bit, 2-state access space to an external device.

**Figure 8.23 Example of Single Address Mode (Word Read) Transfer**

After one byte or word has been transferred in response to one transfer request, the bus is released. While the bus is released, one or more CPU, DMAC, or DTC bus cycles are initiated.

## (2) Single Address Mode (Write)

Figure 8.24 shows an example of transfer when  $\overline{ETEND}$  output is enabled, and byte-size, single address mode transfer (write) is performed from an external device to external 8-bit, 2-state access space.

**Figure 8.24 Example of Single Address Mode (Byte Write) Transfer**

Figure 8.25 shows an example of transfer when  $\overline{\text{ETEND}}$  output is enabled, and word-size, single address mode transfer (write) is performed from an external device to external 8-bit, 2-state access space.

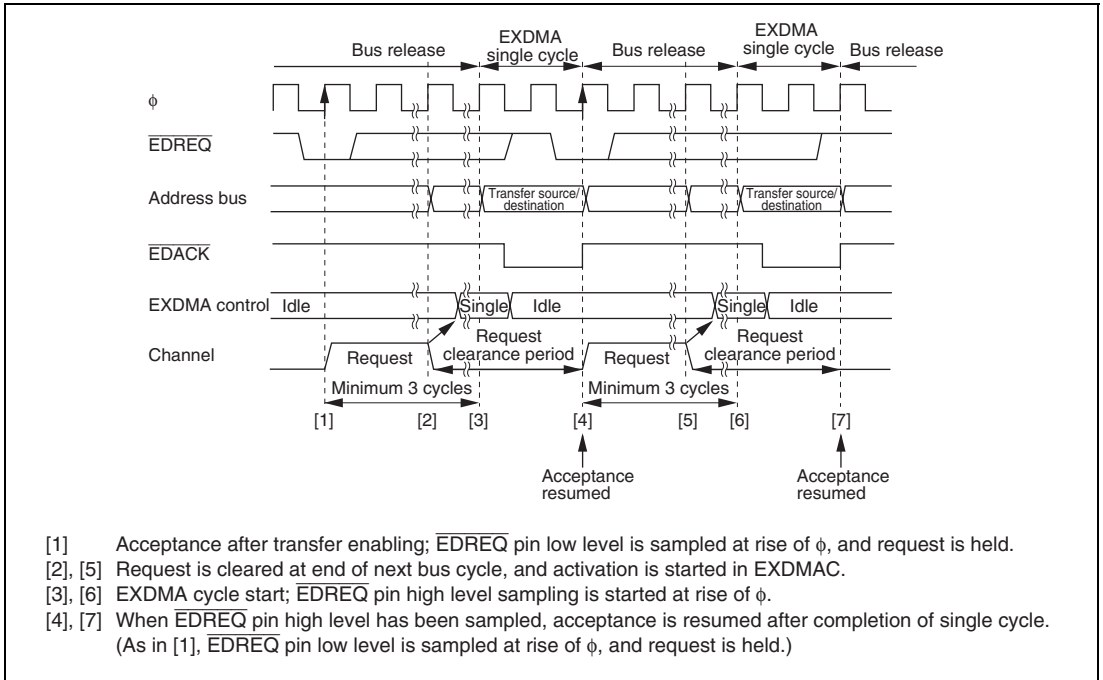

**Figure 8.25 Example of Single Address Mode (Word Write) Transfer**

After one byte or word has been transferred in response to one transfer request, the bus is released. While the bus is released, one or more CPU, DMAC, or DTC bus cycles are initiated.

### (3) $\overline{\text{EDREQ}}$ Pin Falling Edge Activation Timing

Figure 8.26 shows an example of single address mode transfer activated by the  $\overline{\text{EDREQ}}$  pin falling edge.

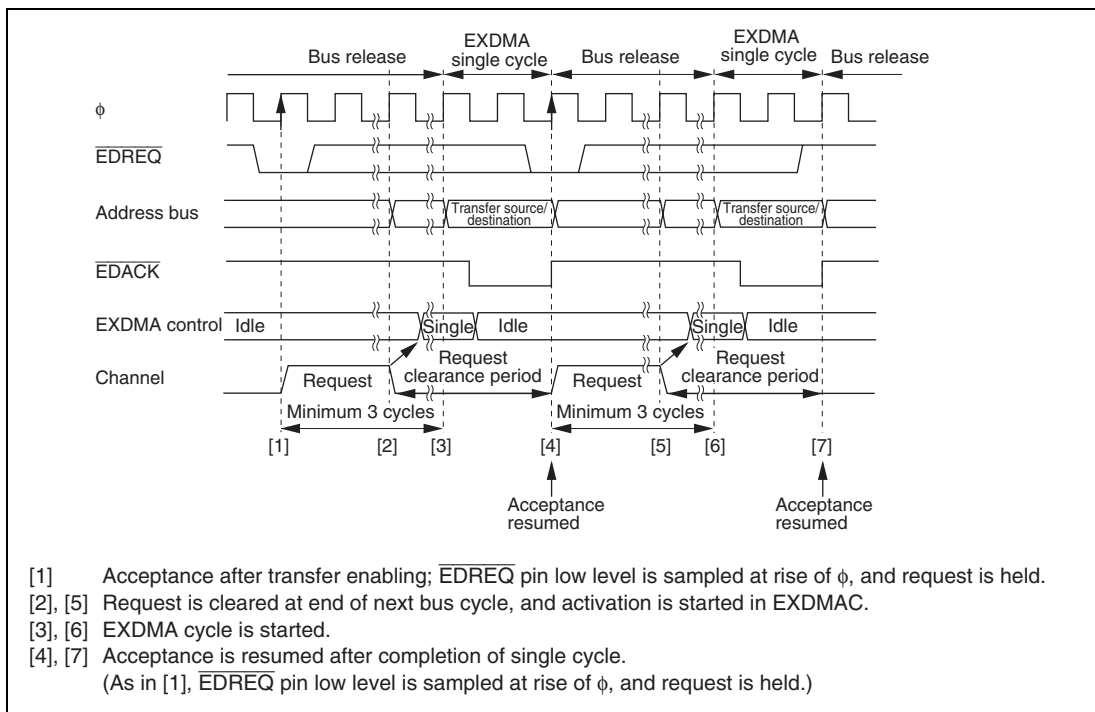

**Figure 8.26 Example of Single Address Mode Transfer Activated by  $\overline{\text{EDREQ}}$  Pin Falling Edge**

$\overline{\text{EDREQ}}$  pin sampling is performed in each cycle starting at the next rise of  $\phi$  after the end of the EXMDR write cycle for setting the transfer-enabled state.

When a low level is sampled at the  $\overline{\text{EDREQ}}$  pin while acceptance via the  $\overline{\text{EDREQ}}$  pin is possible, the request is held within the EXDMAC. Then when activation is initiated within the EXDMAC, the request is cleared, and  $\overline{\text{EDREQ}}$  pin high level sampling for edge sensing is started. If  $\overline{\text{EDREQ}}$  pin high level sampling is completed by the end of the EXDMA single cycle, acceptance resumes after the end of the single cycle, and  $\overline{\text{EDREQ}}$  pin low level sampling is performed again; this sequence of operations is repeated until the end of the transfer.

#### (4) $\overline{\text{EDREQ}}$ Pin Low Level Activation Timing

Figure 8.27 shows an example of single address mode transfer activated by the  $\overline{\text{EDREQ}}$  pin low level.

**Figure 8.27 Example of Single Address Mode Transfer Activated by  $\overline{\text{EDREQ}}$  Pin Low Level**

$\overline{\text{EDREQ}}$  pin sampling is performed in each cycle starting at the next rise of  $\phi$  after the end of the EDMDR write cycle for setting the transfer-enabled state.

When a low level is sampled at the  $\overline{\text{EDREQ}}$  pin while acceptance via the  $\overline{\text{EDREQ}}$  pin is possible, the request is held within the EXDMAC. Then when activation is initiated within the EXDMAC, the request is cleared. At the end of the single cycle, acceptance resumes and  $\overline{\text{EDREQ}}$  pin low level sampling is performed again; this sequence of operations is repeated until the end of the transfer.

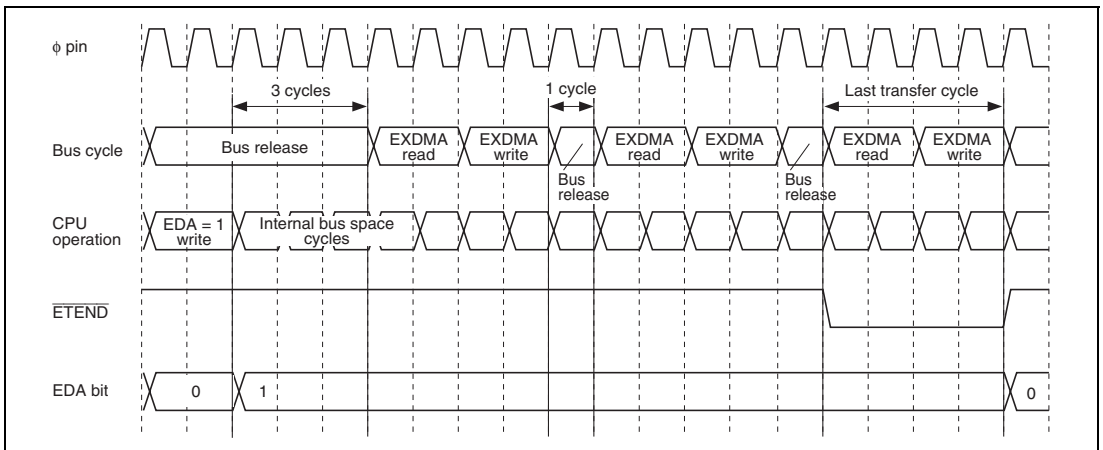

### 8.4.11 Examples of Operation Timing in Each Mode

#### (1) Auto Request/Cycle Steal Mode/Normal Transfer Mode

When the EDA bit is set to 1 in EDMDR, an EXDMA transfer cycle is started a minimum of three cycles later. There is a one-cycle bus release interval between the end of a one-transfer-unit EXDMA cycle and the start of the next transfer.

If there is a transfer request for another channel of higher priority, the transfer request by the original channel is held pending, and transfer is performed on the higher-priority channel from the next transfer. Transfer on the original channel is resumed on completion of the higher-priority channel transfer.

Figures 8.28 to 8.30 show operation timing examples for various conditions.

**Figure 8.28 Auto Request/Cycle Steal Mode/Normal Transfer Mode  
(No Contention/Dual Address Mode)**

**Figure 8.29 Auto Request/Cycle Steal Mode/Normal Transfer Mode (CPU Cycles/Single Address Mode)**

**Figure 8.30 Auto Request/Cycle Steal Mode/Normal Transfer Mode (Contention with Another Channel/Single Address Mode)**

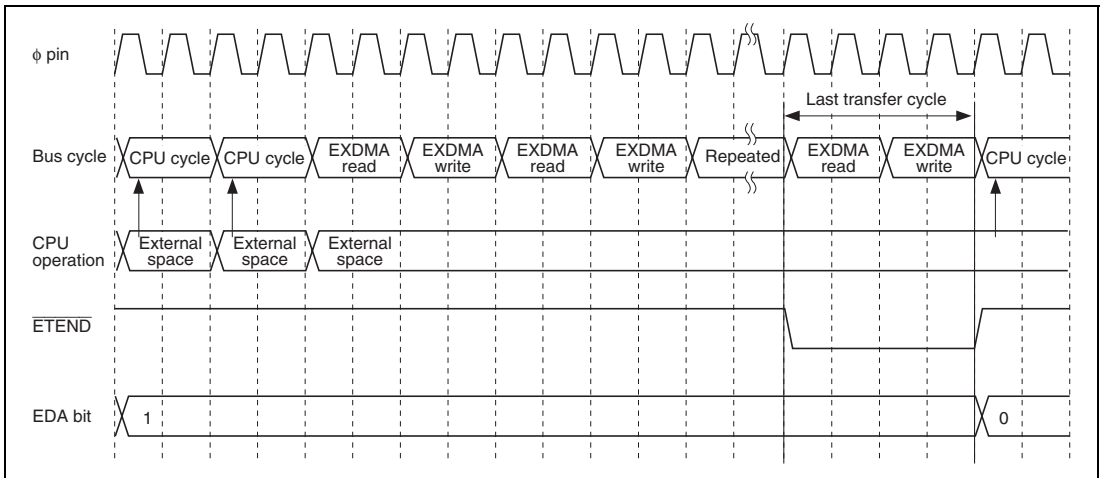

## (2) Auto Request/Burst Mode/Normal Transfer Mode

When the EDA bit is set to 1 in EDMDR, an EXDMA transfer cycle is started a minimum of three cycles later. Once transfer is started, it continues (as a burst) until the transfer end condition is satisfied.

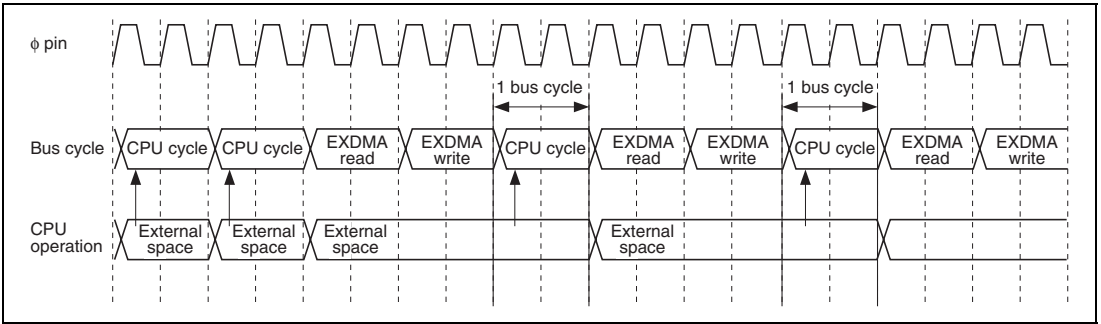

If the BGUP bit is 1 in EDMDR, the bus is transferred in the event of a bus request from another bus master.

Transfer requests for other channels are held pending until the end of transfer on the current channel.

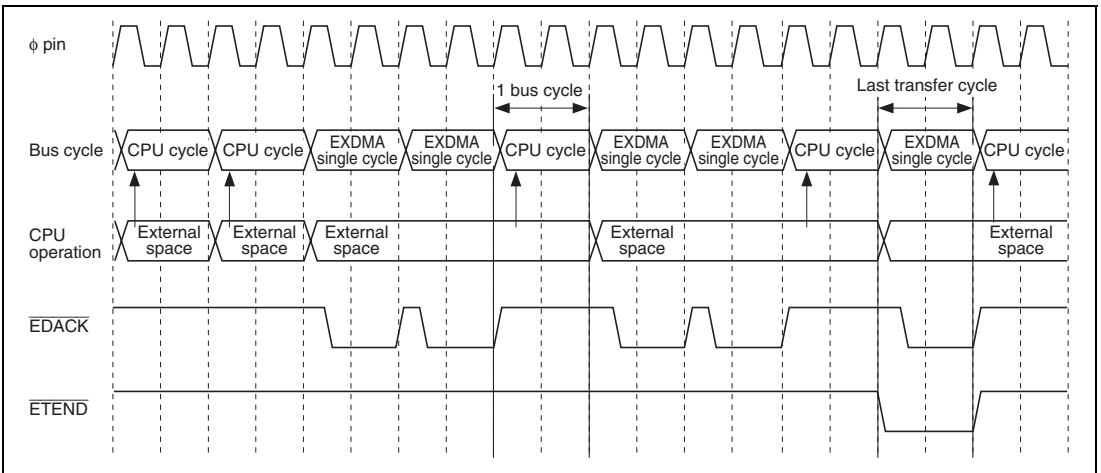

Figures 8.31 to 8.34 show operation timing examples for various conditions.

**Figure 8.31 Auto Request/Burst Mode/Normal Transfer Mode  
(CPU Cycles/Dual Address Mode/BGUP = 0)**

**Figure 8.32 Auto Request/Burst Mode/Normal Transfer Mode  
(CPU Cycles/Dual Address Mode/BGUP = 1)**

**Figure 8.33 Auto Request/Burst Mode/Normal Transfer Mode  
(CPU Cycles/Single Address Mode/BGUP = 1)**

**Figure 8.34 Auto Request/Burst Mode/Normal Transfer Mode  
(Contention with Another Channel/Single Address Mode)**

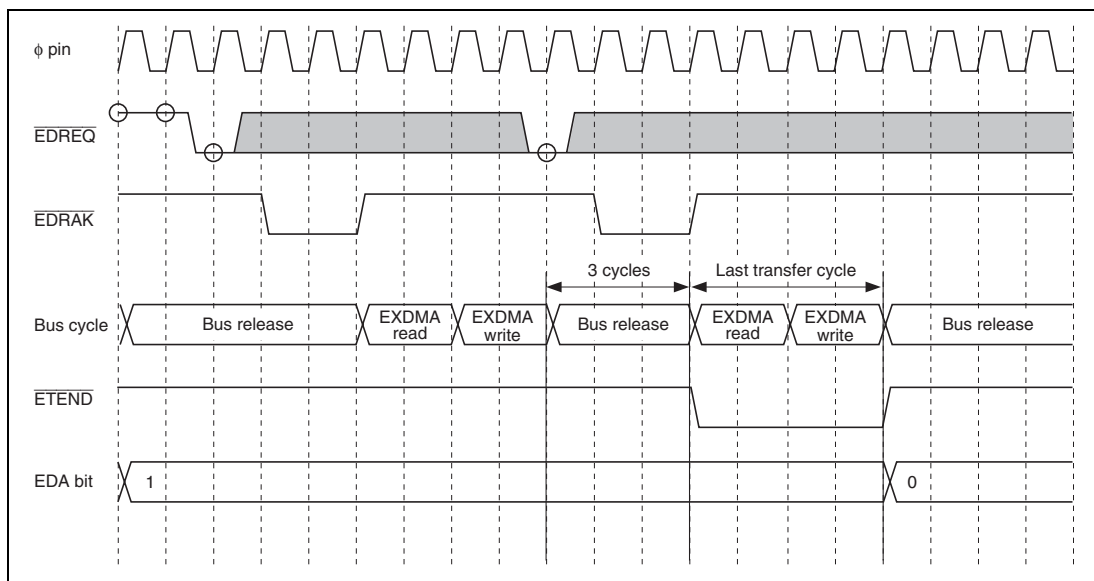

### (3) External Request/Cycle Steal Mode/Normal Transfer Mode

In external request mode, an EXDMA transfer cycle is started a minimum of three cycles after a transfer request is accepted. The next transfer request is accepted after the end of a one-transfer-unit EXDMA cycle. For external bus space CPU cycles, at least two bus cycles are generated before the next EXDMA cycle.

If a transfer request is generated for another channel, an EXDMA cycle for the other channel is generated before the next EXDMA cycle.

The  $\overline{\text{EDREQ}}$  pin sensing timing is different for low level sensing and falling edge sensing. The same applies to transfer request acceptance and transfer start timing.

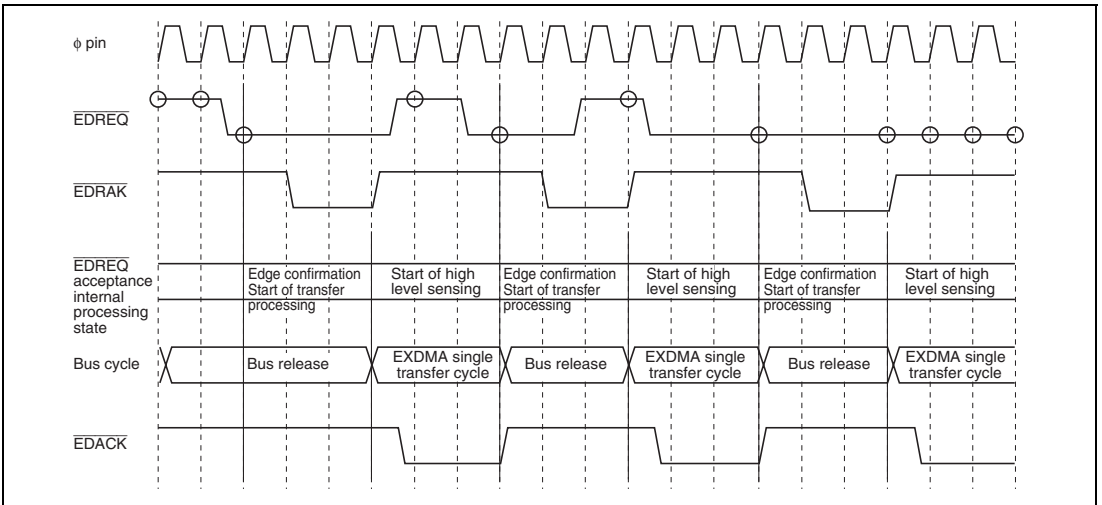

Figures 8.35 to 8.38 show operation timing examples for various conditions.

**Figure 8.35 External Request/Cycle Steal Mode/Normal Transfer Mode  
(No Contention/Dual Address Mode/Low Level Sensing)**

**Figure 8.36 External Request/Cycle Steal Mode/Normal Transfer Mode (CPU Cycles/Single Address Mode/Low Level Sensing)**

**Figure 8.37 External Request/Cycle Steal Mode/Normal Transfer Mode (No Contention/Single Address Mode/Falling Edge Sensing)**

**Figure 8.38 External Request/Cycle Steal Mode/Normal Transfer Mode Contention with Another Channel/Dual Address Mode/Low Level Sensing**

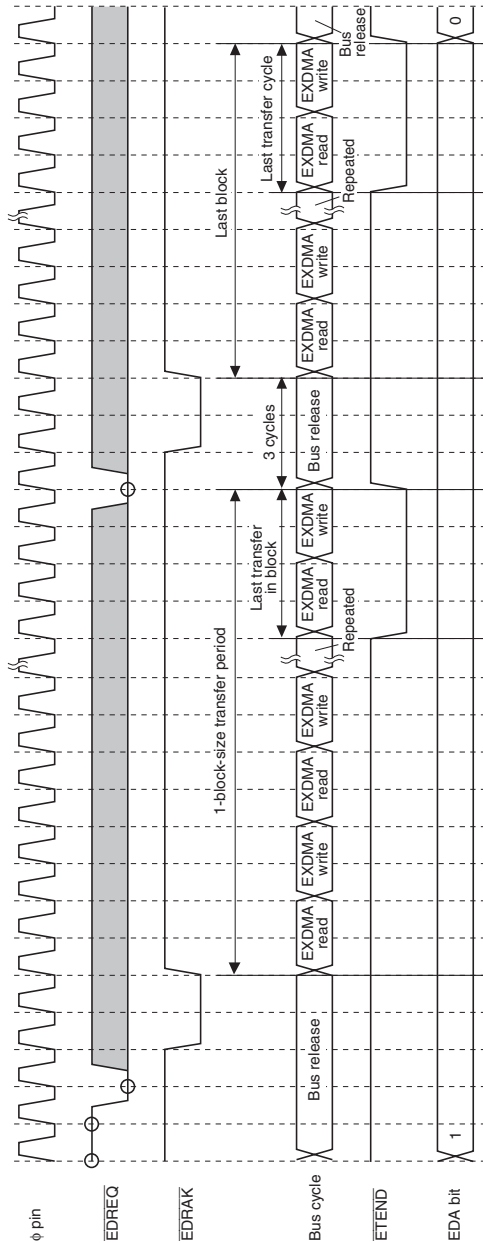

#### (4) External Request/Cycle Steal Mode/Block Transfer Mode

In block transfer mode, transfer of one block is performed continuously in the same way as in burst mode. The timing of the start of the next block transfer is the same as in normal transfer mode.

If a transfer request is generated for another channel, an EXDMA cycle for the other channel is generated before the next block transfer.

The  $\overline{\text{EDREQ}}$  pin sensing timing is different for low level sensing and falling edge sensing. The same applies to transfer request acceptance and transfer start timing.

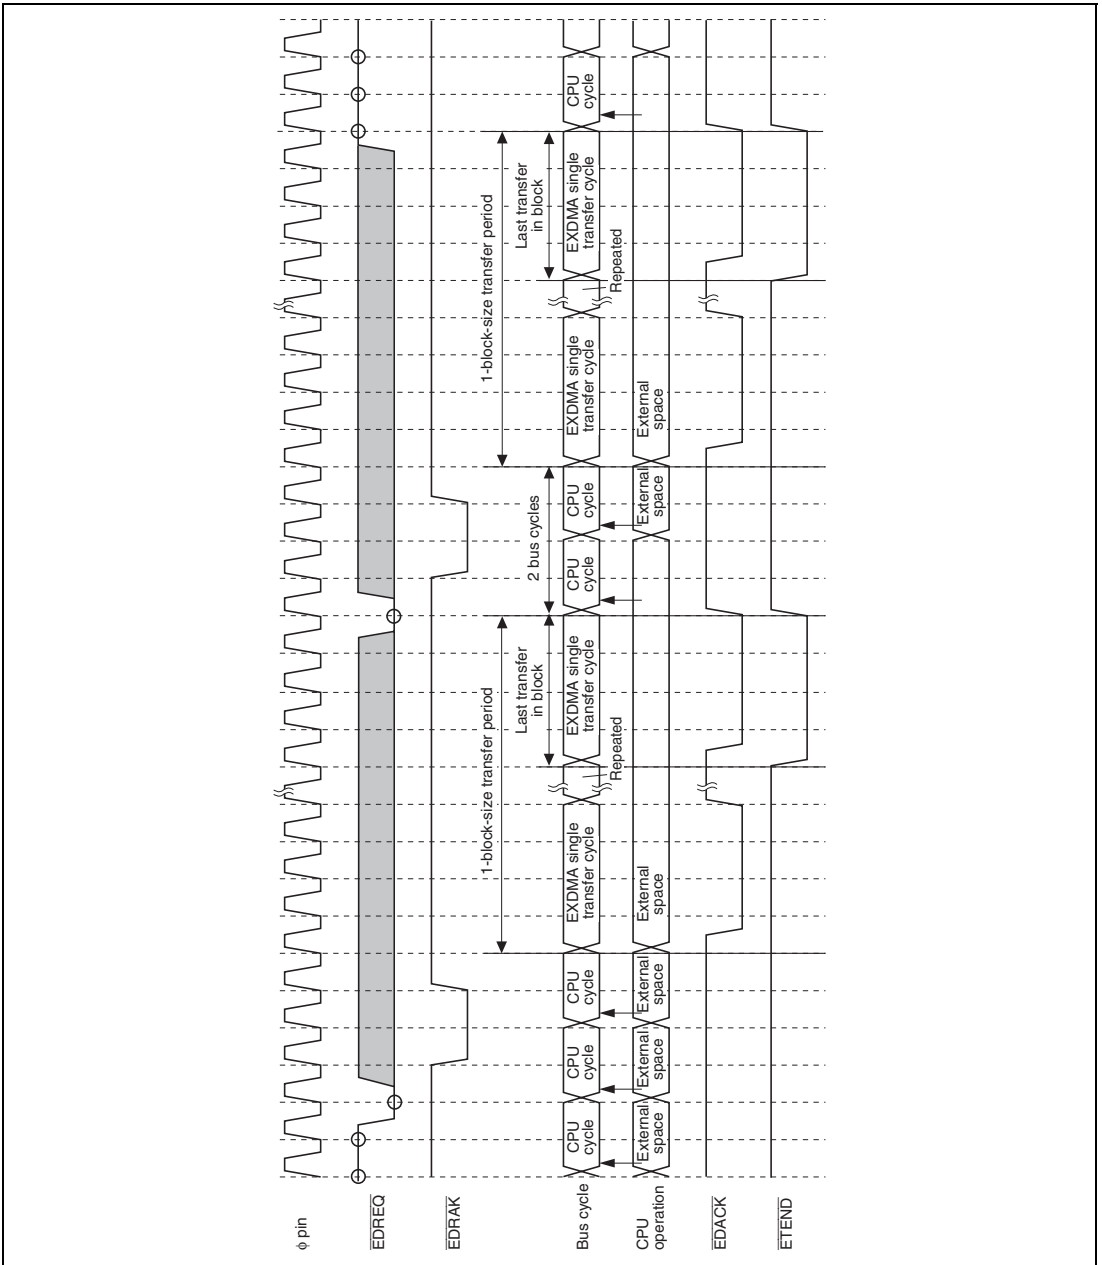

Figures 8.39 to 8.44 show operation timing examples for various conditions.

**Figure 8.39 External Request/Cycle Steal Mode/Block Transfer Mode  
(No Contention/Dual Address Mode/Low Level Sensing/BGUP = 0)**

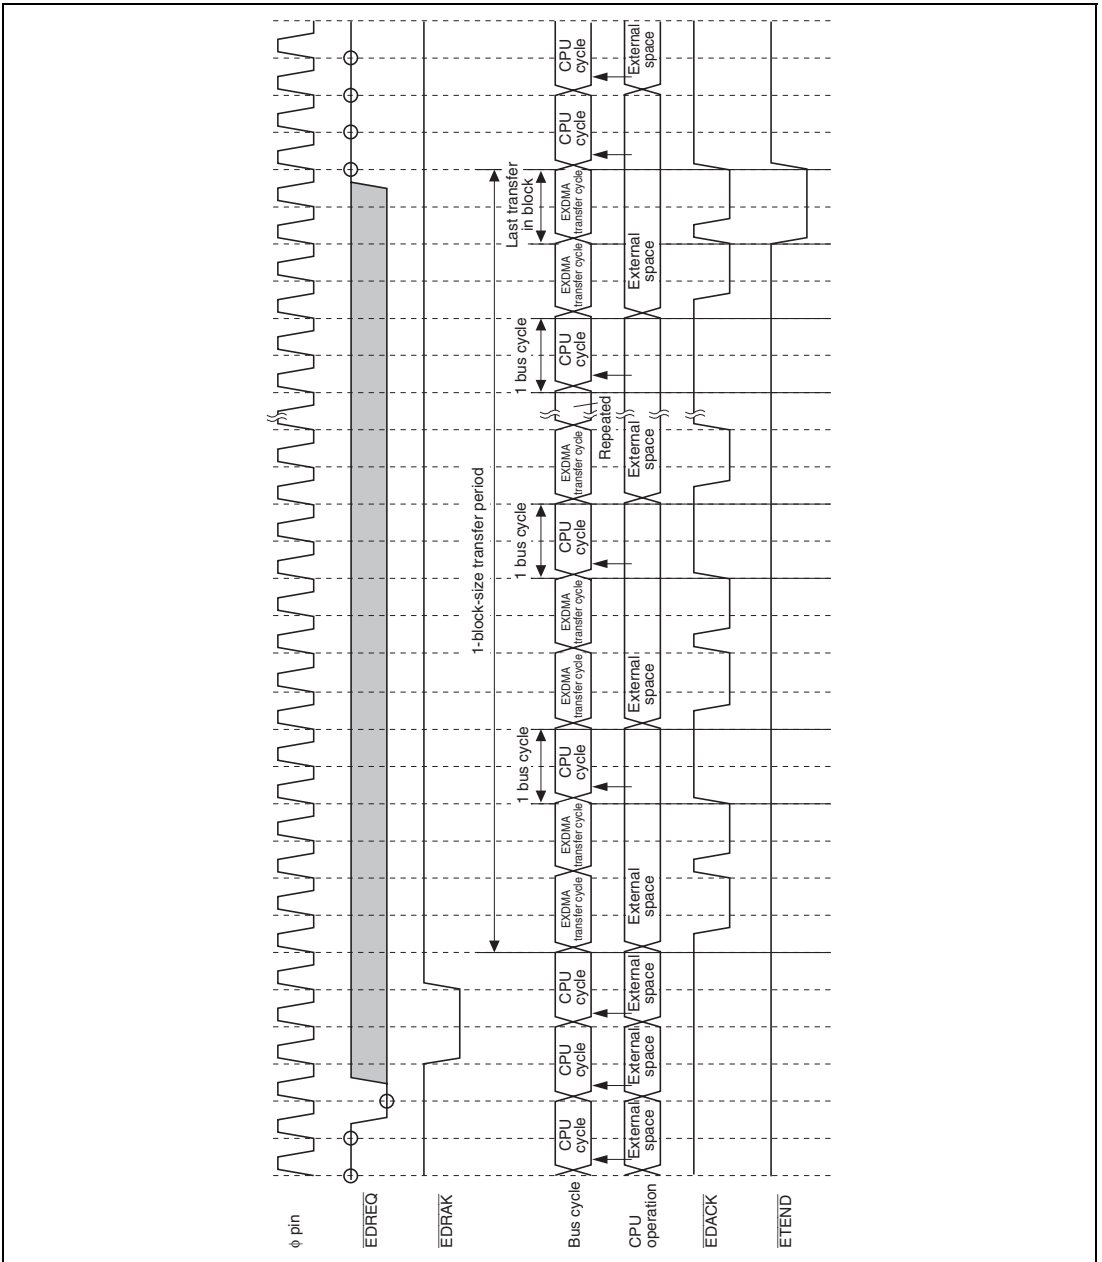

**Figure 8.40 External Request/Cycle Steal Mode/Block Transfer Mode  
(No Contention/Single Address Mode/Falling Edge Sensing/BGUP = 0)**

**Figure 8.41 External Request/Cycle Steal Mode/Block Transfer Mode  
(CPU Cycles/Single Address Mode/Low Level Sensing/BGUP = 0)**

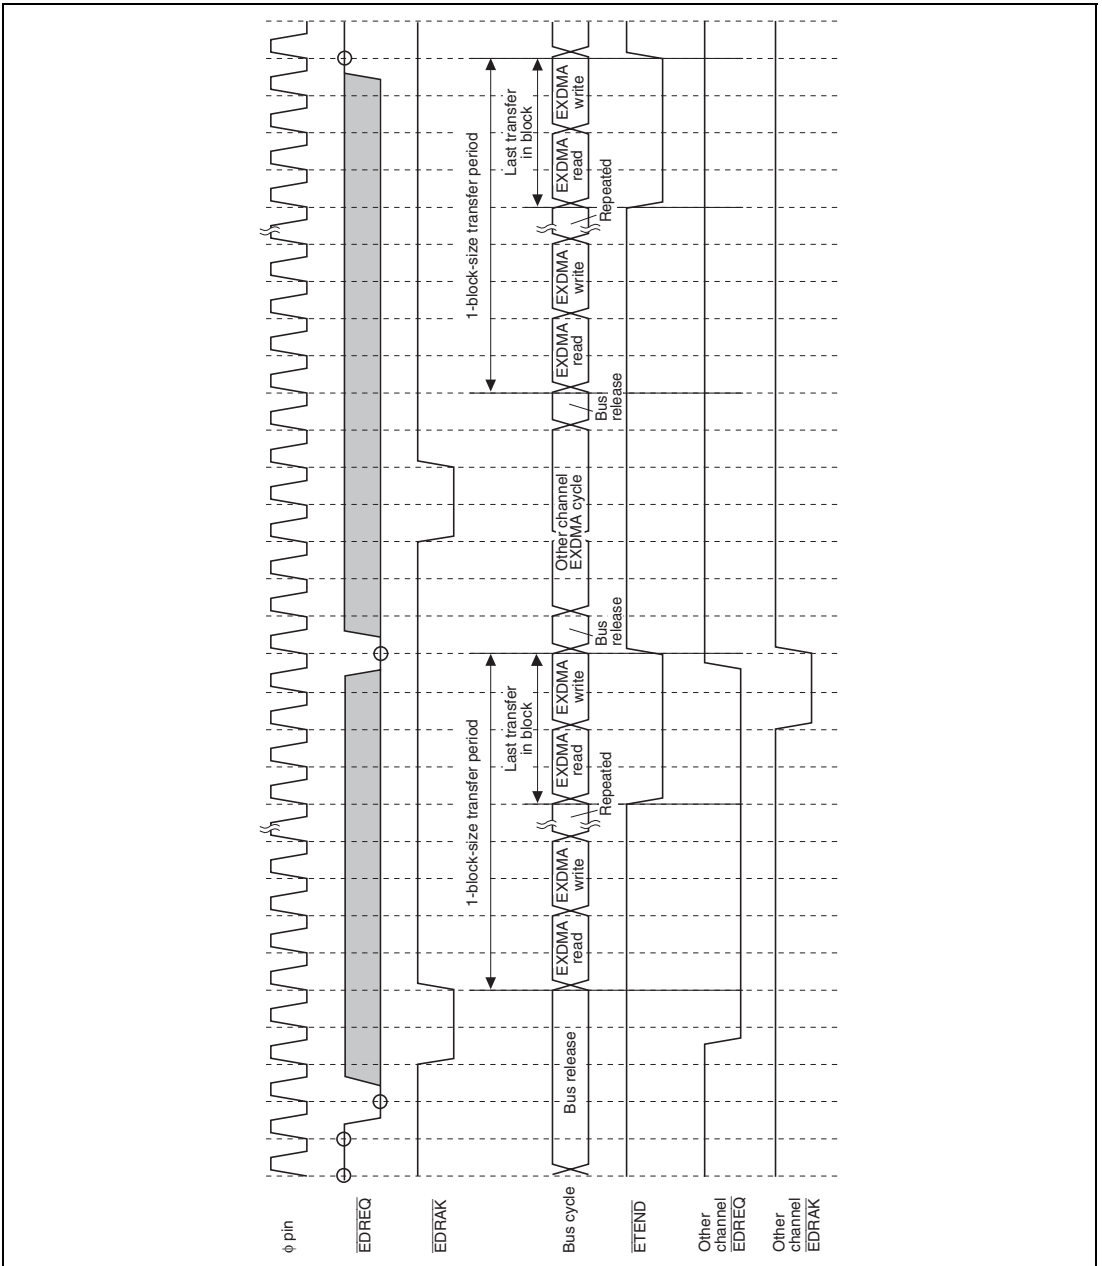

**Figure 8.42 External Request/Cycle Steal Mode/Block Transfer Mode  
(CPU Cycles/Dual Address Mode/Low Level Sensing/BGUP = 1)**

**Figure 8.43 External Request/Cycle Steal Mode/Block Transfer Mode  
(CPU Cycles/Single Address Mode/Low Level Sensing/BGUP = 1)**

**Figure 8.44 External Request/Cycle Steal Mode/Block Transfer Mode  
(Contention with Another Channel/Dual Address Mode/Low Level Sensing)**

### 8.4.12 Ending DMA Transfer

The operation for ending DMA transfer depends on the transfer end conditions. When DMA transfer ends, the EDA bit in EDMDR changes from 1 to 0, indicating that DMA transfer has ended.

#### (1) Transfer End by 1 → 0 Transition of EDTCR

When the value of EDTCR changes from 1 to 0, DMA transfer ends on the corresponding channel and the EDA bit in EDMDR is cleared to 0. If the TCEIE bit in EDMDR is set at this time, a transfer end interrupt request is generated by the transfer counter and the IRF bit in EDMDR is set to 1.

In block transfer mode, DMA transfer ends when the value of bits 15 to 0 in EDTCR changes from 1 to 0.

DMA transfer does not end if the EDTCR value has been 0 since before the start of transfer.

#### (2) Transfer End by Repeat Area Overflow Interrupt

If an address overflows the repeat area when a repeat area specification has been made and repeat interrupts have been enabled (with the SARIE or DARIE bit in EDACR), a repeat area overflow interrupt is requested. DMA transfer ends, the EDA bit in EDMDR is cleared to 0, and the IRF bit in EDMDR is set to 1.

In dual address mode, if a repeat area overflow interrupt is requested during a read cycle, the following write cycle processing is still executed.

In block transfer mode, if a repeat area overflow interrupt is requested during transfer of a block, transfer continues to the end of the block. Transfer end by means of a repeat area overflow interrupt occurs between block-size transfers.

#### (3) Transfer End by 0-Write to EDA Bit in EDMDR

When 0 is written to the EDA bit in EDMDR by the CPU, etc., transfer ends after completion of the DMA cycle in which transfer is in progress or a transfer request was accepted.

In block transfer mode, DMA transfer halts after completion of one-block-size transfer.

The EDA bit in EDMDR is not cleared to 0 until all transfer processing has ended. Up to that point, the value of the EDA bit will be read as 1.

#### (4) Transfer Abort by NMI Interrupt

DMA transfer is aborted when an NMI interrupt is generated. The EDA bit is cleared to 0 in all channels. In external request mode, DMA transfer is performed for all transfer requests for which EDRAK has been output. In dual address mode, processing is executed for the write cycle following the read cycle.

In block transfer mode, operation is aborted even in the middle of a block-size transfer. As the transfer is halted midway through a block, the BEF bit in EDMDR is set to 1 to indicate that the block transfer was not carried out normally.

When transfer is aborted, register values are retained, and as the address registers indicate the next transfer addresses, transfer can be resumed by setting the EDA bit to 1 in EDMDR. If the BEF bit is 1 in EDMDR, transfer can be resumed from midway through a block.

#### (5) Hardware Standby Mode and Reset Input

The EXDMAC is initialized in hardware standby mode and by a reset. EXDMA transfer is not guaranteed in these cases.

### 8.4.13 Relationship between EXDMAC and Other Bus Masters

The read and write operations in an EXDMA transfer cycle are indivisible, and a refresh cycle\*, external bus release cycle, or internal bus master (CPU, DTC, or DMAC) external space access cycle never occurs between the two.

When read and write cycles occur consecutively, as in burst transfer or block transfer, a refresh\* or external bus release state may be inserted after the write cycle. As the internal bus masters are of lower priority than the EXDMAC, external space accesses by internal bus masters are not executed until the EXDMAC releases the bus.

The EXDMAC releases the bus in the following cases:

1. When EXDMA transfer is performed in cycle steal mode
2. When switching to a different channel
3. When transfer ends in burst transfer mode
4. When transfer of one block ends in block transfer mode
5. When burst transfer or block transfer is performed with the BGUP bit in EDMDR set to 1 (however, the bus is not released between read and write cycles)

Note: \* Not supported in the 5-V version.

## 8.5 Interrupt Sources

EXDMAC interrupt sources are a transfer end indicated by the transfer counter, and repeat area overflow interrupts. Table 8.4 shows the interrupt sources and their priority order.

**Table 8.4 Interrupt Sources and Priority Order**

| Interrupt | Interrupt source                                     | Interrupt Priority |
|-----------|--|--------------------|
| EXDMTEND2 | Transfer end indicated by channel 2 transfer counter | High<br>↑          |
|           | Channel 2 source address repeat area overflow        |                    |
|           | Channel 2 destination address repeat area overflow   |                    |
| EXDMTEND3 | Transfer end indicated by channel 3 transfer counter | Low<br>↓           |
|           | Channel 3 source address repeat area overflow        |                    |
|           | Channel 3 destination address repeat area overflow   |                    |

Interrupt sources can be enabled or disabled by means of the EDIE bit in EDMDR for the relevant channel, and can be sent to the interrupt controller independently. The relative priority order of the channels is determined by the interrupt controller (see table 8.4).

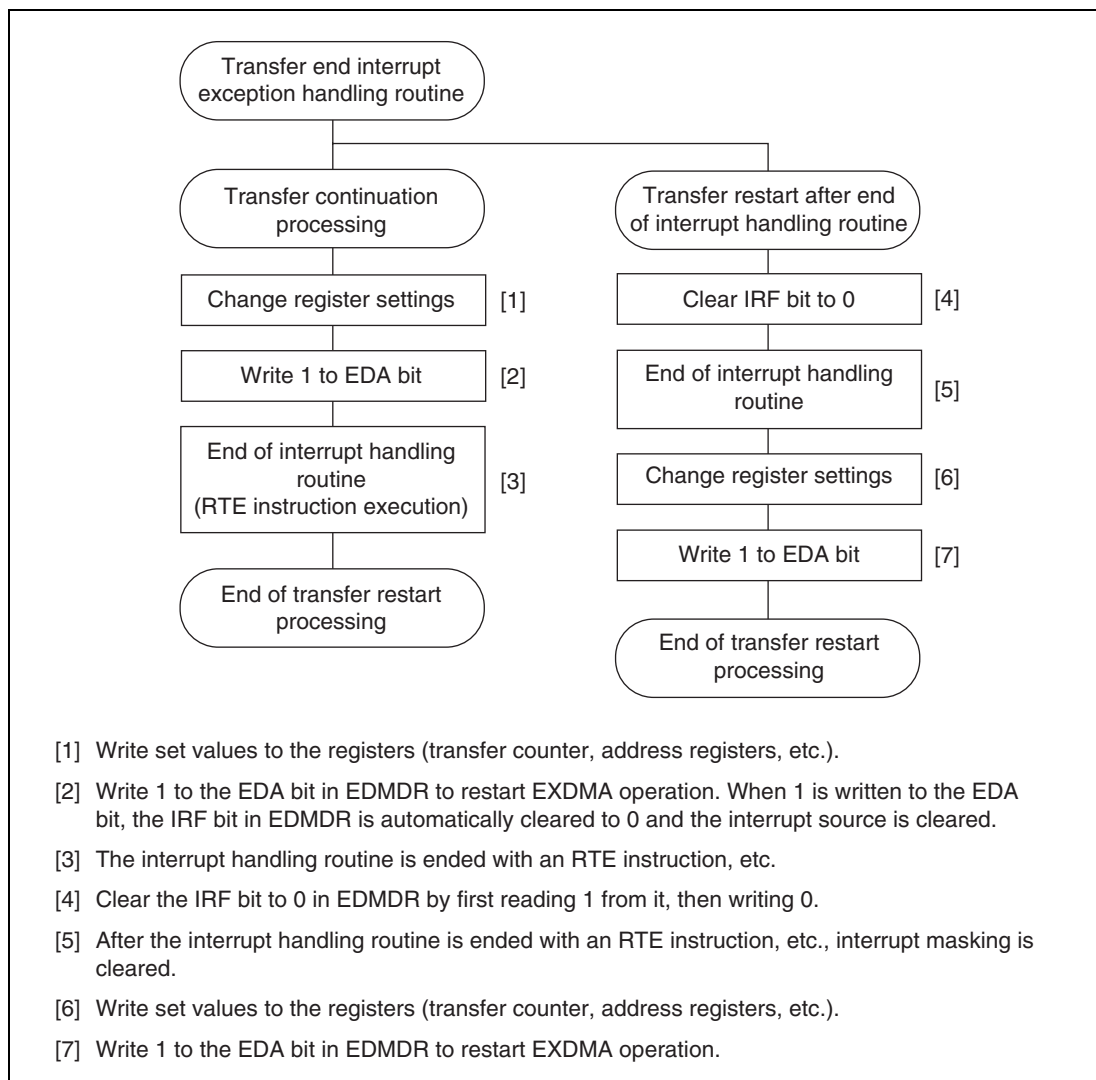

Figure 8.45 shows the transfer end interrupt logic. A transfer end interrupt is generated whenever the EDIE bit is set to 1 while the IRF bit is set to 1 in EDMDR.

**Figure 8.45 Transfer End Interrupt Logic**

Interrupt source settings are made individually with the interrupt enable bits in the registers for the relevant channels. The transfer counter's transfer end interrupt is enabled or disabled by means of the TCEIE bit in EDMDR, the source address register repeat area overflow interrupt by means of the SARIE bit in EDACR, and the destination address register repeat area overflow interrupt by means of the DARIE bit in EDACR. When an interrupt source occurs while the corresponding interrupt enable bit is set to 1, the IRF bit in EDMDR is set to 1. The IRF bit is set by all interrupt sources indiscriminately.

The transfer end interrupt can be cleared either by clearing the IRF bit to 0 in EDMDR within the interrupt handling routine, or by re-setting the transfer counter and address registers and then setting the EDA bit to 1 in EDMDR to perform transfer continuation processing. An example of the procedure for clearing the transfer end interrupt and restarting transfer is shown in figure 8.46.

**Figure 8.46 Example of Procedure for Restarting Transfer on Channel in which Transfer End Interrupt Occurred**

## 8.6 Usage Notes

### (1) EXDMAC Register Access during Operation

Except for clearing the EDA bit to 0 in EDMDR, settings should not be changed for a channel in operation (including the transfer standby state). Transfer must be disabled before changing a setting for an operational channel.

### (2) Module Stop State

When the MSTP14 bit is set to 1 in MSTPCRH, the EXDMAC clock stops and the EXDMAC enters the module stop state. However, 1 cannot be written to the MSTP14 bit when any of the EXDMAC's channels is enabled for transfer, or when an interrupt is being requested. Before setting the MSTP14 bit, first clear the EDA bit in EDMDR to 0, then clear the IRF or EDIE bit in EDMDR to 0.

When the EXDMAC clock stops, EXDMAC registers can no longer be accessed. The following EXDMAC register settings remain valid in the module stop state, and so should be changed, if necessary, before making the module stop transition.

- ETENDE = 1 in EDMDR ( $\overline{\text{ETEND}}$  pin enable)
- EDRAKE = 1 in EDMDR ( $\overline{\text{EDRAK}}$  pin enable)
- AMS = 1 in EDMDR ( $\overline{\text{EDACK}}$  pin enable)

### (3) $\overline{\text{EDREQ}}$ Pin Falling Edge Activation

Falling edge sensing on the  $\overline{\text{EDREQ}}$  pin is performed in synchronization with EXDMAC internal operations, as indicated below.

- [1] Activation request standby state: Waits for low level sensing on  $\overline{\text{EDREQ}}$  pin, then goes to [2].
- [2] Transfer standby state: Waits for EXDMAC data transfer to become possible, then goes to [3].
- [3] Activation request disabled state: Waits for high level sensing on  $\overline{\text{EDREQ}}$  pin, then goes to [1].

After EXDMAC transfer is enabled, the EXDMAC goes to state [1], so low level sensing is used for the initial activation after transfer is enabled.

#### (4) Activation Source Acceptance

At the start of activation source acceptance, low level sensing is used for both falling edge sensing and low level sensing on the  $\overline{\text{EDREQ}}$  pin. Therefore, a request is accepted in the case of a low level at the  $\overline{\text{EDREQ}}$  pin that occurs before execution of the EDMDR write for setting the transfer-enabled state.

When the EXDMAC is activated, make sure, if necessary, that a low level does not remain at the  $\overline{\text{EDREQ}}$  pin from the previous end of transfer, etc.

#### (5) Enabling Interrupt Requests when $\text{IRF} = 1$ in EDMDR

When transfer is started while the IRF bit is set to 1 in EDMDR, if the EDIE bit is set to 1 in EDMDR together with the EDA bit in EDMDR, enabling interrupt requests, an interrupt will be requested since  $\text{EDIE} = 1$  and  $\text{IRF} = 1$ . To prevent the occurrence of an erroneous interrupt request when transfer starts, ensure that the IRF bit is cleared to 0 before the EDIE bit is set to 1.

#### (6) $\overline{\text{ETEND}}$ Pin and CBR Refresh Cycle\*

If the last EXDMAC transfer cycle and a CBR refresh cycle\* occur simultaneously, note that although the CBR refresh\* and the last transfer cycle may be executed consecutively,  $\overline{\text{ETEND}}$  may also go low in this case for the refresh cycle\*.

Note: \* Not supported in the 5-V version.

## Section 9 Data Transfer Controller (DTC)

This LSI includes a data transfer controller (DTC). The DTC can be activated by an interrupt or software, to transfer data.

Figure 9.1 shows a block diagram of the DTC.

### 9.1 Features

- Transfer possible over any number of channels
- Three transfer modes
  1. Normal mode
    - One operation transfers one byte or one word of data.
    - Memory address is incremented or decremented by 1 or 2.
    - From 1 to 65,536 transfers can be specified.
  2. Repeat mode
    - One operation transfers one byte or one word of data.
    - Memory address is incremented or decremented by 1 or 2.
    - Once the specified number of transfers (1 to 256) has ended, the initial state is restored, and transfer is repeated.
  3. Block transfer mode
    - One operation transfers one block of data.
    - The block size is 1 to 256 bytes or words.
    - From 1 to 65,536 transfers can be specified.
    - Either the transfer source or the transfer destination is designated as a block area.
- One activation source can trigger a number of data transfers (chain transfer).
- Direct specification of 16-Mbyte address space possible
- Activation by software is possible.
- Transfer can be set in byte or word units.
- A CPU interrupt can be requested for the interrupt that activated the DTC.
- Module stop state can be set.

The DTC's register information is stored in the on-chip RAM. When the DTC is used, the RAME bit in SYSCR and MSTP32 bit in RMMSTPCR must be set to 1 and 0, respectively. A 32-bit bus connects the DTC to the on-chip RAM (1 Kbyte), enabling 32-bit/1-state reading and writing of the DTC register information.

**Figure 9.1 Block Diagram of DTC**

## 9.2 Register Descriptions

DTC has the following registers.

- DTC mode register A (MRA)
- DTC mode register B (MRB)
- DTC source address register (SAR)
- DTC destination address register (DAR)
- DTC transfer count register A (CRA)
- DTC transfer count register B (CRB)

These six registers cannot be directly accessed from the CPU. When activated, the DTC reads a set of register information that is stored in an on-chip RAM to the corresponding DTC registers and transfers data. After the data transfer, it writes a set of updated register information back to the RAM.

- DTC enable registers A to I (DTCERA to DTCERI)
- DTC vector register (DTVECR)
- DTC control register (DTCCR)

### 9.2.1 DTC Mode Register A (MRA)

MRA selects the DTC operating mode.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | SM1      | Undefined     | —   | Source Address Mode 1 and 0  |
| 6   | SM0      | Undefined     | —   | These bits specify an SAR operation after a data transfer.<br>0x: SAR is fixed<br>10: SAR is incremented after a transfer<br>(by +1 when Sz = 0; by +2 when Sz = 1)<br>11: SAR is decremented after a transfer<br>(by -1 when Sz = 0; by -2 when Sz = 1) |

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 5   | DM1      | Undefined     | —   | Destination Address Mode 1 and 0  |
| 4   | DM0      | Undefined     | —   | These bits specify a DAR operation after a data transfer.<br>0x: DAR is fixed<br>10: DAR is incremented after a transfer<br>(by +1 when Sz = 0; by +2 when Sz = 1)<br>11: DAR is decremented after a transfer<br>(by -1 when Sz = 0; by -2 when Sz = 1)                   |
| 3   | MD1      | Undefined     | —   | DTC Mode  |
| 2   | MD0      | Undefined     | —   | These bits specify the DTC transfer mode.<br>00: Normal mode<br>01: Repeat mode<br>10: Block transfer mode<br>11: Setting prohibited  |
| 1   | DTS      | Undefined     | —   | DTC Transfer Mode Select<br>Specifies whether the source side or the destination side is set to be a repeat area or block area, in repeat mode or block transfer mode.<br>0: Destination side is repeat area or block area<br>1: Source side is repeat area or block area |
| 0   | Sz       | Undefined     | —   | DTC Data Transfer Size<br>Specifies the size of data to be transferred.<br>0: Byte-size transfer<br>1: Word-size transfer   |

## [Legend]

x: Don't care

## 9.2.2 DTC Mode Register B (MRB)

MRB selects the DTC operating mode.

| Bit    | Bit Name | Initial Value | R/W | Description  |
|--------|----------|---------------|-----|--|
| 7      | CHNE     | Undefined     | —   | <p>DTC Chain Transfer Enable</p> <p>When this bit is set to 1, a chain transfer will be performed. For details, refer to section 9.5.4, Chain Transfer.</p> <p>In data transfer with CHNE set to 1, determination of the end of the specified number of transfers, clearing of the activation source flag, and clearing of DTCER is not performed.</p> |
| 6      | DISEL    | Undefined     | —   | <p>DTC Interrupt Select</p> <p>When this bit is set to 1, a CPU interrupt request is generated every time after a data transfer ends. When this bit is set to 0, a CPU interrupt request is generated at the time when the specified number of data transfer ends.</p>   |
| 5      | CHNS     | Undefined     | —   | <p>DTC Chain Transfer Select</p> <p>Specifies the chain transfer condition.</p> <p>0: Chain transfer every time</p> <p>1: Chain transfer only when transfer counter = 0</p>  |
| 4 to 0 | —        | Undefined     | —   | <p>Reserved</p> <p>These bits have no effect on DTC operation, and should always be written with 0.</p>  |

### 9.2.3 DTC Source Address Register (SAR)

SAR is a 24-bit register that designates the source address of data to be transferred by the DTC. For word-size transfer, specify an even source address.

### 9.2.4 DTC Destination Address Register (DAR)

DAR is a 24-bit register that designates the destination address of data to be transferred by the DTC. For word-size transfer, specify an even destination address.

### 9.2.5 DTC Transfer Count Register A (CRA)

CRA is a 16-bit register that designates the number of times data is to be transferred by the DTC.

In normal mode, the entire CRA functions as a 16-bit transfer counter (1 to 65,536). It is decremented by 1 every time data is transferred, and transfer ends when the count reaches H'0000.

In repeat mode or block transfer mode, the CRA is divided into two parts: the upper 8 bits (CRAH) and the lower 8 bits (CRAL). CRAH holds the number of transfers while CRAL functions as an 8-bit transfer counter (1 to 256). CRAL is decremented by 1 every time data is transferred, and the contents of CRAH are sent when the count reaches H'00.

### 9.2.6 DTC Transfer Count Register B (CRB)

CRB is a 16-bit register that designates the number of times data is to be transferred by the DTC in block transfer mode. It functions as a 16-bit transfer counter (1 to 65,536) that is decremented by 1 every time data is transferred, and transfer ends when the count reaches H'0000. The CRB is not available in normal and repeat modes.

### 9.2.7 DTC Enable Registers A to I (DTCERA to DTCERI)

DTCER which is comprised of registers, DTCERA to DTCERI, is a register that specifies DTC activation interrupt sources. The correspondence between interrupt sources and DTCE bits is shown in table 9.2. For DTCE bit setting, use bit manipulation instructions such as BSET and BCLR for reading and writing. If all interrupts are masked, multiple activation sources can be set at one time (only at the initial setting) by writing data after executing a dummy read on the relevant register.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | DTCE7    | 0             | R/W | DTC Activation Enable   |
| 6   | DTCE6    | 0             | R/W | Setting this bit to 1 specifies a relevant interrupt source to a DTC activation source.   |
| 5   | DTCE5    | 0             | R/W |   |
| 4   | DTCE4    | 0             | R/W | [Clearing conditions]   |
| 3   | DTCE3    | 0             | R/W | <ul style="list-style-type: none"> <li>When the DISEL bit is 1 and the data transfer has ended</li> </ul>   |
| 2   | DTCE2    | 0             | R/W | <ul style="list-style-type: none"> <li>When the specified number of transfers have ended</li> </ul>   |
| 1   | DTCE1    | 0             | R/W |   |
| 0   | DTCE0    | 0             | R/W | <p>These bits are not automatically cleared when the DISEL bit is 0 and the specified number of transfers have not ended</p> <ul style="list-style-type: none"> <li>When 0 is written to DTCE after reading DTCE = 1</li> </ul> |

### 9.2.8 DTC Vector Register (DTVECR)

DTVECR sets a vector number for the software activation interrupt.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | DTVEC7   | 0             | R/W | DTC Software Activation Vectors 7 to 0  |
| 6   | DTVEC6   | 0             | R/W | These bits specify a vector number for DTC software activation.   |
| 5   | DTVEC5   | 0             | R/W |   |
| 4   | DTVEC4   | 0             | R/W | The vector address is expressed as H'0400 + (vector number × 2). For example, when DTVEC7 to DTVEC0 = H'10, the vector address is H'0420. |
| 3   | DTVEC3   | 0             | R/W |   |
| 2   | DTVEC2   | 0             | R/W | These bits can be written to only when the SWDTE bit is 0.  |
| 1   | DTVEC1   | 0             | R/W |   |
| 0   | DTVEC0   | 0             | R/W |   |

### 9.2.9 DTC Control Register (DTCCR)

DTCCR enables or disables DTC activation by software.

| Bit    | Bit Name | Initial Value | R/W | Description  |
|--------|----------|---------------|-----|--|
| 7      | SWDTE    | 0             | R/W | <p>DTC Software Activation Enable</p> <p>Setting this bit to 1 activates the DTC. Only 1 can be written to this bit.</p> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> <li>• When the DISEL bit is 0 and the specified number of transfers have not ended</li> <li>• When 0 is written to the DISEL bit after a software-activated data transfer end interrupt (SWDTEND) request has been sent to the CPU.</li> </ul> <p>When the DISEL bit is 1 and data transfer has ended or when the specified number of transfers have ended, this bit will not be cleared.</p> |
| 6 to 0 | —        | All 0         | R   | <p>Reserved</p> <p>These bits are always read as 0 and cannot be modified.</p>   |

### 9.3 Activation Sources

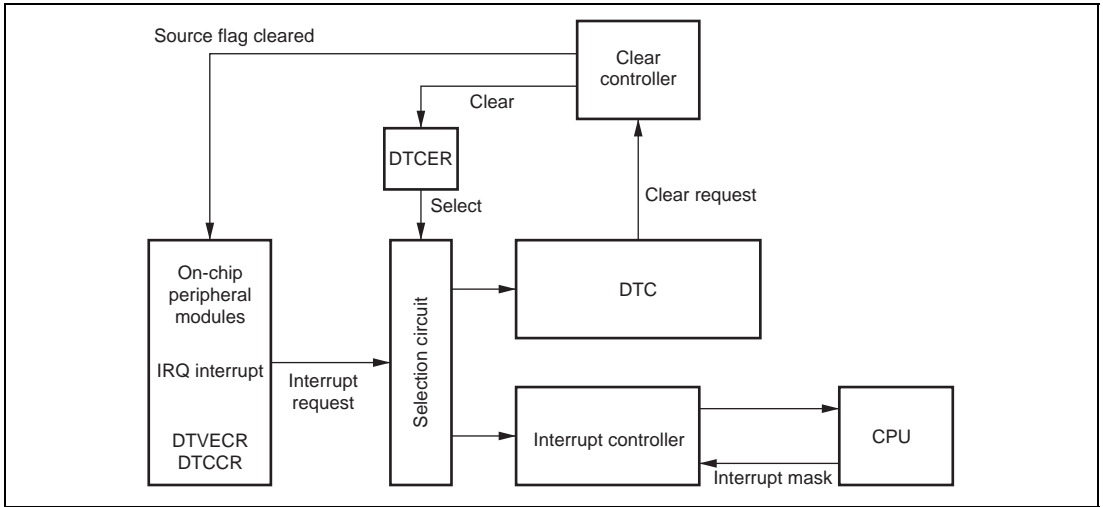

The DTC operates when activated by an interrupt or by a write to DTVECR or DTCCR by software. An interrupt request can be directed to the CPU or DTC, as designated by the corresponding DTCER bit. At the end of a data transfer (or the last consecutive transfer in the case of chain transfer), the activation source or corresponding DTCER bit is cleared. The activation source flag, in the case of RXI0, for example, is the RDRF flag of SCI\_0.

When an interrupt has been designated a DTC activation source, existing CPU mask level and interrupt controller priorities have no effect. If there is more than one activation source at the same time, the DTC operates in accordance with the default priorities.

Table 9.1 shows a relationship between activation sources and DTCER clear conditions. Figure 9.2 shows a block diagram of activation source control. For details see section 5, Interrupt Controller.

**Table 9.1 Relationship between Activation Sources and DTCER Clearing**

| Activation Source          | DISEL = 0 and Specified Number of Transfers Has Not Ended  | DISEL = 1 or Specified Number of Transfers Has Ended   |
|----------------------------|--|--|
| Activation by software     | SWDTE bit is cleared to 0  | <ul style="list-style-type: none"> <li>• SWDTE bit remains set to 1</li> <li>• Interrupt request to CPU</li> </ul>   |
| Activation by an interrupt | <ul style="list-style-type: none"> <li>• Corresponding DTCER bit remains set to 1.</li> <li>• Activation source flag is cleared to 0.</li> </ul> | <ul style="list-style-type: none"> <li>• Corresponding DTCER bit is cleared to 0.</li> <li>• Activation source flag remains set to 1.</li> <li>• Interrupt that became the activation source is requested to the CPU.</li> </ul> |

**Figure 9.2 Block Diagram of DTC Activation Source Control**

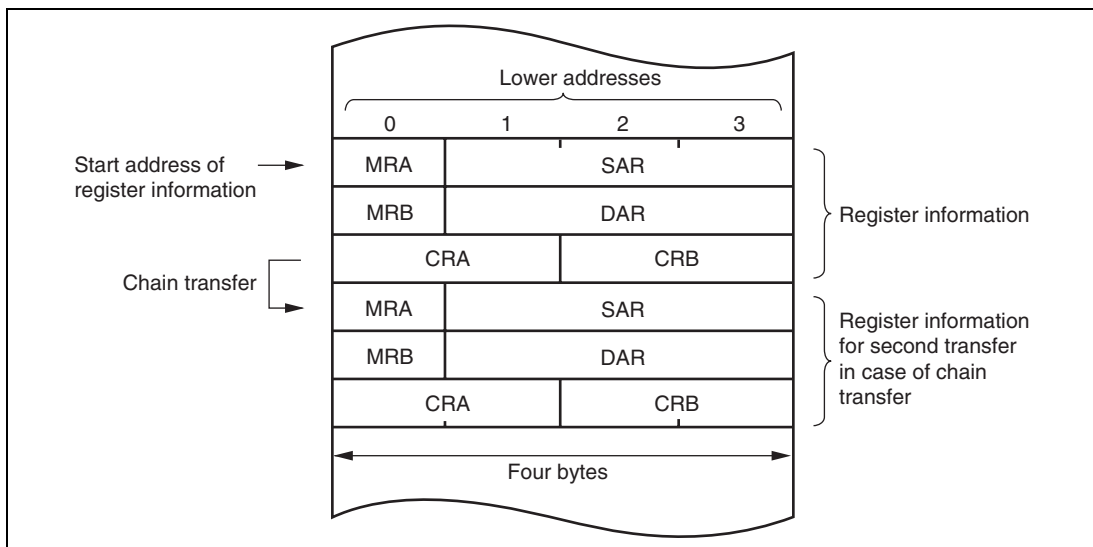

## 9.4 Location of Register Information and DTC Vector Table

Locate the register information in the on-chip RAM (addresses: H'FFBC00 to H'FFBFFF). Register information should be located at the address that is multiple of four within the range. Locating the register information in address space is shown in figure 9.3. Locate the MRA, SAR, MRB, DAR, CRA, and CRB registers, in that order, from the start address of the register information. In the case of chain transfer, register information should be located in consecutive areas as shown in figure 9.3 and the register information start address should be located at the corresponding vector address to the activation source. Figure 9.4 shows correspondences between the DTC vector address and register information. The DTC reads the start address of the register information from the vector address set for each activation source, and then reads the register information from that start address.

When the DTC is activated by software, the vector address is obtained from:  $H'0400 + (DTVECR[7:0] \times 2)$ . For example, if DTVECR is H'10, the vector address is H'0420.

The configuration of the vector address is the same in both normal\* and advanced modes, a 2-byte unit being used in both cases. These two bytes specify the lower bits of the register information start address.

Note: \* Not available in this LSI.

**Figure 9.3 Correspondence between DTC Vector Address and Register Information**

**Figure 9.4 Correspondence between DTC Vector Address and Register Information**

**Table 9.2 Interrupt Sources, DTC Vector Addresses, and Corresponding DTCEs**

| Origin of Activation Source | Activation Source   | Vector Number | DTC Vector Address         | DTCE* <sup>1</sup> | Priority         |
|-----------------------------|---------------------|---------------|----------------------------|--------------------|------------------|
| Software                    | Write to DTVECR     | DTVECR        | H'0400 + (DTVECR[7:0] × 2) | —                  | High<br>↑<br>Low |
| External pin                | IRQ0                | 16            | H'0420                     | DTCEA7             |                  |
|                             | IRQ1                | 17            | H'0422                     | DTCEA6             |                  |
|                             | IRQ2                | 18            | H'0424                     | DTCEA5             |                  |
|                             | IRQ3                | 19            | H'0426                     | DTCEA4             |                  |
|                             | IRQ4                | 20            | H'0428                     | DTCEA3             |                  |
|                             | IRQ5                | 21            | H'042A                     | DTCEA2             |                  |
|                             | IRQ6                | 22            | H'042C                     | DTCEA1             |                  |
|                             | IRQ7                | 23            | H'042E                     | DTCEA0             |                  |
|                             | IRQ8* <sup>2</sup>  | 24            | H'0430                     | DTCEB7             |                  |
|                             | IRQ9* <sup>2</sup>  | 25            | H'0432                     | DTCEB6             |                  |
|                             | IRQ10* <sup>2</sup> | 26            | H'0434                     | DTCEB5             |                  |
|                             | IRQ11* <sup>2</sup> | 17            | H'0436                     | DTCEB4             |                  |
|                             | IRQ12* <sup>2</sup> | 18            | H'0438                     | DTCEB3             |                  |
|                             | IRQ13* <sup>2</sup> | 19            | H'043A                     | DTCEB2             |                  |
|                             | IRQ14* <sup>2</sup> | 30            | H'043C                     | DTCEB1             |                  |
| IRQ15* <sup>2</sup>         | 31                  | H'043E        | DTCEB0                     |                    |                  |
| A/D_0                       | ADI0                | 38            | H'044C                     | DTCEC6             | Low              |

| Origin of Activation Source | Activation Source | Vector Number | DTC Vector Address | DTCE* <sup>1</sup> | Priority  |
|-----------------------------|-------------------|---------------|--------------------|--------------------|-----------|
| TPU_0                       | TGI0A             | 40            | H'0450             | DTCEC5             | High<br>↑ |
|                             | TGI0B             | 41            | H'0452             | DTCEC4             |           |
|                             | TGI0C             | 42            | H'0454             | DTCEC3             |           |
|                             | TGI0D             | 43            | H'0456             | DTCEC2             |           |

- Notes: 1. DTCE bits with no corresponding interrupt are reserved, and 0 should be written to. When clearing the software standby state or all-module-clocks-stop mode with an interrupt, write 0 to the corresponding DTCE bit.
2. Not supported by the H8S/2424 Group.

## 9.5 Operation

The DTC stores register information in the on-chip RAM. When activated, the DTC reads register information that is already stored in the on-chip RAM and transfers data on the basis of that register information. After the data transfer, it writes updated register information back to the on-chip RAM. Pre-storage of register information in the on-chip RAM makes it possible to transfer data over any required number of channels. There are three transfer modes: normal mode, repeat mode, and block transfer mode. Setting the CHNE bit to 1 makes it possible to perform a number of transfers with a single activation (chain transfer). A setting can also be made to have chain transfer performed only when the transfer counter value is 0. This enables DTC re-setting to be performed by the DTC itself.

The 24-bit SAR designates the DTC transfer source address and the 24-bit DAR designates the transfer destination address. After each transfer, SAR and DAR are independently incremented, decremented, or left fixed.

Figure 9.5 shows a flowchart of DTC operation, and table 9.3 summarizes the chain transfer conditions (combinations for performing the second and third transfers are omitted).

**Figure 9.5 Flowchart of DTC Operation**

**Table 9.3 Chain Transfer Conditions**

| 1st Transfer |      |       |       | 2nd Transfer |      |       |       | DTC Transfer             |
|--------------|------|-------|-------|--------------|------|-------|-------|--------------------------|
| CHNE         | CHNS | DISEL | CR    | CHNE         | CHNS | DISEL | CR    |                          |
| 0            | —    | 0     | Not 0 | —            | —    | —     | —     | Ends at 1st transfer     |
| 0            | —    | 0     | 0     | —            | —    | —     | —     | Ends at 1st transfer     |
| 0            | —    | 1     | —     | —            | —    | —     | —     | Interrupt request to CPU |
| 1            | 0    | —     | —     | 0            | —    | 0     | Not 0 | Ends at 2nd transfer     |
|              |      |       |       | 0            | —    | 0     | 0     | Ends at 2nd transfer     |
|              |      |       |       | 0            | —    | 1     | —     | Interrupt request to CPU |
| 1            | 1    | 0     | Not 0 | —            | —    | —     | —     | Ends at 1st transfer     |
| 1            | 1    | —     | 0     | 0            | —    | 0     | Not 0 | Ends at 2nd transfer     |
|              |      |       |       | 0            | —    | 0     | 0     | Ends at 2nd transfer     |
|              |      |       |       | 0            | —    | 1     | —     | Interrupt request to CPU |
| 1            | 1    | 1     | Not 0 | —            | —    | —     | —     | Ends at 1st transfer     |
|              |      |       |       | —            | —    | —     | —     | Interrupt request to CPU |

### 9.5.1 Normal Mode

In normal mode, one operation transfers one byte or one word of data. Table 9.4 lists the register function in normal mode. From 1 to 65,536 transfers can be specified. Once the specified number of transfers has ended, a CPU interrupt can be requested.

**Table 9.4 Register Function in Normal Mode**

| Name                             | Abbreviation | Function                       |
|----------------------------------|--------------|--------------------------------|
| DTC source address register      | SAR          | Designates source address      |
| DTC destination address register | DAR          | Designates destination address |
| DTC transfer count register A    | CRA          | Designates transfer count      |
| DTC transfer count register B    | CRB          | Not used                       |

**Figure 9.6 Memory Mapping in Normal Mode**

## 9.5.2 Repeat Mode

In repeat mode, one operation transfers one byte or one word of data. Table 9.5 lists the register function in repeat mode. From 1 to 256 transfers can be specified. Once the specified number of transfers has ended, the initial state of the transfer counter and the address register specified as the repeat area is restored, and transfer is repeated. In repeat mode the transfer counter value does not reach H'00, and therefore CPU interrupts cannot be requested when DISEL = 0.

**Table 9.5 Register Function in Repeat Mode**

| Name                             | Abbreviation | Function                       |
|----------------------------------|--------------|--------------------------------|
| DTC source address register      | SAR          | Designates source address      |
| DTC destination address register | DAR          | Designates destination address |
| DTC transfer count register AH   | CRAH         | Holds number of transfers      |
| DTC transfer count register AL   | CRAL         | Designates transfer count      |
| DTC transfer count register B    | CRB          | Not used                       |

**Figure 9.7 Memory Mapping in Repeat Mode**

### 9.5.3 Block Transfer Mode

In block transfer mode, one operation transfers one block of data. Either the transfer source or the transfer destination is designated as a block area. Table 9.6 lists the register function in block transfer mode. The block size is 1 to 256. When the transfer of one block ends, the initial state of the block size counter and the address register specified as the block area is restored. The other address register is then incremented, decremented, or left fixed. From 1 to 65,536 transfers can be specified. Once the specified number of transfers has ended, a CPU interrupt is requested.

**Table 9.6 Register Function in Block Transfer Mode**

| Name                             | Abbreviation | Function                       |
|----------------------------------|--------------|--------------------------------|
| DTC source address register      | SAR          | Designates source address      |
| DTC destination address register | DAR          | Designates destination address |
| DTC transfer count register AH   | CRAH         | Holds block size               |
| DTC transfer count register AL   | CRAL         | Designates block size count    |
| DTC transfer count register B    | CRB          | Designates transfer count      |

**Figure 9.8 Memory Mapping in Block Transfer Mode**

## 9.5.4 Chain Transfer

Setting the CHNE bit to 1 enables a number of data transfers to be performed consecutively in response to a single transfer request. SAR, DAR, CRA, CRB, MRA, and MRB, which define data transfers, can be set independently.

Figure 9.9 shows the operation of chain transfer. When activated, the DTC reads the register information start address stored at the vector address, and then reads the first register information at that start address. The CHNE bit in MRB is checked after the end of data transfer, if the value is 1, the next register information, which is located consecutively, is read and transfer is performed. This operation is repeated until the end of data transfer of register information with CHNE = 0. It is also possible, by setting both the CHNE bit and CHNS bit to 1, to specify execution of chain transfer only when the transfer counter value is 0.

In the case of transfer with CHNE set to 1, an interrupt request to the CPU is not generated at the end of the specified number of transfers or by setting of the DISEL bit to 1, and the interrupt source flag for the activation source is not affected.

**Figure 9.9 Operation of Chain Transfer**

### 9.5.5 Interrupt Sources

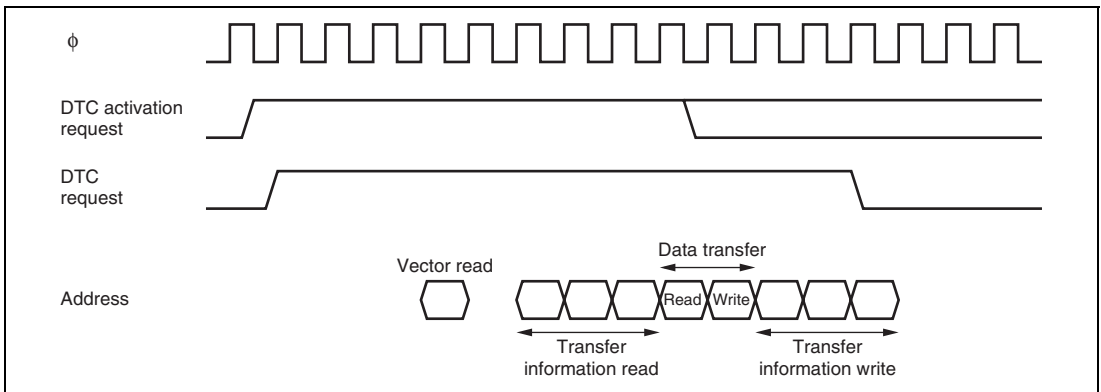

An interrupt request is issued to the CPU when the DTC finishes the specified number of data transfers, or a data transfer for which the DISEL bit was set to 1. In the case of interrupt activation, the interrupt set as the activation source is generated. These interrupts to the CPU are subject to CPU mask level and interrupt controller priority level control.

In the case of activation by software, a software activated data transfer end interrupt (SWDTEND) is generated.

When the DISEL bit is 1 and one data transfer has ended, or the specified number of transfers has ended, after data transfer ends, the SWDTE bit is held at 1 and an SWDTEND interrupt is generated. The interrupt handling routine should clear the SWDTE bit to 0.

When the DTC is activated by software, an SWDTEND interrupt is not generated during a data transfer wait or during data transfer even if the SWDTE bit is set to 1.

### 9.5.6 Operation Timing

**Figure 9.10 DTC Operation Timing (Example in Normal Mode or Repeat Mode)**

**Figure 9.11 DTC Operation Timing (Example of Block Transfer Mode, with Block Size of 2)**

**Figure 9.12 DTC Operation Timing (Example of Chain Transfer)**

### 9.5.7 Number of DTC Execution States

Table 9.7 lists execution status for a single DTC data transfer, and table 9.8 shows the number of states required for each execution status.

**Table 9.7 DTC Execution Status**

| Mode           | Register Information |                 |                |                 |                             |
|----------------|----------------------|-----------------|----------------|-----------------|-----------------------------|
|                | Vector Read<br>I     | Read/Write<br>J | Data Read<br>K | Data Write<br>L | Internal<br>Operations<br>M |
| Normal         | 1                    | 6               | 1              | 1               | 3                           |
| Repeat         | 1                    | 6               | 1              | 1               | 3                           |
| Block transfer | 1                    | 6               | N              | N               | 3                           |

[Legend]

N: Block size (initial setting of CRAH and CRAL)

| Execution<br>status   | Vector read                        | $S_I$ | —              | 1              | —                        | —  | 4                | 6+2m | 2  | 3+m |
|                       | Register information<br>read/write | $S_J$ | 1              | —              | —                        | —  | —                | —    | —  | —   |
|                       | Byte data read                     | $S_K$ | 1              | 1              | 2                        | 2  | 2                | 3+m  | 2  | 3+m |
|                       | Word data read                     | $S_K$ | 1              | 1              | 4                        | 2  | 4                | 6+2m | 2  | 3+m |
|                       | Byte data write                    | $S_L$ | 1              | 1              | 2                        | 2  | 2                | 3+m  | 2  | 3+m |
|                       | Word data write                    | $S_L$ | 1              | 1              | 4                        | 2  | 4                | 6+2m | 2  | 3+m |
|                       | Internal operation                 | $S_M$ | 1              |                |                          |    |                  |      |    |     |

The number of execution states is calculated from the formula below. Note that  $\Sigma$  means the sum of all transfers activated by one activation event (the number in which the CHNE bit is set to 1, plus 1).

$$\text{Number of execution states} = I \cdot S_I + \Sigma (J \cdot S_J + K \cdot S_K + L \cdot S_L) + M \cdot S_M$$

For example, when the DTC vector address table is located in on-chip ROM, normal mode is set, and data is transferred from the on-chip ROM to an internal I/O register, the time required for the DTC operation is 13 states. The time from activation to the end of the data write is 10 states.

## 9.6 Procedures for Using DTC

### 9.6.1 Activation by Interrupt

The procedure for using the DTC with interrupt activation is as follows:

1. Set the MRA, MRB, SAR, DAR, CRA, and CRB register information in the on-chip RAM.
2. Set the start address of the register information in the DTC vector address.
3. Set the corresponding bit in DTCE to 1.
4. Set the enable bits for the interrupt sources to be used as the activation sources to 1. The DTC is activated when an interrupt used as an activation source is generated.
5. After the end of one data transfer, or after the specified number of data transfers have ended, the DTCE bit is cleared to 0 and a CPU interrupt is requested. If the DTC is to continue transferring data, set the DTCE bit to 1.

### 9.6.2 Activation by Software

The procedure for using the DTC with software activation is as follows:

1. Set the MRA, MRB, SAR, DAR, CRA, and CRB register information in the on-chip RAM.
2. Set the start address of the register information in the DTC vector address.
3. Check that the SWDTE bit is 0.
4. Write 1 to SWDTE bit and the vector number to DTVECR.
5. Check the vector number written to DTVECR.
6. After the end of one data transfer, if the DISEL bit is 0 and a CPU interrupt is not requested, the SWDTE bit is cleared to 0. If the DTC is to continue transferring data, set the SWDTE bit to 1. When the DISEL bit is 1, or after the specified number of data transfers have ended, the SWDTE bit is held at 1 and a CPU interrupt is requested.

## 9.7 Examples of Use of the DTC

### 9.7.1 Normal Mode

An example is shown in which the DTC is used to receive 128 bytes of data via the SCI.

1. Set MRA to fixed source address ( $SM1 = SM0 = 0$ ), incrementing destination address ( $DM1 = 1, DM0 = 0$ ), normal mode ( $MD1 = MD0 = 0$ ), and byte size ( $Sz = 0$ ). The DTS bit can have any value. Set MRB for one data transfer by one interrupt ( $CHNE = 0, DISEL = 0$ ). Set the SCI RDR address in SAR, the start address of the RAM area where the data will be received in DAR, and 128 (H'0080) in CRA. CRB can be set to any value.
2. Set the start address of the register information at the DTC vector address.
3. Set the corresponding bit in DTCER to 1.
4. Set the SCI to the appropriate receive mode. Set the RIE bit in SCR to 1 to enable the reception complete (RXI) interrupt. Since the generation of a receive error during the SCI reception operation will disable subsequent reception, the CPU should be enabled to accept receive error interrupts.
5. Each time reception of one byte of data ends on the SCI, the RDRF flag in SSR is set to 1, an RXI interrupt is generated, and the DTC is activated. The receive data is transferred from RDR to RAM by the DTC. DAR is incremented and CRA is decremented. The RDRF flag is automatically cleared to 0.
6. When CRA becomes 0 after the 128 data transfers have ended, the RDRF flag is held at 1, the DTCE bit is cleared to 0, and an RXI interrupt request is sent to the CPU. The interrupt handling routine should perform wrap-up processing.

### 9.7.2 Chain Transfer

An example of DTC chain transfer is shown in which pulse output is performed using the PPG. Chain transfer can be used to perform pulse output data transfer and PPG output trigger cycle updating. Repeat mode transfer to NDR of the PPG is performed in the first half of the chain transfer, and normal mode transfer to the TPU's TGR in the second half. This is because clearing of the activation source and interrupt generation at the end of the specified number of transfers are restricted to the second half of the chain transfer (transfer when CHNE = 0).

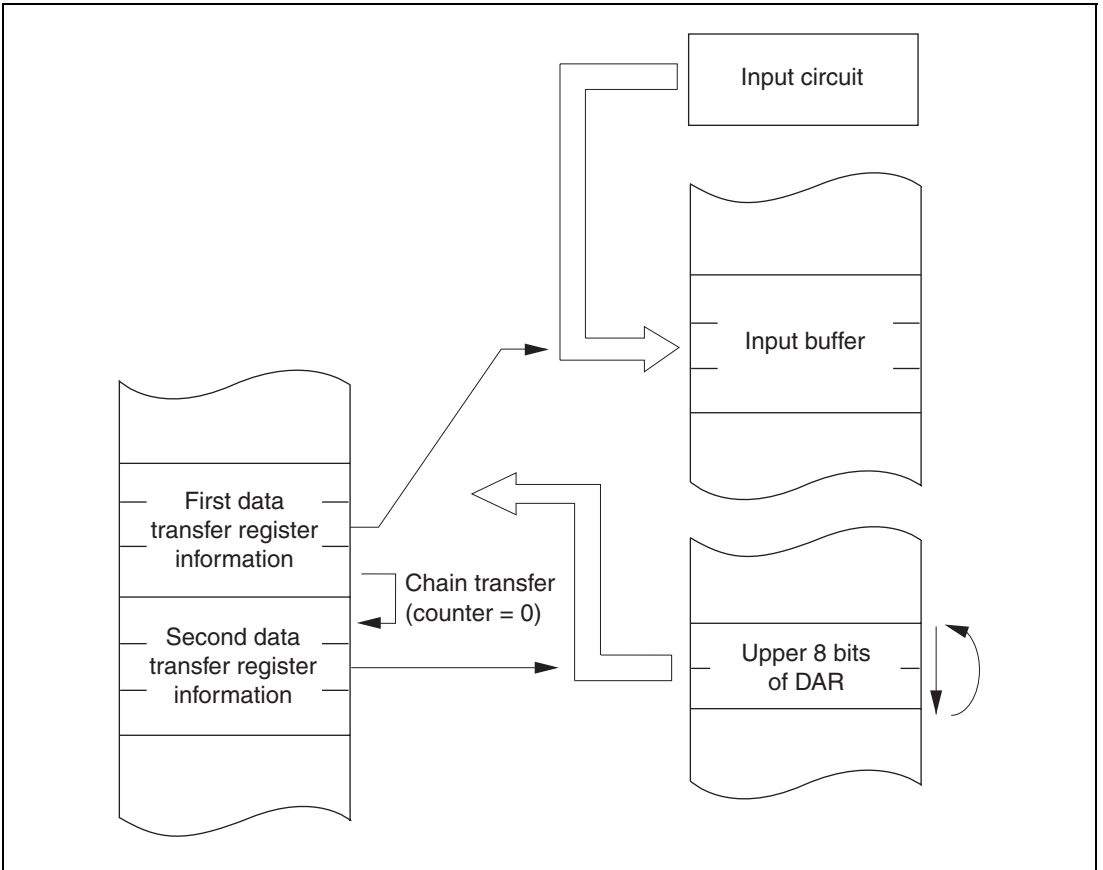

1. Perform settings for transfer to NDR of the PPG. Set MRA to source address incrementing (SM1 = 1, SM0 = 0), fixed destination address (DM1 = DM0 = 0), repeat mode (MD1 = 0, MD0 = 1), and word size (Sz = 1). Set the source side as a repeat area (DTS = 1). Set MRB to chain mode (CHNE = 1, DIESEL = 0). Set the data table start address in SAR, the NDRH address in DAR, and the data table size in CRAH and CRAL. CRB can be set to any value.
2. Perform settings for transfer to the TPU's TGR. Set MRA to source address incrementing (SM1 = 1, SM0 = 0), fixed destination address (DM1 = DM0 = 0), normal mode (MD1 = MD0 = 0), and word size (Sz = 1). Set the data table start address in SAR, the TGRA address in DAR, and the data table size in CRA. CRB can be set to any value.
3. Locate the TPU transfer register information consecutively after the NDR transfer register information.
4. Set the start address of the NDR transfer register information to the DTC vector address.
5. Set the bit corresponding to TGIA in DTCER to 1.
6. Set TGRA as an output compare register (output disabled) with TIOR, and enable the TGIA interrupt with TIER.
7. Set the initial output value in PODR, and the next output value in NDR. Set bits in DDR and NDER for which output is to be performed to 1. Using PCR, select the TPU compare match to be used as the output trigger.
8. Set the CST bit in TSTR to 1, and start the TCNT count operation.
9. Each time a TGRA compare match occurs, the next output value is transferred to NDR and the set value of the next output trigger period is transferred to TGRA. The activation source TGFA flag is cleared.
10. When the specified number of transfers are completed (the TPU transfer CRA value is 0), the TGFA flag is held at 1, the DTCE bit is cleared to 0, and a TGIA interrupt request is sent to the CPU. Termination processing should be performed in the interrupt handling routine.

### 9.7.3 Chain Transfer when Counter = 0

By executing a second data transfer, and performing re-setting of the first data transfer, only when the counter value is 0, it is possible to perform 256 or more repeat transfers.

An example is shown in which a 128-Kbyte input buffer is configured. The input buffer is assumed to have been set to start at lower address H'0000. Figure 9.13 shows the chain transfer when the counter value is 0.

1. For the first transfer, set the normal mode for input data. Set fixed transfer source address (G/A, etc.), CRA = H'0000 (65,536 times), and CHNE = 1, CHNS = 1, and DISEL = 0.
2. Prepare the upper 8-bit addresses of the start addresses for each of the 65,536 transfer start addresses for the first data transfer in a separate area (in ROM, etc.). For example, if the input buffer comprises H'200000 to H'21FFFF, prepare H'21 and H'20.
3. For the second transfer, set repeat mode (with the source side as the repeat area) for re-setting the transfer destination address for the first data transfer. Use the upper 8 bits of DAR in the first register information area as the transfer destination. Set CHNE = DISEL = 0. If the above input buffer is specified as H'200000 to H'21FFFF, set the transfer counter to 2.
4. Execute the first data transfer 65,536 times by means of interrupts. When the transfer counter for the first data transfer reaches 0, the second data transfer is started. Set the upper 8 bits of the transfer source address for the first data transfer to H'21. The lower 16 bits of the transfer destination address of the first data transfer and the transfer counter are H'0000.
5. Next, execute the first data transfer the 65,536 times specified for the first data transfer by means of interrupts. When the transfer counter for the first data transfer reaches 0, the second data transfer is started. Set the upper 8 bits of the transfer source address for the first data transfer to H'20. The lower 16 bits of the transfer destination address of the first data transfer and the transfer counter are H'0000.
6. Steps 4 and 5 are repeated endlessly. As repeat mode is specified for the second data transfer, an interrupt request is not sent to the CPU.

**Figure 9.13 Chain Transfer when Counter = 0**

### 9.7.4 Software Activation

An example is shown in which the DTC is used to transfer a block of 128 bytes of data by means of software activation. The transfer source address is H'1000 and the destination address is H'2000. The vector number is H'60, so the vector address is H'04C0.

1. Set MRA to incrementing source address (SM1 = 1, SM0 = 0), incrementing destination address (DM1 = 1, DM0 = 0), block transfer mode (MD1 = 1, MD0 = 0), and byte size (Sz = 0). The DTS bit can have any value. Set MRB for one block transfer by one interrupt (CHNE = 0). Set the transfer source address (H'1000) in SAR, the destination address (H'2000) in DAR, and 128 (H'8080) in CRA. Set 1 (H'0001) in CRB.
2. Set the start address of the register information at the DTC vector address (H'04C0).
3. Check that the SWDTE bit in DTCCR is 0. Check that there is currently no transfer activated by software.
4. Write 1 to the SWDTE bit and the vector number (H'60) to DTVECR. The write data is H'60.
5. Read DTVECR again and check that it is set to the vector number (H'60). If it is not, this indicates that the write failed. This is presumably because an interrupt occurred between steps 3 and 4 and led to a different software activation. To activate this transfer, go back to step 3.
6. If the write was successful, the DTC is activated and a block of 128 bytes of data is transferred.
7. After the transfer, an SWDTEND interrupt occurs. The interrupt handling routine should clear the SWDTE bit to 0 and perform other wrap-up processing.

## 9.8 Usage Notes

### 9.8.1 Module Stop Function Setting

DTC operation can be disabled or enabled using the module stop control register. The initial setting is for DTC operation to be enabled. Register access is disabled by setting the module stop state. The module stop state cannot be set while the DTC is activated. For details, refer to section 23, Power-Down Modes.

### 9.8.2 On-Chip RAM

The MRA, MRB, SAR, DAR, CRA, and CRB registers are all located in on-chip RAM. When the DTC is used, the RAME bit in SYSCR must not be cleared to 0 and the corresponding MSTP bit in RMMSTPCR must not be set to 1.

### 9.8.3 DTCE Bit Setting

For DTCE bit setting, use bit manipulation instructions such as BSET and BCLR. If all interrupts are disabled, multiple activation sources can be set at one time (only at the initial setting) by writing data after executing a dummy read on the relevant register.

### 9.8.4 DMAC Transfer End Interrupt

When DTC transfer is activated by a DMAC transfer end interrupt, regardless of the transfer counter and DISEL bit, the DMAC's DTE bit is not subject to DTC control, and the write data has priority. Consequently, an interrupt request may not be sent to the CPU when the DTC transfer counter reaches 0.

### 9.8.5 Chain Transfer

When chain transfer is used, clearing of the activation source or DTCER is performed when the last of the chain of data transfers is executed. SCI and high-speed A/D converter interrupt/activation sources, on the other hand, are cleared when the DTC reads or writes to the prescribed register. Therefore, when the DTC is activated by an interrupt or activation source, if a read/write of the relevant register is not included in the last chained data transfer, the interrupt or activation source will be retained.

## Section 10 I/O Ports

Table 10.1 summarizes the port functions of the H8S/2426 Group and H8S/2426R Group. Table 10.2 summarizes the port functions of the H8S/2424 Group. The pins of each port also have other functions such as input/output or external interrupt input pins of on-chip peripheral modules. Each I/O port includes a data direction register (DDR) that controls input/output, a data register (DR) that stores output data, a port register (PORT) used to read the pin states, and a port function control register (PFCR) used to set input/output destination. Before enabling each input/output pins, select the input/output destination by PFCR. The input-only ports do not have a DR or DDR register.

Ports A to E have a built-in pull-up MOS function and a pull-up MOS control register (PCR) to control the on/off state of the input pull-up MOS.

Ports 1 to 3, 5 to 8, and A to J include an open-drain control register (ODR) that controls the on/off state of the output buffer PMOS.

Ports 1 to 3 and 5 to 8 can drive a single TTL load and 30-pF capacitive load. Ports A to J can drive a single TTL load and 50-pF capacitive load.

All of the I/O ports can drive a Darlington transistor when outputting data.

Ports 1 and 2 are Schmitt-triggered inputs. The other ports are Schmitt-triggered inputs when used as  $\overline{\text{IRQ}}$  inputs, 16-bit timer pulse unit (TPU) inputs, 8-bit timer (TMR) inputs, and I<sup>2</sup>C bus interface (IIC) inputs.

**Table 10.1 Port Functions of H8S/2426 Group and H8S/2426R Group**

| Port                      | Description  | Mode 1                              | Mode 2 | Mode 4 | Mode 3, 7                    |                            | Schmitt-triggered input Pin <sup>8,3</sup> | Input Pull-up MOS Capability | Open Drain Output Capability | 5-V Tolerance <sup>8,2</sup> |   |
|---------------------------|--|-------------------------------------|--------|--------|------------------------------|----------------------------|--|------------------------------|------------------------------|------------------------------|---|

- Notes: 1. Not supported in the H8S/2426 Group.  
2. Not supported in the 5-V version.  
3. Pins other than Schmitt triggered input pins are CMOS input pins.

**Table 10.2 Port Functions of H8S/2424 Group**

|        |  | PG0/ $\overline{\text{CS0}}$           |        |        | PG0       |          |   |                              | All output pin functions other than $\overline{\text{CS0}}$                                   |                             |

Notes: 1. Not supported in the 5-V version.

2. Pins other than Schmitt triggered input pins are CMOS input pins.

## 10.1 Port 1

Port 1 is an 8-bit I/O port that also has other functions. Port 1 has the following registers. For the port function control registers, refer to section 10.18, Port Function Control Registers.

- Port 1 data direction register (P1DDR)
- Port 1 data register (P1DR)
- Port 1 register (PORT1)
- Port 1 open drain control register (P1ODR)
- Port function control register 5 (PFCR5)

### 10.1.1 Port 1 Data Direction Register (P1DDR)

The individual bits of P1DDR specify input or output for the pins of port 1. P1DDR cannot be read; if it is, an undefined value will be read.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | P17DDR   | 0             | W   | When a pin function is specified as a general purpose I/O, setting this bit to 1 makes the corresponding pin an output port, while clearing this bit to 0 makes the corresponding pin an input port. |
| 6   | P16DDR   | 0             | W   |  |
| 5   | P15DDR   | 0             | W   |  |
| 4   | P14DDR   | 0             | W   |  |
| 3   | P13DDR   | 0             | W   |  |
| 2   | P12DDR   | 0             | W   |  |
| 1   | P11DDR   | 0             | W   |  |
| 0   | P10DDR   | 0             | W   |  |

### 10.1.2 Port 1 Data Register (P1DR)

P1DR stores output data for the port 1 pins.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | P17DR    | 0             | R/W | Output data for a pin is stored when the pin function is specified as a general purpose I/O. |
| 6   | P16DR    | 0             | R/W |  |
| 5   | P15DR    | 0             | R/W |  |
| 4   | P14DR    | 0             | R/W |  |
| 3   | P13DR    | 0             | R/W |  |
| 2   | P12DR    | 0             | R/W |  |
| 1   | P11DR    | 0             | R/W |  |
| 0   | P10DR    | 0             | R/W |  |

### 10.1.3 Port 1 Register (PORT1)

PORT1 shows the pin states of port 1. PORT1 cannot be modified.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | P17      | —*            | R   | If this register is read while a P1DDR bit is set to 1, the corresponding P1DR value is read. If this register is read while a P1DDR bit is cleared to 0, the corresponding pin state is read. |
| 6   | P16      | —*            | R   |  |
| 5   | P15      | —*            | R   |  |
| 4   | P14      | —*            | R   |  |
| 3   | P13      | —*            | R   |  |
| 2   | P12      | —*            | R   |  |
| 1   | P11      | —*            | R   |  |
| 0   | P10      | —*            | R   |  |

Note: \* Determined by the states of pins P17 to P10.

### 10.1.4 Port 1 Open Drain Control Register (P1ODR)

P1ODR specifies the output type of each port 1 pin.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | P17ODR   | 0             | R/W | Setting a P1ODR bit to 1 makes the corresponding pin an NMOS open-drain output pin, while clearing a P1ODR bit to 0 makes the corresponding pin a CMOS output pin. |
| 6   | P16ODR   | 0             | R/W |  |
| 5   | P15ODR   | 0             | R/W |  |
| 4   | P14ODR   | 0             | R/W |  |
| 3   | P13ODR   | 0             | R/W |  |
| 2   | P12ODR   | 0             | R/W |  |
| 1   | P11ODR   | 0             | R/W |  |
| 0   | P10ODR   | 0             | R/W |  |

### 10.1.5 Pin Functions

Port 1 pins also function as the pins for PPG outputs, TPU I/Os, EXDMAC I/Os (H8S/2426 Group, H8S/2426R Group), SSU I/Os, and DMAC I/Os (H8S/2424 Group). The correspondence between the register specification and the pin functions is shown below.

#### (1) Pin Functions of H8S/2426 Group and H8S/2426R Group

- P17/PO15/TIOCB2/TCLKD/ $\overline{\text{EDRAK3}}$ /SCS0-A

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, TPU channel 2 settings (by bits MD3 to MD0 in TMDR\_2, bits IOB3 to IOB0 in TIOR\_2, and bits CCLR1 and CCLR0 in TCR\_2), bits TPSC2 to TPSC0 in TCR\_0 and TCR\_5, bit NDER15 in NDERH of the PPG, bit EDRAKE in EDMDR\_3 of the EXDMAC, bits MSS, CSS1, and CSS0 in SSCRH and bit SSUMS in SSCRL of the SSU, bits SCS0S1 and SCS0S0 in PFCR5, and bit P17DDR.

- Modes 1, 2, 4, and 7 (EXPE = 1)

|                        |                           |                            |            |             |                                   |                            |                          |                             |

[Legend]

—: Not used as the SSU pin (can be used as an I/O port).

- P14/PO12/TIOCA1/SSO0-A

The pin function is switched as shown below according to the combination of the TPU channel 1 settings (by bits MD3 to MD0 in TMDR\_1, bits IOA3 to IOA0 in TIOR\_1, and bits CCLR1 and CCLR0 in TCR\_1), bit NDER12 in NDERH of the PPG, bits MSS and BIDE in SSCRH, bit SSUMS in SSCRL, and bits TE and RE in SSER of the SSU, bits SSO0S1 and SSO0S0 in PFCR5, and bit P14DDR.

[Legend]

x: Don't care

Notes: 1. TIOCA0 input when MD3 to MD0 = B'0000 and IOA3 to IOA0 = B'10xx.

2. TIOCB0 output disabled.

## 10.2 Port 2

Port 2 is an 8-bit I/O port that also has other functions. Port 2 has the following registers. For the port function control registers, refer to section 10.18, Port Function Control Registers.

- Port 2 data direction register (P2DDR)
- Port 2 data register (P2DR)
- Port 2 register (PORT2)
- Port 2 open drain control register (P2ODR)
- Port function control register 3 (PFCR3)

### 10.2.1 Port 2 Data Direction Register (P2DDR)

The individual bits of P2DDR specify input or output for the pins of port 2. P2DDR cannot be read; if it is, an undefined value will be read.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | P27DDR   | 0             | W   | When a pin function is specified as a general purpose I/O, setting this bit to 1 makes the corresponding pin an output port, while clearing this bit to 0 makes the corresponding pin an input port. |
| 6   | P26DDR   | 0             | W   |  |
| 5   | P25DDR   | 0             | W   |  |
| 4   | P24DDR   | 0             | W   |  |
| 3   | P23DDR   | 0             | W   |  |
| 2   | P22DDR   | 0             | W   |  |
| 1   | P21DDR   | 0             | W   |  |
| 0   | P20DDR   | 0             | W   |  |

### 10.2.2 Port 2 Data Register (P2DR)

P2DR stores output data for the port 2 pins.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | P27DR    | 0             | R/W | Output data for a pin is stored when the pin function is specified as a general purpose I/O. |
| 6   | P26DR    | 0             | R/W |  |
| 5   | P25DR    | 0             | R/W |  |
| 4   | P24DR    | 0             | R/W |  |
| 3   | P23DR    | 0             | R/W |  |
| 2   | P22DR    | 0             | R/W |  |
| 1   | P21DR    | 0             | R/W |  |
| 0   | P20DR    | 0             | R/W |  |

### 10.2.3 Port 2 Register (PORT2)

PORT2 shows the pin states of port 2. PORT2 cannot be modified.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | P27      | —*            | R   | If this register is read while a P2DDR bit is set to 1, the corresponding P2DR value is read. If this register is read while a P2DDR bit is cleared to 0, the corresponding pin state is read. |
| 6   | P26      | —*            | R   |  |
| 5   | P25      | —*            | R   |  |
| 4   | P24      | —*            | R   |  |
| 3   | P23      | —*            | R   |  |
| 2   | P22      | —*            | R   |  |
| 1   | P21      | —*            | R   |  |
| 0   | P20      | —*            | R   |  |

Note: \* Determined by the states of pins P27 to P20.

## 10.2.4 Port 2 Open Drain Control Register (P2ODR)

P2ODR specifies the output type of each port 2 pin.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | P27ODR   | 0             | R/W | Setting a P2ODR bit to 1 makes the corresponding pin an NMOS open-drain output pin, while clearing a P2ODR bit to 0 makes the corresponding pin a CMOS output pin. |
| 6   | P26ODR   | 0             | R/W |  |
| 5   | P25ODR   | 0             | R/W |  |
| 4   | P24ODR   | 0             | R/W |  |
| 3   | P23ODR   | 0             | R/W |  |
| 2   | P22ODR   | 0             | R/W |  |
| 1   | P21ODR   | 0             | R/W |  |
| 0   | P20ODR   | 0             | R/W |  |

## 10.2.5 Pin Functions

Port 2 pins also function as the pins for PPG outputs, TPU I/Os, interrupt inputs (H8S/2426 Group, H8S/2426R Group), 8-bit timer I/Os (H8S/2424 Group), I<sup>2</sup>C I/Os, and bus control signal inputs. The correspondence between the register specification and the pin functions is shown below.

### (1) Pin Functions of H8S/2426 Group and H8S/2426R Group

- P27/PO7/TIOCB5/ $\overline{\text{IRQ15-B}}$ /SCL2

The pin function is switched as shown below according to the combination of the TPU channel 5 settings (by bits MD3 to MD0 in TMDR\_5, bits IOB3 to IOB0 in TIOR\_5, and bits CCLR1 and CCLR0 in TCR\_5), bit NDER7 in NDERL of the PPG, bit ICE in ICCRA\_2 of the I<sup>2</sup>C, bit P27DDR, and bit ITS15 in ITSr of the interrupt controller.

| ICE                    | 0   |                            |            |            | 1                      |
|------------------------|---|----------------------------|------------|------------|------------------------|
| TPU channel 5 settings | (1) in table below  | (2) in table below         |            |            | —                      |
| P27DDR                 | —   | 0                          | 1          | 1          | —                      |
| NDER7                  | —   | —                          | 0          | 1          | —                      |
| Pin function           | TIOCB5 output   | P27 input                  | P27 output | PO7 output | SCL2 I/O* <sup>3</sup> |
|                        |   | TIOCB5 input* <sup>1</sup> |            |            |                        |
|                        | $\overline{\text{IRQ15-B}}$ interrupt input* <sup>2</sup> |                            |            |            |                        |

- Notes: 1. TIOCB5 input when MD3 to MD0 = B'0000 or B'01xx and IOB3 = 1.  
 2.  $\overline{\text{IRQ15-B}}$  input when the ITS15 bit in ITSr is 1.  
 3. NMOS open-drain output regardless of P27ODR.

|                        |                        |                                    |        |        |                   |      |
|------------------------|------------------------|------------------------------------|--------|--------|-------------------|------|
| TPU channel 5 settings | (2)                    | (1)                                | (2)    | (2)    | (1)               | (2)  |
| MD3 to MD0             | B'0000, B'01xx         |                                    | B'0010 | B'0011 |                   |      |
| IOB3 to IOB0           | B'0000, B'0100, B'1xxx | B'0001 to B'0011, B'0101 to B'0111 | —      | B'xx00 | Other than B'xx00 |      |
| CCLR1, CCLR0           | —                      | —                                  | —      | —      | Other than B'10   | B'10 |
| Output function        | —                      | Output compare output              | —      | —      | PWM mode 2 output | —    |

## [Legend]

x: Don't care

- Notes:
1. TIOCA5 input when MD3 to MD0 = B'0000 or B'01xx and IOA3 = 1.
  2.  $\overline{\text{IRQ14-B}}$  input when the ITS14 bit in ITSr is 1.
  3. TIOCB5 output disabled.
  4.  $\overline{\text{ADTRG1}}$  input when EXTRGS = 0 and TRGS1 = TRGS0 = 1.
  5. NMOS open-drain output regardless of P26ODR.

- P25/PO5-A/TIOCB4-A/ $\overline{\text{IRQ13-B}}$ / $\overline{\text{WAIT-B}}$

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, bit WAITE in BCR of the bus controller, TPU channel 4 settings (by bits MD3 to MD0 in TMDR\_4, bits IOB3 to IOB0 in TIOR\_4, and bits CCLR1 and CCLR0 in TCR\_4), bit NDER5 in NDERL of the PPG, bits PPGS, TPUS, and TMRS in PFCR3, bit WAITS in PFCR4, bit P25DDR, and bit ITS13 in ITSr of the interrupt controller.

- Modes 1, 2, 4, and 7 (EXPE = 1)

| WAITE                  | 0                                     |                                |            |                            | 1  |

[Legend]

x: Don't care

- Notes:
1. TIOCA4-A input when MD3 to MD0 = B'0000 or B'01xx and IOA3 to IOA0 = B'10xx.
  2. TIOCB4 output disabled.
  3. PO4-A output when the PPGS bit in PFCR3 is 0.
  4. TIOCD4-A input/output when the TPUS bit in PFCR3 is 0.
  5. TMO0-A output when the TMRS bit in PFCR3 is 0.
  6. RxD4-A input when the RxD4S bit in PFCR4 is 0.

- P23/PO3-A/TIOCD3-A/TMCI1-A/TxD4-A

The pin function is switched as shown below according to the combination of the TPU channel 3 settings (by bits MD3 to MD0 in TMDR\_3, bits IOD3 to IOD0 in TIORL\_3, and bits CCLR2 to CCLR0 in TCR\_3), bit NDER3 in NDERL of the PPG, bit TE in SCR\_4 of the SCI, bits PPGS, TPUS, and TMRS in PFCR3, bit TXD4S in PFCR4, and bit P23DDR.

| TPU channel 3 settings | (1) in table below            | (2) in table below             |            |                            |                             |
|------------------------|-------------------------------|--------------------------------|------------|----------------------------|-----------------------------|
| TE                     | —                             | 0                              |            |                            | 1                           |
| P23DDR                 | —                             | 0                              | 1          |                            | —                           |
| NDER3                  | —                             | —                              | 0          | 1                          | —                           |
| Pin function           | TIOCD3-A output* <sup>4</sup> | P23 input                      | P23 output | PO3-A output* <sup>3</sup> | TxD4-A output* <sup>6</sup> |
|                        |                               | TIOCD3-A input* <sup>1*4</sup> |            |                            |                             |
|                        | TMCI1-A input* <sup>2*5</sup> |                                |            |                            |                             |

- Notes: 1. TIOCD3-A input when MD3 to MD0 = B'0000 and IOD3 to IOD0 = B'10xx.  
 2. When used as the external clock input pin for the TMR, its pin function should be specified to the external clock input by the CKS2 to CKS0 bits in TCR\_1.  
 3. PO3-A output when the PPGS bit in PFCR3 is 0.  
 4. TIOCD3-A input/output when the TPUS bit in PFCR3 is 0.  
 5. TMCI1-A input when the TMRS bit in PFCR3 is 0.  
 6. TxD4-A output when the TXD4S bit in PFCR4 is 0.

| TPU channel 3 settings | (2)                    | (1)                                | (2)    | (2)    | (1)               | (2)   |
|------------------------|------------------------|------------------------------------|--------|--------|-------------------|-------|

[Legend]

x: Don't care

- Notes:
1. TIOCC3-A input when MD3 to MD0 = B'0000 and IOC3 to IOC0 = B'10xx.
  2. When used as the external clock input pin for the TMR, its pin function should be specified to the external clock input by the CKS2 to CKS0 bits in TCR\_0.
  3. TIOCD3 output disabled. Output disabled and settings (2) effective when BFA = 1 or BFB = 1 in TMDR\_3.
  4. PO2-A output when the PPGS bit in PFCR3 is 0.
  5. TIOCC3-A input/output when the TPUS bit in PFCR3 is 0.
  6. TMCI0-A input when the TMRS bit in PFCR3 is 0.

- P21/PO1-A/TIOCB3-A/TMRI1-A

The pin function is switched as shown below according to the combination of the TPU channel 3 settings (by bits MD3 to MD0 in TMDR\_3, bits IOB3 to IOB0 in TIORH\_3, and bits CCLR2 to CCLR0 in TCR\_3), bit NDER1 in NDERL of the PPG, bits PPGS, TPUS, and TMRS in PFCR3, and bit P21DDR.

| TPU channel 3 settings | (1) in table below            | (2) in table below             |            |                            |
|------------------------|-------------------------------|--------------------------------|------------|----------------------------|
| P21DDR                 | —                             | 0                              | 1          |                            |
| NDER1                  | —                             | —                              | 0          | 1                          |
| Pin function           | TIOCB3-A output* <sup>4</sup> | P21 input                      | P21 output | PO1-A output* <sup>3</sup> |
|                        |                               | TIOCB3-A input* <sup>1*4</sup> |            |                            |
|                        | TMRI1-A input* <sup>2*5</sup> |                                |            |                            |

- Notes:
1. TIOCB3-A input when MD3 to MD0 = B'0000 and IOB3 to IOB0 = B'10xx.
  2. When used as the counter reset input pin for the TMR, the external reset should be selected using the CCLR1 and CCLR0 bits in TCR\_1 and TMRIS bit in TCCR\_1.
  3. PO1-A output when the PPGS bit in PFCR3 is 0.
  4. TIOCB3-A input/output when the TPUS bit in PFCR3 is 0.
  5. TMRI1-A input when the TMRS bit in PFCR3 is 0.

| Output function        | —                      | Output compare output              | —      | PWM* <sup>3</sup> mode 1 output | PWM mode 2 output | —     |

[Legend]

x: Don't care

- Notes:
1. TIOCA3-A input when MD3 to MD0 = B'0000 and IOA3 to IOA0 = B'10xx.
  2. When used as the counter reset input pin for the TMR, the external reset should be selected using the CCLR1 and CCLR0 bits in TCR\_0 and TMRIS bit in TCCR\_0.
  3. TIOCB3 output disabled.
  4. PO0-A output when the PPGS bit in PFCR3 is 0.
  5. TIOCA3-A input/output when the TPUS bit in PFCR3 is 0.
  6. TMRI0-A input when the TMRS bit in PFCR3 is 0.

## 10.3 Port 3

Port 3 is a 6-bit I/O port that also has other functions. Port 3 has the following registers. For the port function control registers, refer to section 10.18, Port Function Control Registers.

- Port 3 data direction register (P3DDR)
- Port 3 data register (P3DR)
- Port 3 register (PORT3)
- Port 3 open drain control register (P3ODR)
- Port function control register 2 (PFCR2)

### 10.3.1 Port 3 Data Direction Register (P3DDR)

The individual bits of P3DDR specify input or output for the pins of port 3. P3DDR cannot be read; if it is, an undefined value will be read.

| Bit  | Bit Name | Initial Value | R/W | Description  |
|------|----------|---------------|-----|--|
| 7, 6 | —        | All 0         | —   | Reserved   |
| 5    | P35DDR   | 0             | W   | When a pin function is specified as a general purpose I/O, setting this bit to 1 makes the corresponding pin an output port, while clearing this bit to 0 makes the corresponding pin an input port. |
| 4    | P34DDR   | 0             | W   |  |
| 3    | P33DDR   | 0             | W   |  |
| 2    | P32DDR   | 0             | W   |  |
| 1    | P31DDR   | 0             | W   |  |
| 0    | P30DDR   | 0             | W   |  |

### 10.3.2 Port 3 Data Register (P3DR)

P3DR stores output data for the port 3 pins.

| Bit  | Bit Name | Initial Value | R/W | Description  |
|------|----------|---------------|-----|--|
| 7, 6 | —        | All 0         | —   | Reserved<br>These bits are always read as 0 and cannot be modified.                          |
| 5    | P35DR    | 0             | R/W | Output data for a pin is stored when the pin function is specified as a general purpose I/O. |
| 4    | P34DR    | 0             | R/W |  |
| 3    | P33DR    | 0             | R/W |  |
| 2    | P32DR    | 0             | R/W |  |
| 1    | P31DR    | 0             | R/W |  |
| 0    | P30DR    | 0             | R/W |  |

### 10.3.3 Port 3 Register (PORT3)

PORT3 shows the pin states of port 3. PORT3 cannot be modified.

| Bit  | Bit Name | Initial Value | R/W | Description  |
|------|----------|---------------|-----|--|
| 7, 6 | —        | Undefined     | —   | Reserved<br>If these bits are read, they will return an undefined value.   |
| 5    | P35      | —*            | R   | If this register is read while a P3DDR bit is set to 1, the corresponding P3DR value is read. If this register is read while a P3DDR bit is cleared to 0, the corresponding pin state is read. |
| 4    | P34      | —*            | R   |  |
| 3    | P33      | —*            | R   |  |
| 2    | P32      | —*            | R   |  |
| 1    | P31      | —*            | R   |  |
| 0    | P30      | —*            | R   |  |

Note: \* Determined by the states of pins P35 to P30.

### 10.3.4 Port 3 Open Drain Control Register (P3ODR)

P3ODR specifies the output type of each port 3 pin.

| Bit  | Bit Name | Initial Value | R/W | Description  |
|------|----------|---------------|-----|--|
| 7, 6 | —        | All 0         | —   | Reserved<br>These bits are always read as 0. Only the initial values should be written to these bits.  |
| 5    | P35ODR   | 0             | R/W | When $\overline{OE-B}^{*1}/CKE-B^{*2}$ output is not selected, setting this bit to 1 makes the corresponding pin an NMOS open-drain output pin, while clearing the bit to 0 makes the corresponding pin a CMOS output pin. |
| 4    | P34ODR   | 0             | R/W | Setting a bit to 1 makes the corresponding pin an NMOS open-drain output pin, while clearing a bit to 0 makes the corresponding pin a CMOS output pin.   |
| 3    | P33ODR   | 0             | R/W |  |
| 2    | P32ODR   | 0             | R/W |  |
| 1    | P31ODR   | 0             | R/W |  |
| 0    | P30ODR   | 0             | R/W |  |

- Notes:
1. Not supported in the 5-V version.
  2. Not supported in the H8S/2426 Group and H8S/2424 Group.

### 10.3.5 Pin Functions

Port 3 pins also function as the pins for SCI I/Os, I<sup>2</sup>C I/Os, and bus control signal outputs. The correspondence between the register specification and the pin functions is shown below.

- P35/ $\overline{\text{OE-B}}^{*3}$ /CKE-B<sup>\*2</sup>/SCK1/SCL0

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, bit ICE in ICCRA\_0 of the I<sup>2</sup>C, bit C/ $\overline{\text{A}}$  in SMR\_1 and bits CKE0 and CKE1 in SCR\_1 of the SCI, bits OEE and RMTS2 to RMTS0 in DRAMCR<sup>\*3</sup> of the bus controller, bit OES in PFCR2, and bit P35DDR.

- Modes 1, 2, 4, and 7 (EXPE = 1)

|                          |              |               |                |                |               |                           |              |               |                |                |   |  |  |                               |

| OES            | —         |            |             |             |            |                        |
| RMTS2 to RMTS0 | —         |            |             |             |            |                        |
| ICE            | 0         |            |             |             |            | 1                      |
| CKE1           | 0         |            |             |             | 1          | —                      |
| C/ $\bar{A}$   | 0         |            |             | 1           | —          | —                      |
| CKE0           | 0         |            | 1           | —           | —          | —                      |
| P35DDR         | 0         | 1          | —           | —           | —          | —                      |
| Pin function   | P35 input | P35 output | SCK1 output | SCK1 output | SCK1 input | SCL0 I/O <sup>*1</sup> |

- Notes:
1. NMOS open-drain output regardless of P35ODR.
  2. Not supported in the H8S/2426 and H8S/2424 Groups.
  3. Not supported in the 5-V version.

- P34/SCK0/SCK4-A/SDA0

The pin function is switched as shown below according to the combination of bit ICE in ICCRA\_0 of the I<sup>2</sup>C, bit C/ $\bar{A}$  in SMR\_0 and bits CKE0 and CKE1 in SCR\_0 and SCR\_4 of the SCI, and bit P34DDR.

|              |           |            |                                     |                                     |                                 |                        |
|--------------|-----------|------------|-------------------------------------|-------------------------------------|---------------------------------|------------------------|
| ICE          | 0         |            |                                     |                                     |                                 | 1                      |
| CKE1         | 0         |            |                                     |                                     | 1                               | —                      |
| C/ $\bar{A}$ | 0         |            |                                     | 1                                   | —                               | —                      |
| CKE0         | 0         |            | 1                                   | —                                   | —                               | —                      |
| P34DDR       | 0         | 1          | —                                   | —                                   | —                               | —                      |
| Pin function | P34 input | P34 output | SCK0/SCK4-A output <sup>*2,*3</sup> | SCK0/SCK4-A output <sup>*2,*3</sup> | SCK0/SCK4-A input <sup>*3</sup> | SDA0 I/O <sup>*1</sup> |

- Notes:
1. NMOS open-drain output regardless of P34ODR.
  2. Simultaneous output of SCK0 and SCK4 cannot be set.
  3. SCK4-A input/output when the SCK4S bit in PFCR4 is 0.

- P33/RxD1/SCL1

The pin function is switched as shown below according to the combination of bit ICE in ICCRA\_1 of the I<sup>2</sup>C, bit RE in SCR\_1 of the SCI, and bit P33DDR.

|              |           |            |            |           |
|--------------|-----------|------------|------------|-----------|
| ICE          | 0         |            |            | 1         |
| RE           | 0         |            | 1          | —         |
| P33DDR       | 0         | 1          | —          | —         |
| Pin function | P33 input | P33 output | RxD1 input | SCL1 I/O* |

Note: \* NMOS open-drain output regardless of P33ODR.

- P32/RxD0/IrRxD/SDA1

The pin function is switched as shown below according to the combination of bit ICE in ICCRA\_1 of the I<sup>2</sup>C, bit RE in SCR\_0 of the SCI, and bit P32DDR.

|              |           |            |                  |           |
|--------------|-----------|------------|------------------|-----------|
| ICE          | 0         |            |                  | 1         |
| RE           | 0         |            | 1                | —         |
| P32DDR       | 0         | 1          | —                | —         |
| Pin function | P32 input | P32 output | RxD0/IrRxD input | SDA1 I/O* |

Note: \* NMOS open-drain output regardless of P32ODR.

- P31/TxD1

The pin function is switched as shown below according to the combination of bit TE in SCR\_1 of the SCI and bit P31DDR.

|              |           |            |             |
|--------------|-----------|------------|-------------|
| TE           | 0         |            | 1           |
| P31DDR       | 0         | 1          | —           |
| Pin function | P31 input | P31 output | TxD1 output |

- P30/TxD0/IrTxD

The pin function is switched as shown below according to the combination of bit TE in SCR\_0 of the SCI and bit P30DDR.

|              |           |            |                   |
|--------------|-----------|------------|-------------------|
| TE           | 0         |            | 1                 |
| P30DDR       | 0         | 1          | —                 |
| Pin function | P30 input | P30 output | TxD0/IrTxD output |

## 10.4 Port 4

Port 4 is an 8-bit input-only port that also has other functions, such as analog input pins. Port 4 has the following register.

- Port 4 register (PORT4)

### 10.4.1 Port 4 Register (PORT4)

PORT4 is an 8-bit read-only register that shows the pin states of port 4. PORT4 cannot be modified.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | P47      | —*            | R   | The pin states are always read from this register. |
| 6   | P46      | —*            | R   |  |
| 5   | P45      | —*            | R   |  |
| 4   | P44      | —*            | R   |  |
| 3   | P43      | —*            | R   |  |
| 2   | P42      | —*            | R   |  |
| 1   | P41      | —*            | R   |  |
| 0   | P40      | —*            | R   |  |

Note: \* Determined by the states of pins P47 to P40.

### 10.4.2 Pin Functions

Port 4 also functions as the pins for A/D converter analog inputs and interrupt inputs (the H8S/2424 Group). The correspondence between pins is as follows.

#### (1) Pin Functions of H8S/2426 Group and H8S/2426R Group

- P40/AN0\_0, P41/AN1\_0, P42/AN2\_0, P43/AN3\_0, P44/AN4\_0, P45/AN5\_0, P46/AN6\_0, P47/AN7\_0

|              |             |
|--------------|-------------|
| Pin function | ANn_0 input |
|--------------|-------------|

[Legend]

n = 7 to 0

## (2) Pin Functions of H8S/2424 Group

- P47/ $\overline{\text{IRQ7-B}}$ /AN7\_0

|              |   |
|--------------|---|
| Pin function | AN7_0 input                                 |
|              | $\overline{\text{IRQ7-B}}$ interrupt input* |

- P46/ $\overline{\text{IRQ6-B}}$ /AN6\_0

|              |   |
|--------------|---|
| Pin function | AN6_0 input                                 |
|              | $\overline{\text{IRQ6-B}}$ interrupt input* |

- P45/ $\overline{\text{IRQ5-B}}$ /AN5\_0

|              |   |
|--------------|---|
| Pin function | AN5_0 input                                 |
|              | $\overline{\text{IRQ5-B}}$ interrupt input* |

- P44/ $\overline{\text{IRQ4-B}}$ /AN4\_0

|              |   |
|--------------|---|
| Pin function | AN4_0 input                                 |
|              | $\overline{\text{IRQ4-B}}$ interrupt input* |

- P43/ $\overline{\text{IRQ3-B}}$ /AN3\_0

|              |   |
|--------------|---|
| Pin function | AN3_0 input                                 |
|              | $\overline{\text{IRQ3-B}}$ interrupt input* |

- P42/ $\overline{\text{IRQ2-B}}$ /AN2\_0

|              |   |
|--------------|---|
| Pin function | AN2_0 input                                 |
|              | $\overline{\text{IRQ2-B}}$ interrupt input* |

- P41/ $\overline{\text{IRQ1-B}}$ /AN1\_0

|              |   |
|--------------|---|
| Pin function | AN1_0 input                                 |
|              | $\overline{\text{IRQ1-B}}$ interrupt input* |

- P40/ $\overline{\text{IRQ0-B}}$ /AN0\_0

|              |   |
|--------------|---|
| Pin function | AN0_0 input                                 |
|              | $\overline{\text{IRQ0-B}}$ interrupt input* |

Note: \*  $\overline{\text{IRQn}}$  input when the ITS<sub>n</sub> bit in ITS<sub>R</sub> is 1. (n = 7 to 0)

## 10.5 Port 5

Port 5 is a 4-bit I/O port. Port 5 has the following registers. For the port function control registers, refer to section 10.18, Port Function Control Registers.

- Port 5 data direction register (P5DDR)
- Port 5 data register (P5DR)
- Port 5 register (PORT5)
- Port 5 open drain control register (P5ODR)
- Port function control register 4 (PFCR4)

### 10.5.1 Port 5 Data Direction Register (P5DDR)

The individual bits of P5DDR specify input or output for the pins of port 5. P5DDR cannot be read; if it is, an undefined value will be read.

| Bit    | Bit Name | Initial Value | R/W | Description  |
|--------|----------|---------------|-----|--|
| 7 to 4 | —        | All 0         | —   | Reserved   |
| 3      | P53DDR   | 0             | W   | When a pin function is specified as a general purpose I/O, setting this bit to 1 makes the corresponding pin an output port, while clearing this bit to 0 makes the corresponding pin an input port. |
| 2      | P52DDR   | 0             | W   |  |
| 1      | P51DDR   | 0             | W   |  |
| 0      | P50DDR   | 0             | W   |  |

### 10.5.2 Port 5 Data Register (P5DR)

P5DR stores output data for the port 5 pins.

| Bit    | Bit Name | Initial Value | R/W | Description  |
|--------|----------|---------------|-----|--|
| 7 to 4 | —        | All 0         | —   | Reserved<br>These bits are always read as 0 and cannot be modified.                          |
| 3      | P53DR    | 0             | R/W | Output data for a pin is stored when the pin function is specified as a general purpose I/O. |
| 2      | P52DR    | 0             | R/W |  |
| 1      | P51DR    | 0             | R/W |  |
| 0      | P50DR    | 0             | R/W |  |

### 10.5.3 Port 5 Register (PORT5)

PORT5 shows the pin states of port 5. PORT5 cannot be modified.

| Bit    | Bit Name | Initial Value | R/W | Description   |
|--------|----------|---------------|-----|---|
| 7 to 4 | —        | Undefined     | R   | Reserved<br>If these bits are read, they will return an undefined value.  |
| 3      | P53      | —*            | R   | If the P53 to P50 bits are read while a P5DDR bit is set to 1, the corresponding P5DR value is read. If this register is read while a P5DDR bit is cleared to 0, the corresponding pin state is read. |
| 2      | P52      | —*            | R   |   |
| 1      | P51      | —*            | R   |   |
| 0      | P50      | —*            | R   |   |

Note: \* Determined by the states of pins P53 to P50.

### 10.5.4 Port 5 Open Drain Control Register (P5ODR)

P5ODR specifies the output type of each port 5 pin.

| Bit    | Bit Name | Initial Value | R/W | Description  |
|--------|----------|---------------|-----|--|
| 7 to 4 | —        | All 0         | —   | Reserved<br>These bits are always read as 0. Only the initial values should be written to these bits.  |
| 3      | P53ODR   | 0             | R/W | Setting this bit to 1 makes the corresponding pin an NMOS open-drain output pin, while clearing the bit to 0 makes the corresponding pin a CMOS output pin.  |
| 2      | P52ODR   | 0             | R/W | When $\overline{\text{BACK-B}}$ output is not selected, setting this bit to 1 makes the corresponding pin an NMOS open-drain output pin, while clearing the bit to 0 makes the corresponding pin a CMOS output pin.  |
| 1      | P51ODR   | 0             | R/W | Setting this bit to 1 makes the corresponding pin an NMOS open-drain output pin, while clearing the bit to 0 makes the corresponding pin a CMOS output pin.  |
| 0      | P50ODR   | 0             | R/W | When $\overline{\text{BREQO-B}}$ output is not selected, setting this bit to 1 makes the corresponding pin an NMOS open-drain output pin, while clearing the bit to 0 makes the corresponding pin a CMOS output pin. |

### 10.5.5 Pin Functions

Port 5 pins also function as the pins for SCI I/Os, A/D converter inputs, interrupt inputs, I<sup>2</sup>C I/Os, bus control signal I/Os, PPG outputs, TPU I/Os, and 8-bit timer I/Os. The correspondence between the register specification and the pin functions is shown below.

- $\overline{P53/IRQ3-A/ADTRG0-A}$

The pin function is switched as shown below according to the combination of bits TRGS1, TRGS0, and EXTRGS in ADCR\_0 of the ADC, bit P53DDR, and bit ITS3 in ITSr of the interrupt controller.

| P53DDR       | 0   | 1          |
|--------------|---|------------|
| Pin function | P53 input   | P53 output |
|              | $\overline{ADTRG0-A}$ input* <sup>1</sup>         |            |
|              | $\overline{IRQ3-A}$ interrupt input* <sup>2</sup> |            |

Notes: 1.  $\overline{ADTRG0-A}$  input when the EXTRGS bit in ADCR0 is 0, and TRGS1 = TRGS0 = 1.  
 2.  $\overline{IRQ3-A}$  input when the ITS3 bit in ITSr is 0.

- P52/SCK2/IRQ2-A/BACK-B/PO4-B/TIOCA4-B/TMO0-B

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, bit BRLE in BCR of the bus controller, bits OS3 to OS0 in TCSR0 of 8-bit timer, bits MD3 to MD0 in TMDR\_4 of TPU, bits IOA3 to IOA0 in TIOR\_4, TPU channel 4 settings by bits CCLR1 and CCLR0 in TCR\_4, bit NDER4 in NDERL of PPG, bit C/A in SMR\_2 and bits CKE0 and CKE1 in SCR\_2 of the SCI, bits PPGS, TPUS, and TMRS in PFCR3, bit BACKS in PFCR4, bit P52DDR, bit NDER4 in NDERL of the PPG, and bit ITS2 in ITSr of the interrupt controller.

- Modes 1, 2, 4, and 7 (EXPE = 1)

| BRLE<br>BACKS             | BRLE = 0, or BRLE = 1 and BACKS = 0  |                                |               |                               |                |                |               | BRLE = 1<br>and<br>BACKS = 1   |                  |   |  |

- Notes:
1. TIOCC3-B input when MD3 to MD0 = B'0000 and IOC3 to IOC0 = B'10xx.
  2. IRQ1-A input when the ITS1 bit in ITSr is 0.
  3. When used as the external clock input pin for the TMR, its pin function should be specified to the external clock input by the CKS2 to CKS0 bits in TCR\_0.
  4. TIOCD3-B output disabled. Output disabled and settings (2) effective when BFA = 1 or BFB = 1 in TMDR\_3.
  5. NMOS open-drain output regardless of P51ODR.
  6. PO2-B output when the PPGS bit in PFCR3 is 1.
  7. TIOCC3-B input/output when the TPUS bit in PFCR3 is 1.
  8. TMCIO-B input when the TMRS bit in PFCR3 is 1.

- P50/TxD2/ $\overline{\text{IRQ0-A}}$ /SDA3/BREQO-B/PO0-B/TIOCA3-B/TMRI0-B

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, bit BRLE in BCR of the bus controller, bit ICE in ICCRA\_3 of the I<sup>2</sup>C, bits MD3 to MD0 in TMDR\_3 of TPU, bits IOA3 to IOA0 in TIORH\_3, TPU channel 3 settings by bits CCLR2 to CCLR0 in TCR\_3, bit NDER0 in NDERL of PPG, bit TE in SCR\_2 of the SCI, bits PPGS, TPUS, and TMRS in PFCR3, bit BREQOS in PFCR4, bit P50DDR, and bit ITS0 in ITSr of the interrupt controller.

- Notes: 1. TIOCA3-B input when MD3 to MD0 = B'0000 and IOC3 to IOC0 = B'10xx.  
 2.  $\overline{\text{IRQ0-A}}$  input when the ITS0 bit in ITSr is 0.  
 3. When used as the counter reset input pin for the TMR, the external reset should be selected using the CCLR1 and CCLR0 bits in TCR\_0 and TMRIS bit in TCCR\_0.  
 4. TIOCB3-B output disabled.  
 5. NMOS open-drain output regardless of P50ODR.  
 6. PO0-B output when the PPGS bit in PFCR3 is 1.  
 7. TIOCA3-B input/output when the TPUS bit in PFCR3 is 1.  
 8. TMRI0-B input when the TMRS bit in PFCR3 is 1.

## 10.6 Port 6

Note: Port 6 is not supported in the H8S/2424 Group.

Port 6 is a 6-bit I/O port that also has other functions. Port 6 has the following registers. For the port function control registers, refer to section 10.18, Port Function Control Registers.

- Port 6 data direction register (P6DDR)
- Port 6 data register (P6DR)
- Port 6 register (PORT6)
- Port 6 open drain control register (P6ODR)
- Port function control register 3 (PFCR3)

### 10.6.1 Port 6 Data Direction Register (P6DDR)

The individual bits of P6DDR specify input or output for the pins of port 6. P6DDR cannot be read; if it is, an undefined value will be read.

| Bit  | Bit Name | Initial Value | R/W | Description  |
|------|----------|---------------|-----|--|
| 7, 6 | —        | All 0         | —   | Reserved   |
| 5    | P65DDR   | 0             | W   | When a pin function is specified as a general purpose I/O, setting this bit to 1 makes the corresponding pin an output port, while clearing this bit to 0 makes the corresponding pin an input port. |
| 4    | P64DDR   | 0             | W   |  |
| 3    | P63DDR   | 0             | W   |  |
| 2    | P62DDR   | 0             | W   |  |
| 1    | P61DDR   | 0             | W   |  |
| 0    | P60DDR   | 0             | W   |  |

### 10.6.2 Port 6 Data Register (P6DR)

P6DR stores output data for the port 6 pins.

| Bit  | Bit Name | Initial Value | R/W | Description  |
|------|----------|---------------|-----|--|
| 7, 6 | —        | All 0         | —   | Reserved<br>These bits are always read as 0 and cannot be modified.                          |
| 5    | P65DR    | 0             | R/W | Output data for a pin is stored when the pin function is specified as a general purpose I/O. |
| 4    | P64DR    | 0             | R/W |  |
| 3    | P63DR    | 0             | R/W |  |
| 2    | P62DR    | 0             | R/W |  |
| 1    | P61DR    | 0             | R/W |  |
| 0    | P60DR    | 0             | R/W |  |

### 10.6.3 Port 6 Register (PORT6)

PORT6 shows the pin states of port 6. PORT6 cannot be modified.

| Bit  | Bit Name | Initial Value | R/W | Description  |
|------|----------|---------------|-----|--|
| 7, 6 | —        | Undefined     | —   | Reserved<br>If these bits are read, they will return an undefined value.   |
| 5    | P65      | —*            | R   | If this register is read while a P6DDR bit is set to 1, the corresponding P6DR value is read. If this register is read while a P6DDR bit is cleared to 0, the corresponding pin state is read. |
| 4    | P64      | —*            | R   |  |
| 3    | P63      | —*            | R   |  |
| 2    | P62      | —*            | R   |  |
| 1    | P61      | —*            | R   |  |
| 0    | P60      | —*            | R   |  |

Note: \* Determined by the states of pins P65 to P60.

### 10.6.4 Port 6 Open Drain Control Register (P6ODR)

P6ODR specifies the output type of each port 6 pin.

| Bit  | Bit Name | Initial Value | R/W | Description  |
|------|----------|---------------|-----|--|
| 7, 6 | —        | All 0         | —   | Reserved<br>These bits are always read as 0. Only the initial values should be written to these bits.  |
| 5    | P65ODR   | 0             | R/W | Setting a P6ODR bit to 1 makes the corresponding pin an NMOS open-drain output pin, while clearing a P6ODR bit to 0 makes the corresponding pin a CMOS output pin. |
| 4    | P64ODR   | 0             | R/W |  |
| 3    | P63ODR   | 0             | R/W |  |
| 2    | P62ODR   | 0             | R/W |  |
| 1    | P61ODR   | 0             | R/W |  |
| 0    | P60ODR   | 0             | R/W |  |

### 10.6.5 Pin Functions

Port 6 pins also function as 8-bit timer I/Os, interrupt inputs, and DMAC I/Os. The correspondence between the register specification and the pin functions is shown below.

- P65/ $\overline{\text{IRQ13-A}}$ / $\overline{\text{DACK1}}$ /TMO1-A

The pin function is switched as shown below according to the combination of bit SAE1 in DMABCRH of the DMAC, bits OS3 to OS0 in TCSR\_1 of the 8-bit timer, bit TMRS in PFCR3, bit P65DDR, and bit ITS13 in ITSr of the interrupt controller.

| SAE1         | 0                                     |            |                             | 1                                |
|--------------|---------------------------------------|------------|-----------------------------|----------------------------------|
| OS3 to OS0   | All 0                                 |            | Not all 0                   | —                                |
| P65DDR       | 0                                     | 1          | —                           | —                                |
| Pin function | P65 input                             | P65 output | TMO1-A output* <sup>2</sup> | $\overline{\text{DACK1}}$ output |
|              | IRQ13-A interrupt input* <sup>1</sup> |            |                             |                                  |

- Notes:
1.  $\overline{\text{IRQ13-A}}$  input when the ITS13 bit in ITSr is 0.
  2. TMO1-A output when the TMRS bit in PFCR3 is 0.

- P64/ $\overline{\text{IRQ12-A}}$ / $\overline{\text{DACK0}}$ /TMO0-A

The pin function is switched as shown below according to the combination of bit SAE0 in DMABCRH of the DMAC, bits OS3 to OS0 in TCSR\_0 of the 8-bit timer, bit TMRS in PFCR3, bit P64DDR, and bit ITS12 in ITSR of the interrupt controller.

| SAE0         | 0   |            | 1                           |
|--------------|---|------------|-----------------------------|
| OS3 to OS0   | All 0   |            | Not all 0                   |
| P64DDR       | 0   | 1          | —                           |
| Pin function | P64 input   | P64 output | TMO0-A output* <sup>2</sup> |
|              | $\overline{\text{IRQ12-A}}$ interrupt input* <sup>1</sup> |            |                             |
|              | $\overline{\text{DACK0}}$ output                          |            |                             |

Notes: 1.  $\overline{\text{IRQ12-A}}$  input when the ITS12 bit in ITSR is 0.  
 2. TMO0-A output when the TMRS bit in PFCR3 is 0.

- P63/ $\overline{\text{IRQ11-A}}$ / $\overline{\text{TEND1}}$ /TMCI1-A

The pin function is switched as shown below according to the combination of bit TEE1 in DMATCR of the DMAC, bit TMRS in PFCR3, bit P63DDR, and bit ITS11 in ITSR of the interrupt controller.

| TEE1         | 0   |            | 1                                |
|--------------|---|------------|----------------------------------|
| P63DDR       | 0   | 1          | —                                |
| Pin function | P63 input   | P63 output | $\overline{\text{TEND1}}$ output |
|              | $\overline{\text{IRQ11-A}}$ interrupt input* <sup>1</sup> |            |                                  |
|              | TMCI1-A input* <sup>2,3</sup>                             |            |                                  |

Notes: 1.  $\overline{\text{IRQ11-A}}$  input when the ITS11 bit in ITSR is 0.  
 2. When used as the external clock input pin for the TMR, its pin function should be specified to the external clock input by the CKS2 to CKS0 bits in TCR\_1.  
 3. TMCI1-A input when the TMRS bit in PFCR3 is 0.

- P62/ $\overline{\text{IRQ10-A}}$ / $\overline{\text{TEND0}}$ /TMCIO-A

The pin function is switched as shown below according to the combination of bit TEE0 in DMATCR of the DMAC, bit TMRS in PFCR3, bit P62DDR, and bit ITS10 in ITSr of the interrupt controller.

|              |   |            |                                  |
|--------------|---|------------|----------------------------------|
| TEE0         | 0   |            | 1                                |
| P62DDR       | 0   | 1          | —                                |
| Pin function | P62 input   | P62 output | $\overline{\text{TEND0}}$ output |
|              | $\overline{\text{IRQ10-A}}$ interrupt input* <sup>1</sup> |            |                                  |
|              | TMCIO-A input* <sup>2</sup> * <sup>3</sup>                |            |                                  |

- Notes:
1.  $\overline{\text{IRQ10-A}}$  input when the ITS10 bit in ITSr is 0.
  2. When used as the external clock input pin for the TMR, its pin function should be specified to the external clock input by the CKS2 to CKS0 bits in TCR\_0.
  3. TMCIO-A input when the TMRS bit in PFCR3 is 0.

- P61/ $\overline{\text{IRQ9-A}}$ / $\overline{\text{DREQ1}}$ /TMRI1-A

The pin function is switched as shown below according to the combination of bit TMRS in PFCR3, bit P61DDR, and bit ITS9 in ITSr of the interrupt controller.

|              |  |            |
|--------------|--|------------|
| P61DDR       | 0  | 1          |
| Pin function | P61 input  | P61 output |
|              | TMRI1-A input* <sup>1</sup> * <sup>3</sup>               |            |
|              | $\overline{\text{DREQ1}}$ input                          |            |
|              | $\overline{\text{IRQ9-A}}$ interrupt input* <sup>2</sup> |            |

- Notes:
1. When used as the counter reset input pin for the TMR, both the CCLR1 and CCLR0 bits in TCR\_1 should be set to 1.
  2.  $\overline{\text{IRQ9-A}}$  input when the ITS9 bit in ITSr is 0.
  3. TMRI1-A input when the TMRS bit in PFCR3 is 0.

- P60/ $\overline{\text{IRQ8-A}}$ / $\overline{\text{DREQ0}}$ / $\overline{\text{TMRI0-A}}$

The pin function is switched as shown below according to the combination of bit TMRS in PFCR3, bit P60DDR, and bit ITS8 in ITSr of the interrupt controller.

| P60DDR       | 0  | 1          |
|--------------|--|------------|
| Pin function | P60 input  | P60 output |
|              | $\overline{\text{TMRI0-A}}$ input* <sup>1,3</sup> .      |            |
|              | $\overline{\text{DREQ0}}$ input                          |            |
|              | $\overline{\text{IRQ8-A}}$ interrupt input* <sup>2</sup> |            |

- Notes:
1. When used as the counter reset input pin for the TMR, both the CCLR1 and CCLR0 bits in TCR\_0 should be set to 1.
  2.  $\overline{\text{IRQ8-A}}$  input when the ITS8 bit in ITSr is 0.
  3.  $\overline{\text{TMRI0-A}}$  input when the TMRS bit in PFCR3 is 0.

## 10.7 Port 8

Port 8 is a 6-bit I/O port that also has other functions. Port 8 has the following registers. For the port function control registers, refer to section 10.18, Port Function Control Registers.

- Port 8 data direction register (P8DDR)
- Port 8 data register (P8DR)
- Port 8 register (PORT8)
- Port 8 open drain control register (P8ODR)
- Port function control register 3 (PFCR3)

### 10.7.1 Port 8 Data Direction Register (P8DDR)

The individual bits of P8DDR specify input or output for the pins of port 8. P8DDR cannot be read; if it is, an undefined value will be read.

| Bit  | Bit Name | Initial Value | R/W | Description  |
|------|----------|---------------|-----|--|
| 7, 6 | —        | All 0         | —   | Reserved   |
| 5    | P85DDR   | 0             | W   | When a pin function is specified as a general purpose I/O, setting this bit to 1 makes the corresponding pin an output port, while clearing this bit to 0 makes the corresponding pin an input port.<br>Bits 4, 2, and 0 are reserved in the H8S/2424 Group. |
| 4    | P84DDR   | 0             | W   |  |
| 3    | P83DDR   | 0             | W   |  |
| 2    | P82DDR   | 0             | W   |  |
| 1    | P81DDR   | 0             | W   |  |
| 0    | P80DDR   | 0             | W   |  |

### 10.7.2 Port 8 Data Register (P8DR)

P8DR stores output data for the port 8 pins.

| Bit  | Bit Name | Initial Value | R/W | Description  |
|------|----------|---------------|-----|--|
| 7, 6 | —        | All 0         | —   | Reserved<br>These bits are always read as 0 and cannot be modified.                          |
| 5    | P85DR    | 0             | R/W | Output data for a pin is stored when the pin function is specified as a general purpose I/O. |
| 4    | P84DR    | 0             | R/W |  |
| 3    | P83DR    | 0             | R/W | Bits 4, 2, and 0 are reserved in the H8S/2424 Group.   |
| 2    | P82DR    | 0             | R/W |  |
| 1    | P81DR    | 0             | R/W |  |
| 0    | P80DR    | 0             | R/W |  |

### 10.7.3 Port 8 Register (PORT8)

PORT8 shows the pin states of port 8. PORT8 cannot be modified.

| Bit  | Bit Name | Initial Value | R/W | Description  |
|------|----------|---------------|-----|--|
| 7, 6 | —        | Undefined     | —   | Reserved<br>If these bits are read, they will return an undefined value.   |
| 5    | P85      | —*            | R   | If this register is read while a P8DDR bit is set to 1, the corresponding P8DR value is read. If this register is read while a P8DDR bit is cleared to 0, the corresponding pin state is read. |
| 4    | P84      | —*            | R   |  |
| 3    | P83      | —*            | R   | Bits 4, 2, and 0 are reserved in the H8S/2424 Group.   |
| 2    | P82      | —*            | R   |  |
| 1    | P81      | —*            | R   |  |
| 0    | P80      | —*            | R   |  |

Note: \* Determined by the states of pins P85 to P80.

### 10.7.4 Port 8 Open Drain Control Register (P8ODR)

P8ODR specifies the output type of each port 8 pin.

| Bit  | Bit Name | Initial Value | R/W | Description  |
|------|----------|---------------|-----|--|
| 7, 6 | —        | All 0         | —   | Reserved<br>These bits are always read as 0. Only the initial values should be written to these bits.  |
| 5    | P85ODR   | 0             | R/W | Setting a P8ODR bit to 1 makes the corresponding pin an NMOS open-drain output pin, while clearing a P8ODR bit to 0 makes the corresponding pin a CMOS output pin. |
| 4    | P84ODR   | 0             | R/W |  |
| 3    | P83ODR   | 0             | R/W | Bits 4, 2, and 0 are reserved in the H8S/2424 Group.   |
| 2    | P82ODR   | 0             | R/W |  |
| 1    | P81ODR   | 0             | R/W |  |
| 0    | P80ODR   | 0             | R/W |  |

## 10.7.5 Pin Functions

Port 8 pins also function as SCI I/Os, interrupt inputs, EXDMAC I/Os, PPG outputs, TPU I/Os, and 8-bit timer I/Os. The correspondence between the register specification and the pin functions is shown below.

### (1) Pin Functions of H8S/2426 Group and H8S/2426R Group

- P85/ $\overline{\text{EDACK3}}$ / $\overline{\text{IRQ5-B}}$ /SCK3/PO5-B/TIOCB4-B/TMO1-B

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, TPU channel 4 settings (by bits MD3 to MD0 in TMDR\_4, bits IOB3 to IOB0 in TIOR\_4, and bits CCLR1 and CCLR0 in TCR\_4), bits OS3 to OS0 in TCSR\_1 of the 8-bit timer, bit NDER5 in NDERL of the PPG, bit AMS in EDMDR\_3 of the EXDMAC, bit  $\overline{\text{C/A}}$  in SMR\_3 and bits CKE0 and CKE1 in SCR\_3 of the SCI, bits PPGS, TPUS, and TMRS in PFCR3, bit P85DDR, and bit ITS5 in ITSr of the interrupt controller.

- Modes 1, 2, 4, and 7 (EXPE = 1)

| TPU channel 4 settings  | (1) in table below                                       | (2) in table below             |            |                            |             |             |            |                                   |                             |
|-------------------------|--|--------------------------------|------------|----------------------------|-------------|-------------|------------|-----------------------------------|-----------------------------|
| OS3 to OS0              | —  | All 0                          |            |                            |             |             |            |                                   | Not all 0                   |
| AMS                     | —  | 0                              |            |                            |             |             | 1          | —                                 |                             |
| CKE1                    | —  | 0                              |            |                            |             | 1           | —          | —                                 |                             |
| $\overline{\text{C/A}}$ | —  | 0                              |            |                            | 1           | —           | —          | —                                 |                             |
| CKE0                    | —  | 0                              |            | 1                          | —           | —           | —          | —                                 |                             |
| P85DDR                  | —  | 0                              | 1          | 1                          | —           | —           | —          | —                                 |                             |

## 10.8 Port 9

Port 9 is an 8-bit input-only port that also has other functions. Port 9 has the following register.

- Port 9 register (PORT9)

### 10.8.1 Port 9 Register (PORT9)

PORT9 is an 8-bit read-only register that shows the pin states of port 9. PORT9 cannot be modified.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | P97      | —*            | R   | The pin states are always read from this register. Bits 7, 6, and 3 to0 are reserved in the H8S/2424 Group. |
| 6   | P96      | —*            | R   |   |
| 5   | P95      | —*            | R   |   |
| 4   | P99      | —*            | R   |   |
| 3   | P93      | —*            | R   |   |
| 2   | P92      | —*            | R   |   |
| 1   | P91      | —*            | R   |   |
| 0   | P90      | —*            | R   |   |

Note: \* Determined by the states of pins P97 to P90.

## 10.8.2 Pin Functions

Port 9 also functions as the pins for A/D converter analog inputs and D/A converter analog outputs. The correspondence between pins is as follows.

### (1) Pin Functions of H8S/2426 Group and H8S/2426R Group

- P97/AN15\_1

|              |              |
|--------------|--------------|
| Pin function | AN15_1 input |
|--------------|--------------|

- P96/AN14\_1

|              |              |
|--------------|--------------|
| Pin function | AN14_1 input |
|--------------|--------------|

- P95/AN13\_1/DA3

|              |              |
|--------------|--------------|
| Pin function | AN13_1 input |
|              | DA3 output   |

- P94/AN12\_1/DA2

|              |              |
|--------------|--------------|
| Pin function | AN12_1 input |
|              | DA2 output   |

- P93/AN11\_1

|              |              |
|--------------|--------------|
| Pin function | AN11_1 input |
|--------------|--------------|

- P92/AN10\_1

|              |              |
|--------------|--------------|
| Pin function | AN10_1 input |
|--------------|--------------|

- P91/AN9\_1

|              |             |
|--------------|-------------|
| Pin function | AN9_1 input |
|--------------|-------------|

- P90/AN8\_1

|              |             |
|--------------|-------------|
| Pin function | AN8_1 input |
|--------------|-------------|

**(2) Pin Functions of H8S/2424 Group**

- P95/AN13\_1/DA3

|              |              |
|--------------|--------------|
| Pin function | AN13_1 input |
|              | DA3 output   |

- P94/AN12\_1/DA2

|              |              |
|--------------|--------------|
| Pin function | AN12_1 input |
|              | DA2 output   |

## 10.9 Port A

Port A is an 8-bit I/O port that also has other functions. Port A has the following registers. For the port function control registers, refer to section 10.18, Port Function Control Registers.

- Port A data direction register (PADDR)
- Port A data register (PADR)
- Port A register (PORTA)
- Port A pull-up MOS control register (PAPCR)
- Port A open-drain control register (PAODR)
- Port function control register 0 (PFCR0)(the H8S/2424 Group)
- Port function control register 1 (PFCR1)
- Port function control register 4 (PFCR4)
- Port function control register 5 (PFCR5)

### 10.9.1 Port A Data Direction Register (PADDR)

The individual bits of PADDR specify input or output for the pins of port A. PADDR cannot be read; if it is, an undefined value will be read.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | PA7DDR   | 0             | W   | <ul style="list-style-type: none"> <li>Modes 1 and 2</li> </ul>  |
| 6   | PA6DDR   | 0             | W   | Pins PA4 to PA0 are address outputs.   |
| 5   | PA5DDR   | 0             | W   | For pins PA6 and PA5, when the corresponding bit of A22E and A21E is set to 1, setting a PADDR bit to 1 makes the corresponding pin an address output, while clearing the bit to 0 makes the corresponding pin an input port. Clearing one of bits A22E and A21E to 0 makes the corresponding pin an I/O port, and its function can be switched with PADDR.  |
| 4   | PA4DDR   | 0             | W   |  |
| 3   | PA3DDR   | 0             | W   |  |
| 2   | PA2DDR   | 0             | W   |  |
| 1   | PA1DDR   | 0             | W   |  |
| 0   | PA0DDR   | 0             | W   | <p>When A23E is 1, the PA7 pin functions as an address output pin when the PA7DDR bit is set to 1, and as an input port when the bit is cleared to 0.</p> <p>When A23E is 0, operations differ between the H8S/2426 and H8S/2426R Groups and H8S/2424 Group.</p> <p>[H8S/2426 Group and H8S/2426R Group]</p> <p>When the PA7 pin is a general I/O port, the function can be switched with PA7DDR.</p> <p>[H8S/2424 Group]</p> <p>When the <math>\overline{CS}</math> output enable bit (CS7E) is 1, the PA7 pin functions as a <math>\overline{CS7}</math> output pin when the PA7DDR bit is set to 1, and as an input port when the bit is cleared to 0. When the <math>\overline{CS}</math> output enable bit (CS7E) is 0 and the PA7 pin is a general I/O port, the function can be switched with PA7DDR.</p> |

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
|     |          |               |     | <ul style="list-style-type: none"> <li> <p>Modes 7 (when EXPE = 1) and 4</p> <p>For pins PA6 to PA0, when the corresponding bit of A22E to A16E is set to 1, setting a PADDR bit to 1 makes the corresponding pin an address output, while clearing the bit to 0 makes the corresponding pin an input port. Clearing one of bits A22E to A16E to 0 makes the corresponding pin an I/O port, and its function can be switched with PADDR.</p> <p>When A23E is 1, the PA7 pin functions as an address output pin when the PA7DDR bit is set to 1, and as an input port when the bit is cleared to 0.</p> <p>When A23E is 0, operations differ between the H8S/2426 and H8S/2426R Groups and H8S/2424 Group.</p> <p>[H8S/2426 Group and H8S/2426R Group]</p> <p>When the PA7 pin is a general I/O port, the function can be switched with PA7DDR.</p> <p>[H8S/2424 Group]</p> <p>When the <math>\overline{CS}</math> output enable bit (CS7E) is 1, the PA7 pin functions as a <math>\overline{CS7}</math> output pin when the PA7DDR bit is set to 1, and as an input port when the bit is cleared to 0. When the <math>\overline{CS}</math> output enable bit (CS7E) is 0 and the PA7 pin is a general I/O port, the function can be switched with PA7DDR.</p> </li> <li> <p>Mode 7 (when EXPE = 0)</p> <p>Port A is an I/O port, and its pin functions can be switched with PADDR.</p> </li> </ul> |

### 10.9.2 Port A Data Register (PADR)

PADR stores output data for the port A pins.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | PA7DR    | 0             | R/W | Output data for a pin is stored when the pin function is specified as a general purpose I/O. |
| 6   | PA6DR    | 0             | R/W |  |
| 5   | PA5DR    | 0             | R/W |  |
| 4   | PA4DR    | 0             | R/W |  |
| 3   | PA3DR    | 0             | R/W |  |
| 2   | PA2DR    | 0             | R/W |  |
| 1   | PA1DR    | 0             | R/W |  |
| 0   | PA0DR    | 0             | R/W |  |

### 10.9.3 Port A Register (PORTA)

PORTA shows the pin states of port A. PORTA cannot be modified.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | PA7      | —*            | R   | If this register is read while a PADDR bit is set to 1, the corresponding PADR value is read. If this register is read while a PADDR bit is cleared to 0, the corresponding pin state is read. |
| 6   | PA6      | —*            | R   |  |
| 5   | PA5      | —*            | R   |  |
| 4   | PA4      | —*            | R   |  |
| 3   | PA3      | —*            | R   |  |
| 2   | PA2      | —*            | R   |  |
| 1   | PA1      | —*            | R   |  |
| 0   | PA0      | —*            | R   |  |

Note: \* Determined by the states of pins PA7 to PA0.

### 10.9.4 Port A Pull-Up MOS Control Register (PAPCR)

PAPCR controls on/off of the input pull-up MOS for port A. Bits 7 to 5 are valid in modes 1 and 2 and all the bits are valid in modes 4 and 7.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | PA7PCR   | 0             | R/W | When in an input port state, setting the corresponding bit to 1 turns on the input pull-up MOS for that pin. |
| 6   | PA6PCR   | 0             | R/W |  |
| 5   | PA5PCR   | 0             | R/W | These bits should not be set to 1 when the SCI is used.  |
| 4   | PA4PCR   | 0             | R/W |  |
| 3   | PA3PCR   | 0             | R/W |  |
| 2   | PA2PCR   | 0             | R/W |  |
| 1   | PA1PCR   | 0             | R/W |  |
| 0   | PA0PCR   | 0             | R/W |  |

### 10.9.5 Port A Open Drain Control Register (PAODR)

PAODR specifies the output type of each port A pin.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | PA7ODR   | 0             | R/W | When not specified for address output or $\overline{CS7}$ output*, setting a PAODR bit to 1 makes the corresponding pin an NMOS open-drain output pin, while clearing a PAODR bit to 0 makes the corresponding pin a CMOS output pin. |
| 6   | PA6ODR   | 0             | R/W |   |
| 5   | PA5ODR   | 0             | R/W |   |
| 4   | PA4ODR   | 0             | R/W |   |
| 3   | PA3ODR   | 0             | R/W |   |
| 2   | PA2ODR   | 0             | R/W |   |
| 1   | PA1ODR   | 0             | R/W |   |
| 0   | PA0ODR   | 0             | R/W |   |

Note: \* Not supported in the H8S/2426 Group and the H8S/2426R Group

## 10.9.6 Pin Functions

Port A pins also function as the pins for address outputs, interrupt inputs, SSU I/Os, SCI I/Os, and bus control signal outputs. The correspondence between the register specification and the pin functions is shown below.

- PA7/A23/ $\overline{CS7}^{*4}$ / $\overline{IRQ7-A}$ /SSO0-B

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, bits MSS and BIDE in SSCRH, bit SSUMS in SSCRL, and bits TE and RE in SSER of the SSU, bits SSO0S1 and SSO0S0 in PFCR5, bit CS7E<sup>\*4</sup> in PFCR0 (the H8S/2424 Group), bit A23E in PFCR1, bit PA7DDR, and bit ITS7 in ITSR of the interrupt controller.

- Modes 1, 2, 4, and 7 (EXPE = 1)

|                    |   |            |                            |                             |           |                                       |           |            |
|--------------------|---|------------|----------------------------|-----------------------------|-----------|---------------------------------------|-----------|------------|
| A23E               | 0   |            |                            |                             |           |                                       | 1         |            |
| CS7E <sup>*4</sup> | 0   |            |                            | 1                           |           |                                       | —         |            |
| SSU settings       | (1) in table below                                |            | (2) in table below         | (3) in table below          | —         |                                       | —         |            |
| PA7DDR             | 0   | 1          | 0                          | —                           | 0         | 1                                     | 0         | 1          |

| Pin function       | PA7 input                            |  | PA7 output         |  | SSO0-B input* <sup>2</sup> |  |   | SSO0-B output* <sup>3</sup> |  |
|                    | IRQ7-A interrupt input* <sup>1</sup> |  |                    |  |                            |  |   |                             |  |

- Notes:
1. IRQ7-A input when the ITS7 bit in ITSr is 0.
  2. SSO0-B input when SSO0S1 and SSO0S0 = B'01 in PFCR5.
  3. SSO0-B output when SSO0S1 and SSO0S0 = B'01 in PFCR5.
  4. Supported only in the H8S/2424 Group and not supported in the H8S/2426 and H8S/2426R Groups.

|              |           |     |           |     |            |            |           |            |           |            |     |            |            |     |            |            |  |

[Legend]

—: Not used as the SSU pin (can be used as an I/O port).

- PA6/A22/ $\overline{\text{IRQ6-A}}$ /SSI0-B

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, bits MSS and BIDE in SSCRH, bit SSUMS in SSCRL, and bits TE and RE in SSER of SSU, bit A22E in PFCR1, bits SSI0S1 and SSI0S0 in PFCR5, bit PA6DDR, and bit ITS6 in ITSr of the interrupt controller.

- Modes 1, 2, and 4

[Legend]

x: Don't care

—: Not used as the SSU pin (can be used as an I/O port).

- PA3/A19/SCK4-B

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, bit  $C/\bar{A}$  in SMR\_4 and bits CKE0 and CKE1 in SCR\_4 of the SCI, bit A19E in PFCR1, bit SCK4S in PFCR4, and bit PA3DDR.

### 10.9.7 Port A Input Pull-Up MOS States

Port A has a built-in input pull-up MOS function that can be controlled by software. This input pull-up MOS function can be used by pins PA7 to PA5 in modes 1 and 2, and by all pins in modes 4 and 7. The input pull-up MOS can be specified as on or off on a bit-by-bit basis.

Table 10.3 summarizes the input pull-up MOS states. The input pull-up MOS should not be turned on when the SCI is used.

**Table 10.3 Input Pull-Up MOS States for Port A**

| Mode   | Reset      | Hardware Standby Mode | Software Standby Mode | In Other Operations |
|--------|------------|-----------------------|-----------------------|---------------------|
| 4 or 7 | PA7 to PA0 | Off                   | Off                   | On/Off              |
| 1 or 2 | PA7 to PA5 |                       |                       | On/Off              |
|        | PA4 to PA0 |                       |                       | Off                 |

[Legend]

Off: Input pull-up MOS is always off.

On/Off: Input pull-up MOS is on when in input port register state and PAPCR = 1; otherwise off.

## 10.10 Port B

Port B is an 8-bit I/O port that also has other functions. Port B has the following registers.

- Port B data direction register (PBDDR)
- Port B data register (PBDR)
- Port B register (PORTB)
- Port B pull-up MOS control register (PBPCR)
- Port B open drain control register (PBODR)

### 10.10.1 Port B Data Direction Register (PBDDR)

The individual bits of PBDDR specify input or output for the pins of port B. PBDDR cannot be read; if it is, an undefined value will be read.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | PB7DDR   | 0             | W   | • Modes 1 and 2<br>Port B pins are address outputs regardless of the PBDDR settings.  |
| 6   | PB6DDR   | 0             | W   |   |
| 5   | PB5DDR   | 0             | W   | • Modes 7 (when EXPE = 1) and 4<br>Setting a PBDDR bit to 1 makes the corresponding pin an address output, while clearing a PBDDR bit to 0 makes the corresponding pin an input port. |
| 4   | PB4DDR   | 0             | W   |   |
| 3   | PB3DDR   | 0             | W   |   |
| 2   | PB2DDR   | 0             | W   | • Mode 7 (when EXPE = 0)<br>Port B is an I/O port, and its pin functions can be switched with PBDDR.  |
| 1   | PB1DDR   | 0             | W   |   |
| 0   | PB0DDR   | 0             | W   |   |

### 10.10.2 Port B Data Register (PBDR)

PBDR stores output data for the port B pins.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | PB7DR    | 0             | R/W | Output data for a pin is stored when the pin function is specified as a general purpose I/O. |
| 6   | PB6DR    | 0             | R/W |  |
| 5   | PB5DR    | 0             | R/W |  |
| 4   | PB4DR    | 0             | R/W |  |
| 3   | PB3DR    | 0             | R/W |  |
| 2   | PB2DR    | 0             | R/W |  |
| 1   | PB1DR    | 0             | R/W |  |
| 0   | PB0DR    | 0             | R/W |  |

### 10.10.3 Port B Register (PORTB)

PORTB shows the pin states of port B. PORTB cannot be modified.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | PB7      | —*            | R   | If this register is read while a PBDDR bit is set to 1, the corresponding PBDR value is read. If this register is read while a PBDDR bit is cleared to 0, the corresponding pin state is read. |
| 6   | PB6      | —*            | R   |  |
| 5   | PB5      | —*            | R   |  |
| 4   | PB4      | —*            | R   |  |
| 3   | PB3      | —*            | R   |  |
| 2   | PB2      | —*            | R   |  |
| 1   | PB1      | —*            | R   |  |
| 0   | PB0      | —*            | R   |  |

Note: \* Determined by the states of pins PB7 to PB0.

### 10.10.4 Port B Pull-Up MOS Control Register (PBPCR)

PBPCR controls on/off of the input pull-up MOS for port B. PBPCR is valid in modes 4 and 7.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | PB7PCR   | 0             | R/W | When in a input port register state, setting the corresponding bit to 1 turns on the input pull-up MOS for that pin. |
| 6   | PB6PCR   | 0             | R/W |  |
| 5   | PB5PCR   | 0             | R/W |  |
| 4   | PB4PCR   | 0             | R/W |  |
| 3   | PB3PCR   | 0             | R/W |  |
| 2   | PB2PCR   | 0             | R/W |  |
| 1   | PB1PCR   | 0             | R/W |  |
| 0   | PB0PCR   | 0             | R/W |  |

### 10.10.5 Port B Open Drain Control Register (PBODR)

PBODR specifies the output type of each port B pin.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | PB7ODR   | 0             | R/W | When not specified for address output, setting a PBODR bit to 1 makes the corresponding pin an NMOS open-drain output pin, while clearing a PBODR bit to 0 makes the corresponding pin a CMOS output pin. |
| 6   | PB6ODR   | 0             | R/W |   |
| 5   | PB5ODR   | 0             | R/W |   |
| 4   | PB4ODR   | 0             | R/W |   |
| 3   | PB3ODR   | 0             | R/W |   |
| 2   | PB2ODR   | 0             | R/W |   |
| 1   | PB1ODR   | 0             | R/W |   |
| 0   | PB0ODR   | 0             | R/W |   |

## 10.10.6 Pin Functions

Port B pins also function as the pins for TPU I/Os and address outputs. The correspondence between the register specification and the pin functions is shown below.

- PB7/A15/TIOCB8/TCLKH

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, TPU channel 8 settings (by bits MD3 to MD0 in TMDR\_8, bits IOB3 to IOB0 in TIOR\_8, and bits CCLR1 and CCLR0 in TCR\_8), bits TPSC2 to TPSC0 in TCR\_6 and TCR\_11, and bit PB7DDR.

| Operating mode            | 1, 2       | 4, 7 (EXPE = 1) |            | 7 (EXPE = 0)       |                            |            |
|---------------------------|------------|-----------------|------------|--------------------|----------------------------|------------|
| TPU channel 8 settings    | —          | —               |            | (1) in table below | (2) in table below         |            |
| PB7DDR                    | —          | 0               | 1          | —                  | 0                          | 1          |
| Pin function              | A15 output | PB7 input       | A15 output | TIOCB8 output      | PB7 input                  | PB7 output |
|                           |            |                 |            |                    | TIOCB8 input* <sup>1</sup> |            |
| TCLKH input* <sup>2</sup> |            |                 |            |                    |                            |            |

| TPU channel 8 settings | (2)                    | (1)                                | (2)    | (2)    | (1)               | (2)  |
|------------------------|------------------------|------------------------------------|--------|--------|-------------------|------|
| MD3 to MD0             | B'0000, B'01xx         |                                    | B'0010 | B'0011 |                   |      |
| IOB3 to IOB0           | B'0000, B'0100, B'1xxx | B'0001 to B'0011, B'0101 to B'0111 | —      | B'xx00 | Other than B'xx00 |      |
| CCLR1, CCLR0           | —                      | —                                  | —      | —      | Other than B'10   | B'10 |
| Output function        | —                      | Output compare output              | —      | —      | PWM mode 2 output | —    |

[Legend]

x: Don't care

Notes: 1. TIOCB8 input when MD3 to MD0 = B'0000 or B'01xx and IOB3 = 1.

2. TCLKH input when the setting for either TCR\_6 or TCR\_11 is TPSC2 to TPSC0 = B'111. TCLKH input when phase counting mode is set for channels 8 and 10.

- PB6/A14/TIOCA8

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, TPU channel 8 settings (by bits MD3 to MD0 in TMDR\_8, bits IOA3 to IOA0 in TIOR\_8, and bits CCLR1 and CCLR0 in TCR\_8), and bit PB6DDR.

| Operating mode         | 1, 2       | 4, 7 (EXPE = 1) |            | 7 (EXPE = 0)       |                            |            |
|------------------------|------------|-----------------|------------|--------------------|----------------------------|------------|
| TPU channel 8 settings | —          | —               |            | (1) in table below | (2) in table below         |            |
| PB6DDR                 | —          | 0               | 1          | —                  | 0                          | 1          |
| Pin function           | A14 output | PB6 input       | A14 output | TIOCA8 output      | PB6 input                  | PB6 output |
|                        |            |                 |            |                    | TIOCA8 input* <sup>1</sup> |            |

| TPU channel 8 settings | (2)                    | (1)                                | (2)    | (1)                             | (1)               | (2)  |
|------------------------|------------------------|------------------------------------|--------|---------------------------------|-------------------|------|
| MD3 to MD0             | B'0000, B'01xx         |                                    | B'001x | B'0010                          | B'0011            |      |
| IOA3 to IOA0           | B'0000, B'0100, B'1xxx | B'0001 to B'0011, B'0101 to B'0111 | B'xx00 | Other than B'xx00               |                   |      |
| CCLR1, CCLR0           | —                      | —                                  | —      | —                               | Other than B'01   | B'01 |
| Output function        | —                      | Output compare output              | —      | PWM* <sup>2</sup> mode 1 output | PWM mode 2 output | —    |

[Legend]

x: Don't care

- Notes: 1. TIOCA8 input when MD3 to MD0 = B'0000 or B'01xx and IOA3 = 1.  
2. TIOCB8 output disabled.

- PB5/A13/TIOCB7/TCLKG

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, TPU channel 7 settings (by bits MD3 to MD0 in TMDR\_7, bits IOB3 to IOB0 in TIOR\_7, and bits CCLR1 and CCLR0 in TCR\_7), bits TPSC2 to TPSC0 in TCR\_6, TCR\_8, TCR\_10, and TCR\_11, and bit PB5DDR.

| Operating mode            | 1, 2       | 4, 7 (EXPE = 1) |            | 7 (EXPE = 0)       |                            |            |
|---------------------------|------------|-----------------|------------|--------------------|----------------------------|------------|
| TPU channel 7 settings    | —          | —               |            | (1) in table below | (2) in table below         |            |
| PB5DDR                    | —          | 0               | 1          | —                  | 0                          | 1          |
| Pin function              | A13 output | PB5 input       | A13 output | TIOCB7 output      | PB5 input                  | PB5 output |
|                           |            |                 |            |                    | TIOCB7 input* <sup>1</sup> |            |
| TCLKG input* <sup>2</sup> |            |                 |            |                    |                            |            |

| TPU channel 7 settings | (2)                    | (1)                                | (2)    | (2)    | (1)               | (2)  |
|------------------------|------------------------|------------------------------------|--------|--------|-------------------|------|
| MD3 to MD0             | B'0000, B'01xx         |                                    | B'0010 | B'0011 |                   |      |
| IOB3 to IOB0           | B'0000, B'0100, B'1xxx | B'0001 to B'0011, B'0101 to B'0111 | —      | B'xx00 | Other than B'xx00 |      |
| CCLR1, CCLR0           | —                      | —                                  | —      | —      | Other than B'10   | B'10 |
| Output function        | —                      | Output compare output              | —      | —      | PWM mode 2 output | —    |

[Legend]

x: Don't care

- Notes:
1. TIOCB7 input when MD3 to MD0 = B'0000 or B'01xx and IOB3 to IOB0 = B'10xx.
  2. TCLKG input when the setting for either TCR\_6 or TCR\_8 is TPSC2 to TPSC0 = B'111, or when the setting for either TCR\_10 or TCR\_11 is TPSC2 to TPSC0 = B'101. TCLKG input when phase counting mode is set for channels 8 and 10.

- PB4/A12/TIOCA7

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, TPU channel 7 settings (by bits MD3 to MD0 in TMDR\_7, bits IOA3 to IOA0 in TIOR\_7, and bits CCLR1 and CCLR0 in TCR\_7), and bit PB4DDR.

| Operating mode         | 1, 2       | 4, 7 (EXPE = 1) |            | 7 (EXPE = 0)       |                            |            |
|------------------------|------------|-----------------|------------|--------------------|----------------------------|------------|
| TPU channel 7 settings | —          | —               |            | (1) in table below | (2) in table below         |            |
| PB4DDR                 | —          | 0               | 1          | —                  | 0                          | 1          |
| Pin function           | A12 output | PB4 input       | A12 output | TIOCA7 output      | PB4 input                  | PB4 output |
|                        |            |                 |            |                    | TIOCA7 input* <sup>1</sup> |            |

| TPU channel 7 settings | (2)                    | (1)                                | (2)    | (1)                             | (1)               | (2)  |
|------------------------|------------------------|------------------------------------|--------|---------------------------------|-------------------|------|
| MD3 to MD0             | B'0000, B'01xx         |                                    | B'001x | B'0010                          | B'0011            |      |
| IOA3 to IOA0           | B'0000, B'0100, B'1xxx | B'0001 to B'0011, B'0101 to B'0111 | B'xx00 | Other than B'xx00               |                   |      |
| CCLR1, CCLR0           | —                      | —                                  | —      | —                               | Other than B'01   | B'01 |
| Output function        | —                      | Output compare output              | —      | PWM* <sup>2</sup> mode 1 output | PWM mode 2 output | —    |

[Legend]

x: Don't care

- Notes: 1. TIOCA7 input when MD3 to MD0 = B'0000 or B'01xx and IOA3 to IOA0 = B'10xx.  
2. TIOCB7 output disabled.

- PB3/A11/TIOCD6/TCLKF

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, TPU channel 6 settings (by bits MD3 to MD0 in TMDR\_6, bits IOD3 to IOD0 in TIORL\_6, and bits CCLR2 to CCLR0 in TCR\_6), bits TPSC2 to TPSC0 in TCR\_6 to TCR\_8, and bit PB3DDR.

| Operating mode            | 1, 2       | 4, 7 (EXPE = 1) |            | 7 (EXPE = 0)       |                            |            |
|---------------------------|------------|-----------------|------------|--------------------|----------------------------|------------|
| TPU channel 6 settings    | —          | —               |            | (1) in table below | (2) in table below         |            |
| PB3DDR                    | —          | 0               | 1          | —                  | 0                          | 1          |
| Pin function              | A11 output | PB3 input       | A11 output | TIOCD6 output      | PB3 input                  | PB3 output |
|                           |            |                 |            |                    | TIOCD6 input* <sup>1</sup> |            |
| TCLKF input* <sup>2</sup> |            |                 |            |                    |                            |            |

| TPU channel 6 settings | (2)                    | (1)                                | (2)    | (2)    | (1)               | (2)   |
|------------------------|------------------------|------------------------------------|--------|--------|-------------------|-------|
| MD3 to MD0             | B'0000                 |                                    | B'0010 | B'0011 |                   |       |
| IOD3 to IOD0           | B'0000, B'0100, B'1xxx | B'0001 to B'0011, B'0101 to B'0111 | —      | B'xx00 | Other than B'xx00 |       |
| CCLR2 to CCLR0         | —                      | —                                  | —      | —      | Other than B'110  | B'110 |
| Output function        | —                      | Output compare output              | —      | —      | PWM mode 2 output | —     |

[Legend]

x: Don't care

- Notes:
1. TIOCD6 input when MD3 to MD0 = B'0000 and IOD3 to IOD0 = B'10xx.
  2. TCLKF input when the setting for any of TCR\_6 to TCR\_8 is TPSC2 to TPSC0 = B'101. TCLKF input when phase counting mode is set for channels 7 and 11.

- PB2/A10/TIOCC6/TCLKE

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, TPU channel 6 settings (by bits MD3 to MD0 in TMDR\_6, bits IOC3 to IOC0 in TIORL\_6, and bits CCLR2 to CCLR0 in TCR\_6), bits TPSC2 to TPSC0 in TCR\_6 to TCR\_11, and bit PB2DDR.

| Operating mode         | 1, 2       | 4, 7 (EXPE = 1) |            | 7 (EXPE = 0)              |                            |            |
|------------------------|------------|-----------------|------------|---------------------------|----------------------------|------------|
| TPU channel 6 settings | —          | —               |            | (1) in table below        | (2) in table below         |            |
| PB2DDR                 | —          | 0               | 1          | —                         | 0                          | 1          |

| Output function        | —                      | Output compare output              | —      | PWM* <sup>2</sup> mode 1 output | PWM mode 2 output | —     |

[Legend]

x: Don't care

Notes: 1. TIOCA6 input when MD3 to MD0 = B'0000 and IOA3 to IOA0 = B'10xx.

2. TIOCB6 output disabled.

### 10.10.7 Port B Input Pull-Up MOS States

Port B has a built-in input pull-up MOS function that can be controlled by software. This input pull-up MOS function can be used in modes 4 and 7. The input pull-up MOS can be specified as on or off on a bit-by-bit basis.

In modes 4 and 7, when a PBDDR bit is cleared to 0, setting the corresponding PBPCR bit to 1 turns on the input pull-up MOS for that pin.

Table 10.4 summarizes the input pull-up MOS states.

**Table 10.4 Input Pull-Up MOS States for Port B**

| Mode   | Reset | Hardware Standby Mode | Software Standby Mode | In Other Operations |
|--------|-------|-----------------------|-----------------------|---------------------|
| 1 or 2 | Off   | Off                   | Off                   | Off                 |
| 4 or 7 |       |                       | On/Off                | On/Off              |

[Legend]

Off: Input pull-up MOS is always off.

On/Off: Input pull-up MOS is on when in an input port state 0 and PBPCR = 1; otherwise off.

## 10.11 Port C

Port C is an 8-bit I/O port that also has other functions. Port C has the following registers.

- Port C data direction register (PCDDR)
- Port C data register (PCDR)
- Port C register (PORTC)
- Port C pull-up MOS control register (PCPCR)
- Port C open drain control register (PCODR)

### 10.11.1 Port C Data Direction Register (PCDDR)

The individual bits of PCDDR specify input or output for the pins of port C. PCDDR cannot be read; if it is, an undefined value will be read.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | PC7DDR   | 0             | W   | • Modes 1 and 2  |
| 6   | PC6DDR   | 0             | W   | Port C pins are address outputs regardless of the PCDDR settings.  |
| 5   | PC5DDR   | 0             | W   |  |
| 4   | PC4DDR   | 0             | W   | • Modes 7 (when EXPE = 1) and 4  |
| 3   | PC3DDR   | 0             | W   | Setting a PCDDR bit to 1 makes the corresponding pin an address output, while clearing a PCDDR to 0 makes the corresponding pin an input port. |
| 2   | PC2DDR   | 0             | W   |  |
| 1   | PC1DDR   | 0             | W   | • Mode 7 (when EXPE = 0)<br>Port C is an I/O port, and its pin functions can be switched with PCDDR.   |
| 0   | PC0DDR   | 0             | W   |  |

### 10.11.2 Port C Data Register (PCDR)

PCDR stores output data for the port C pins.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | PC7DR    | 0             | R/W | Output data for a pin is stored when the pin function is specified as a general purpose I/O. |
| 6   | PC6DR    | 0             | R/W |  |
| 5   | PC5DR    | 0             | R/W |  |
| 4   | PC4DR    | 0             | R/W |  |
| 3   | PC3DR    | 0             | R/W |  |
| 2   | PC2DR    | 0             | R/W |  |
| 1   | PC1DR    | 0             | R/W |  |
| 0   | PC0DR    | 0             | R/W |  |

### 10.11.3 Port C Register (PORTC)

PORTC shows the pin states of port C. PORTC cannot be modified.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | PC7      | —*            | R   | If this register is read while a PCDDR bit is set to 1, the corresponding PCDR value is read. If this register is read while a PCDDR bit is cleared to 0, the corresponding pin state is read. |
| 6   | PC6      | —*            | R   |  |
| 5   | PC5      | —*            | R   |  |
| 4   | PC4      | —*            | R   |  |
| 3   | PC3      | —*            | R   |  |
| 2   | PC2      | —*            | R   |  |
| 1   | PC1      | —*            | R   |  |
| 0   | PC0      | —*            | R   |  |

Note: \* Determined by the states of pins PC7 to PC0.

### 10.11.4 Port C Pull-Up MOS Control Register (PCPCR)

PCPCR controls on/off of the input pull-up MOS for port C. PCPCR is valid in modes 4 and 7.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | PC7PCR   | 0             | R/W | When in a input port state, setting the corresponding bit to 1 turns on the input pull-up MOS for that pin. |
| 6   | PC6PCR   | 0             | R/W |   |
| 5   | PC5PCR   | 0             | R/W |   |
| 4   | PC4PCR   | 0             | R/W |   |
| 3   | PC3PCR   | 0             | R/W |   |
| 2   | PC2PCR   | 0             | R/W |   |
| 1   | PC1PCR   | 0             | R/W |   |
| 0   | PC0PCR   | 0             | R/W |   |

### 10.11.5 Port C Open Drain Control Register (PCODR)

PCODR specifies the output type of each port C pin.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | PC7ODR   | 0             | R/W | When not specified for address output, setting a PCODR bit to 1 makes the corresponding pin an NMOS open-drain output pin, while clearing a PCODR bit to 0 makes the corresponding pin a CMOS output pin. |
| 6   | PC6ODR   | 0             | R/W |   |
| 5   | PC5ODR   | 0             | R/W |   |
| 4   | PC4ODR   | 0             | R/W |   |
| 3   | PC3ODR   | 0             | R/W |   |
| 2   | PC2ODR   | 0             | R/W |   |
| 1   | PC1ODR   | 0             | R/W |   |
| 0   | PC0ODR   | 0             | R/W |   |

## 10.11.6 Pin Functions

Port C pins also function as the pins for TPU I/Os and address outputs. The correspondence between the register specification and the pin functions is shown below.

- PC7/A7/TIOCB11

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, TPU channel 11 settings (by bits MD3 to MD0 in TMDR\_11, bits IOB3 to IOB0 in TIOR\_11, and bits CCLR1 and CCLR0 in TCR\_11), and bit PC7DDR.

| Operating mode          | 1, 2      | 4, 7 (EXPE = 1) |           | 7 (EXPE = 0)       |                    |            |

| MD3 to MD0             | B'0000                 |                                    | B'001x | B'0010                          | B'0011            |       |
| IOA3 to IOA0           | B'0000, B'0100, B'1xxx | B'0001 to B'0011, B'0101 to B'0111 | B'xx00 | Other than B'xx00               |                   |       |
| CCLR2 to CCLR0         | —                      | —                                  | —      | —                               | Other than B'001  | B'001 |
| Output function        | —                      | Output compare output              | —      | PWM* <sup>2</sup> mode 1 output | PWM mode 2 output | —     |

[Legend]

x: Don't care

Notes: 1. TIOCA9 input when MD3 to MD0 = B'0000 and IOA3 to IOA0 = B'10xx.

2. TIOCB9 output disabled.

### 10.11.7 Port C Input Pull-Up MOS States

Port C has a built-in input pull-up MOS function that can be controlled by software. This input pull-up MOS function can be used in modes 4 and 7. The input pull-up MOS can be specified as on or off on a bit-by-bit basis.

In modes 4 and 7, when a PCDDR bit is cleared to 0, setting the corresponding PCPCR bit to 1 turns on the input pull-up MOS for that pin.

Table 10.5 summarizes the input pull-up MOS states.

**Table 10.5 Input Pull-Up MOS States for Port C**

| Mode   | Reset | Hardware Standby Mode | Software Standby Mode | In Other Operations |
|--------|-------|-----------------------|-----------------------|---------------------|
| 1 or 2 | Off   | Off                   | Off                   | Off                 |
| 4 or 7 |       |                       | On/Off                | On/Off              |

[Legend]

Off: Input pull-up MOS is always off.

On/Off: Input pull-up MOS is on when in an input port state and PCPCR = 1; otherwise off.

## 10.12 Port D

Port D is an 8-bit I/O port that also has other functions. Port D has the following registers.

- Port D data direction register (PDDDR)
- Port D data register (PDDR)
- Port D register (PORTD)
- Port D pull-up MOS control register (PDPCR)
- Port D open drain control register (PDODR)

### 10.12.1 Port D Data Direction Register (PDDDR)

The individual bits of PDDDR specify input or output for the pins of port D. PDDDR cannot be read; if it is, an undefined value will be read.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | PD7DDR   | 0             | W   | <ul style="list-style-type: none"> <li>• Modes 7 (when EXPE = 1), 1, 2, and 4</li> </ul>  |
| 6   | PD6DDR   | 0             | W   |   |
| 5   | PD5DDR   | 0             | W   |   |
| 4   | PD4DDR   | 0             | W   |   |
| 3   | PD3DDR   | 0             | W   | <ul style="list-style-type: none"> <li>• Mode 7 (when EXPE = 0)</li> </ul> Port D is an I/O port, and its pin functions can be switched with PDDDR. |
| 2   | PD2DDR   | 0             | W   |   |
| 1   | PD1DDR   | 0             | W   |   |
| 0   | PD0DDR   | 0             | W   |   |

### 10.12.2 Port D Data Register (PDDR)

PDDR stores output data for the port D pins.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | PD7DR    | 0             | R/W | Output data for a pin is stored when the pin function is specified as a general purpose I/O. |
| 6   | PD6DR    | 0             | R/W |  |
| 5   | PD5DR    | 0             | R/W |  |
| 4   | PD4DR    | 0             | R/W |  |
| 3   | PD3DR    | 0             | R/W |  |
| 2   | PD2DR    | 0             | R/W |  |
| 1   | PD1DR    | 0             | R/W |  |
| 0   | PD0DR    | 0             | R/W |  |

### 10.12.3 Port D Register (PORTD)

PORTD shows the pin states of port D. PORTD cannot be modified.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | PD7      | —*            | R   | If this register is read while a PDDR bit is set to 1, the corresponding PDDR value is read. If this register is read while a PDDR bit is cleared to 0, the corresponding pin state is read. |
| 6   | PD6      | —*            | R   |  |
| 5   | PD5      | —*            | R   |  |
| 4   | PD4      | —*            | R   |  |
| 3   | PD3      | —*            | R   |  |
| 2   | PD2      | —*            | R   |  |
| 1   | PD1      | —*            | R   |  |
| 0   | PD0      | —*            | R   |  |

Note: \* Determined by the states of pins PD7 to PD0.

### 10.12.4 Port D Pull-Up MOS Control Register (PDPCR)

PDPCR controls on/off of the input pull-up MOS for port D. PDPCR is valid in mode 7.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | PD7PCR   | 0             | R/W | When PDDDR = 0 (input port), setting the corresponding bit to 1 turns on the input pull-up MOS for that pin. |
| 6   | PD6PCR   | 0             | R/W |  |
| 5   | PD5PCR   | 0             | R/W |  |
| 4   | PD4PCR   | 0             | R/W |  |
| 3   | PD3PCR   | 0             | R/W |  |
| 2   | PD2PCR   | 0             | R/W |  |
| 1   | PD1PCR   | 0             | R/W |  |
| 0   | PD0PCR   | 0             | R/W |  |

### 10.12.5 Port D Open Drain Control Register (PDODR)

PDODR specifies the output type of each port D pin.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | PD7ODR   | 0             | R/W | When not specified for data or address output, setting a PDODR bit to 1 makes the corresponding pin an NMOS open-drain output pin, while clearing a PDODR bit to 0 makes the corresponding pin a CMOS output pin. |
| 6   | PD6ODR   | 0             | R/W |   |
| 5   | PD5ODR   | 0             | R/W |   |
| 4   | PD4ODR   | 0             | R/W |   |
| 3   | PD3ODR   | 0             | R/W |   |
| 2   | PD2ODR   | 0             | R/W |   |
| 1   | PD1ODR   | 0             | R/W |   |
| 0   | PD0ODR   | 0             | R/W |   |

## 10.12.6 Pin Functions

Port D pins also function as the pins for data I/Os and address outputs. The correspondence between the register specification and the pin functions is shown below.

- PD7/D15/AD15, PD6/D14/AD14, PD5/D13/AD13, PD4/D12/AD12, PD3/D11/AD11, PD2/D10/AD10, PD1/D9/AD9, PD0/D8/AD8

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, bit MPXE in MPXCR of the bus controller, and bit PDnDDR.

|                |          |                             |           |            |          |                             |
|----------------|----------|-----------------------------|-----------|------------|----------|-----------------------------|
| Operating mode | 1, 2, 4  |                             | 7         |            |          |                             |
| EXPE           | —        |                             | 0         |            | 1        |                             |
| MPXE           | 0        | 1                           | —         |            | 0        | 1                           |
| PDnDDR         | —        |                             | 0         | 1          | —        |                             |
| Pin function   | Data I/O | Address output/<br>data I/O | PDn input | PDn output | Data I/O | Address output/<br>data I/O |

[Legend]

n = 7 to 0

### 10.12.7 Port D Input Pull-Up MOS States

Port D has a built-in input pull-up MOS function that can be controlled by software. This input pull-up MOS function can be used in mode 7. The input pull-up MOS can be specified as on or off on a bit-by-bit basis.

In mode 7, when a PDDDR bit is cleared to 0, setting the corresponding PDPCR bit to 1 turns on the input pull-up MOS for that pin.

Table 10.6 summarizes the input pull-up MOS states.

**Table 10.6 Input Pull-Up MOS States for Port D**

| Mode       | Reset | Hardware Standby Mode | Software Standby Mode | In Other Operations |
|------------|-------|-----------------------|-----------------------|---------------------|
| 1, 2, or 4 | Off   | Off                   | Off                   | Off                 |
| 7          |       |                       | On/Off                | On/Off              |

[Legend]

Off: Input pull-up MOS is always off.

On/Off: Input pull-up MOS is on when PDDDR = 0 and PDPCR = 1; otherwise off.

## 10.13 Port E

Port E is an 8-bit I/O port that also has other functions. Port E has the following registers.

- Port E data direction register (PEDDR)
- Port E data register (PEDR)
- Port E register (PORTE)
- Port E pull-up MOS control register (PEPCR)
- Port E open drain control register (PEODR)

### 10.13.1 Port E Data Direction Register (PEDDR)

The individual bits of PEDDR specify input or output for the pins of port E. PEDDR cannot be read; if it is, an undefined value will be read.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | PE7DDR   | 0             | W   | <ul style="list-style-type: none"> <li>• Modes 1, 2, and 4</li> </ul>  |
| 6   | PE6DDR   | 0             | W   |  |
| 5   | PE5DDR   | 0             | W   | When 8-bit bus mode is selected, port E is an I/O port, and its pin functions can be switched with PEDDR.  |
| 4   | PE4DDR   | 0             | W   |  |
| 3   | PE3DDR   | 0             | W   | When 16-bit bus mode is selected, port E is designated for data input/output.  |
| 2   | PE2DDR   | 0             | W   |  |
| 1   | PE1DDR   | 0             | W   | For details on 8-bit and 16-bit bus modes, see section 6, Bus Controller (BSC).  |
| 0   | PE0DDR   | 0             | W   |  |
|     |          |               |     | <ul style="list-style-type: none"> <li>• Mode 7 (when EXPE = 1)</li> </ul> When 8-bit bus mode is selected, port E is an I/O port. Setting a PEDDR bit to 1 makes the corresponding pin an output port, while clearing a PEDDR bit to 0 makes the corresponding pin an input port. |
|     |          |               |     | When 16-bit bus mode is selected, port E is designated for data input/output.  |
|     |          |               |     | <ul style="list-style-type: none"> <li>• Mode 7 (when EXPE = 0)</li> </ul> Port E is an I/O port, and its pin functions can be switched with PEDDR.  |

### 10.13.2 Port E Data Register (PEDR)

PEDR stores output data for the port E pins.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | PE7DR    | 0             | R/W | Output data for a pin is stored when the pin function is specified as a general purpose I/O. |
| 6   | PE6DR    | 0             | R/W |  |
| 5   | PE5DR    | 0             | R/W |  |
| 4   | PE4DR    | 0             | R/W |  |
| 3   | PE3DR    | 0             | R/W |  |
| 2   | PE2DR    | 0             | R/W |  |
| 1   | PE1DR    | 0             | R/W |  |
| 0   | PE0DR    | 0             | R/W |  |

### 10.13.3 Port E Register (PORTE)

PORTE shows the pin states of port E. PORTE cannot be modified.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | PE7      | —*            | R   | If this register is read while a PEDDR bit is set to 1, the corresponding PEDR value is read. If this register is read while a PEDDR bit is cleared to 0, the corresponding pin state is read. |
| 6   | PE6      | —*            | R   |  |
| 5   | PE5      | —*            | R   |  |
| 4   | PE4      | —*            | R   |  |
| 3   | PE3      | —*            | R   |  |
| 2   | PE2      | —*            | R   |  |
| 1   | PE1      | —*            | R   |  |
| 0   | PE0      | —*            | R   |  |

Note: \* Determined by the states of pins PE7 to PE0.

### 10.13.4 Port E Pull-Up MOS Control Register (PEPCR)

PEPCR controls on/off of the input pull-up MOS for port E. PEPCR is valid in 8-bit bus mode.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | PE7PCR   | 0             | R/W | When PEDDR = 0 (input port), setting the corresponding bit to 1 turns on the input pull-up MOS for that pin. |
| 6   | PE6PCR   | 0             | R/W |  |
| 5   | PE5PCR   | 0             | R/W |  |
| 4   | PE4PCR   | 0             | R/W |  |
| 3   | PE3PCR   | 0             | R/W |  |
| 2   | PE2PCR   | 0             | R/W |  |
| 1   | PE1PCR   | 0             | R/W |  |
| 0   | PE0PCR   | 0             | R/W |  |

### 10.13.5 Port E Open Drain Control Register (PEODR)

PEODR specifies the output type of each port E pin.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | PE7ODR   | 0             | R/W | When not specified for data or address output, setting a PEODR bit to 1 makes the corresponding pin an NMOS open-drain output pin, while clearing a PEODR bit to 0 makes the corresponding pin a CMOS output pin. |
| 6   | PE6ODR   | 0             | R/W |   |
| 5   | PE5ODR   | 0             | R/W |   |
| 4   | PE4ODR   | 0             | R/W |   |
| 3   | PE3ODR   | 0             | R/W |   |
| 2   | PE2ODR   | 0             | R/W |   |
| 1   | PE1ODR   | 0             | R/W |   |
| 0   | PE0ODR   | 0             | R/W |   |

### 10.13.6 Pin Functions

Port E pins also function as the pins for data I/Os and address outputs. The correspondence between the register specification and the pin functions is shown below.

- PE7/D7/AD7, PE6/D6/AD6, PE5/D5/AD5, PE4/D4/AD4, PE3/D3/AD3, PE2/D2/AD2, PE1/D1/AD1, PE0/D0/AD0

The pin function is switched as shown below according to the combination of the operating mode, bus mode, bit EXPE, and bit PEnDDR of the bus controller.

| Operating mode | 1, 2, 4                   |            |                                   |                             | 7         |            |                           |            |                                   |                             |
|----------------|---------------------------|------------|-----------------------------------|-----------------------------|-----------|------------|---------------------------|------------|-----------------------------------|-----------------------------|
| Bus mode       | All areas are 8-bit space |            | At least one area is 16-bit space |                             | —         |            | All areas are 8-bit space |            | At least one area is 16-bit space |                             |
| EXPE           | —                         |            | —                                 |                             | 0         |            | 1                         |            | 1                                 |                             |
| MPXE           | —                         |            | 0                                 | 1                           | —         |            | —                         |            | 0                                 | 1                           |

| Pin function   | PEn input                 | PEn output | Data I/O                          | Address output/<br>data I/O | PEn input | PEn output | PEn input                 | PEn output | Data I/O                          | Address output/<br>data I/O |

[Legend]

n = 7 to 0

### 10.13.7 Port E Input Pull-Up MOS States

Port E has a built-in input pull-up MOS function that can be controlled by software. This input pull-up MOS function can be used in 8-bit bus mode. The input pull-up MOS can be specified as on or off on a bit-by-bit basis. In 8-bit bus mode, when a PEDDR bit is cleared to 0, setting the corresponding PEPCR bit to 1 turns on the input pull-up MOS for that pin.

Table 10.7 summarizes the input pull-up MOS states.

**Table 10.7 Input Pull-Up MOS States for Port E**

| <b>Mode</b> |            | <b>Reset</b> | <b>Hardware Standby Mode</b> | <b>Software Standby Mode</b> | <b>In Other Operations</b> |
|-------------|------------|--------------|------------------------------|------------------------------|----------------------------|
| 1, 2, or 4  | 8-bit bus  | Off          | Off                          | On/Off                       | On/Off                     |
|             | 16-bit bus |              |                              | Off                          | Off                        |

[Legend]

Off: Input pull-up MOS is always off.

On/Off: Input pull-up MOS is on when PEDDR = 0 and PEPCR = 1; otherwise off.

## 10.14 Port F

Port F is an 8-bit I/O port that also has other functions. Port F has the following registers. For the port function control registers, refer to section 10.18, Port Function Control Registers.

- Port F data direction register (PFDDR)
- Port F data register (PFDR)
- Port F register (PORTF)
- Port function control register 0 (PFCR0)
- Port function control register 2 (PFCR2)
- Port function control register 4 (PFCR4)
- Port function control register 5 (PFCR5)
- Port F open drain control register (PFODR)

### 10.14.1 Port F Data Direction Register (PFDDR)

The individual bits of PFDDR specify input or output for the pins of port F. PFDDR cannot be read; if it is, an undefined value will be read.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | PF7DDR   | 1/0*          | W   | <ul style="list-style-type: none"> <li>Modes 7 (when EXPE = 1), 1, 2, and 4</li> </ul>  |
| 6   | PF6DDR   | 0             | W   | Pin PF7 functions as the $\phi$ output pin when the corresponding PFDDR bit is set to 1, and as an input port when the bit is cleared to 0.   |
| 5   | PF5DDR   | 0             | W   | Pin PF6 functions as the $\overline{AS}$ output pin when the ASOE bit is set to 1. When the ASOE bit is cleared to 0, pin PF6 is an I/O port and its function can be switched with PF6DDR.  |
| 4   | PF4DDR   | 0             | W   | Pin PF5 functions as the $\overline{LW}$ output pin when the LWROE bit is set to 1. When the LWROE bit is cleared to 0, pin PF5 is an I/O port and its function can be switched with PF5DDR.  |
| 3   | PF3DDR   | 0             | W   | Pin PF4 functions as the $\overline{LC}$ output pin when the LCROE bit is set to 1. When the LCROE bit is cleared to 0, pin PF4 is an I/O port and its function can be switched with PF4DDR.  |
| 2   | PF2DDR   | 0             | W   | Pin PF3 functions as the $\overline{UC}$ output pin when the UCROE bit is set to 1. When the UCROE bit is cleared to 0, pin PF3 is an I/O port and its function can be switched with PF3DDR.  |
| 1   | PF1DDR   | 0             | W   | Pin PF2 functions as the $\overline{UC}$ output pin when the UCROE bit is set to 1. When the UCROE bit is cleared to 0, pin PF2 is an I/O port and its function can be switched with PF2DDR.  |
| 0   | PF0DDR   | 0             | W   | <p>Pins PF2 and PF1 function as bus control output pins (LCAS and UCAS) when the appropriate bus controller settings*<sup>2</sup> are made. Otherwise, operations differ between the H8S/2426 and H8S/2426R Groups and H8S/2424 Group.</p> <p>[H8S/2426 Group and H8S/2426R Group]</p> <p>When pins PF2 and PF1 are general I/O ports, the function can be switched with PFDDR.</p> <p>[H8S/2424 Group]</p> <p>Pins PF2 and PF1 function as <math>\overline{CS}</math> output pins when the <math>\overline{CS}</math> output enable bits (CS6E and CS5E) are set to 1, and as input ports when the bits are cleared to 0. When the <math>\overline{CS}</math> output enable bits (CS6E and CS5E) are cleared to 0 and pins PF2 and PF1 are general I/O ports, the function can be switched with PFDDR.</p> <p>The PF0 pin functions as a bus control input pin (WAIT) when the appropriate bus controller settings are made. Otherwise, PF0 is an I/O port and the function can be switched with PF0DDR.</p> |

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | PF7DDR   | 1/0*          | W   | <ul style="list-style-type: none"> <li>Mode 7 (when EXPE = 0)</li> </ul> Pin PF7 functions as the $\phi$ output pin when the corresponding PFDDR bit is set to 1, and as an input port when the bit is cleared to 0.<br>Pins PF6 to PF0 are I/O ports, and their functions can be switched with PFDDR. |
| 6   | PF6DDR   | 0             | W   |  |
| 5   | PF5DDR   | 0             | W   |  |
| 4   | PF4DDR   | 0             | W   |  |
| 3   | PF3DDR   | 0             | W   |  |
| 2   | PF2DDR   | 0             | W   |  |
| 1   | PF1DDR   | 0             | W   |  |
| 0   | PF0DDR   | 0             | W   |  |

- Notes:
1. PF7DDR is initialized to 1 in modes 1, 2, and 4, and to 0 in mode 7.
  2. Not supported in the 5-V version.

### 10.14.2 Port F Data Register (PFDR)

PFDR stores output data for the port F pins.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | PF7DR    | 0             | R/W | Output data for a pin is stored when the pin function is specified as a general purpose I/O. |
| 6   | PF6DR    | 0             | R/W |  |
| 5   | PF5DR    | 0             | R/W |  |
| 4   | PF4DR    | 0             | R/W |  |
| 3   | PF3DR    | 0             | R/W |  |
| 2   | PF2DR    | 0             | R/W |  |
| 1   | PF1DR    | 0             | R/W |  |
| 0   | PF0DR    | 0             | R/W |  |

### 10.14.3 Port F Register (PORTF)

PORTF shows the pin states of port F. PORTF cannot be modified.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | PF7      | —*            | R   | If this register is read while a PFDDR bit is set to 1, the corresponding PFDR value is read. If this register is read while a PFDDR bit is cleared to 0, the corresponding pin state is read. |
| 6   | PF6      | —*            | R   |  |
| 5   | PF5      | —*            | R   |  |
| 4   | PF4      | —*            | R   |  |
| 3   | PF3      | —*            | R   |  |
| 2   | PF2      | —*            | R   |  |
| 1   | PF1      | —*            | R   |  |
| 0   | PF0      | —*            | R   |  |

Note: \* Determined by the states of pins PF7 to PF0.

### 10.14.4 Port F Open Drain Control Register (PFODR)

PFODR specifies the output type of each port F pin.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | PF7ODR   | 0             | R/W | When not specified for $\phi$ , $\overline{AS}$ , $\overline{AH}$ , $\overline{RD}$ , $\overline{HWR}$ , $\overline{LWR}$ , $\overline{LCAS}^{*3}$ , $\overline{UCAS}^{*3}$ , $\overline{DQML}^{*1}$ , $\overline{DQMU}^{*1}$ , $\overline{CS5}^{*2}$ , $\overline{CS6}^{*2}$ , or $\overline{OE-A}^{*2*3}$ output, setting a PFODR bit to 1 makes the corresponding pin an NMOS open-drain output pin, while clearing a PFODR bit to 0 makes the corresponding pin a CMOS output pin. |
| 6   | PF6ODR   | 0             | R/W |  |
| 5   | PF5ODR   | 0             | R/W |  |
| 4   | PF4ODR   | 0             | R/W |  |
| 3   | PF3ODR   | 0             | R/W |  |
| 2   | PF2ODR   | 0             | R/W |  |
| 1   | PF1ODR   | 0             | R/W |  |
| 0   | PF0ODR   | 0             | R/W |  |

- Notes:
1. Not supported in the H8S/2426 and H8S/2424 Groups.
  2. Not supported in the H8S/2426 and H8S/2426R Groups.
  3. Not supported in the 5-V version.

### 10.14.5 Pin Functions

Port F pins also function as the pins for SSU I/Os, A/D converter inputs, interrupt inputs, bus control signal I/Os, and system clock outputs. The correspondence between the register specification and the pin functions is shown below.

- PF7/ $\phi$

The pin function is switched as shown below according to bit PF7DDR.

|                |            |               |
|----------------|------------|---------------|
| Operating mode | 1, 2, 4, 7 |               |
| PF7DDR         | 0          | 1             |
| Pin function   | PF7 input  | $\phi$ output |

- PF6/ $\overline{AS/AH}$

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, bit MPXE in MPXCR of the bus controller, bit ASOE in PFCR2, and bit PF6DDR.

|                |                             |           |            |           |            |                             |           |            |
|----------------|-----------------------------|-----------|------------|-----------|------------|-----------------------------|-----------|------------|
| Operating mode | 1, 2, 4                     |           |            | 7         |            |                             |           |            |
| EXPE           | —                           |           |            | 0         |            | 1                           |           |            |
| ASOE           | 1                           | 0         |            | —         |            | 1                           | 0         |            |
| PF6DDR         | —                           | 0         | 1          | 0         | 1          | —                           | 0         | 1          |
| Pin function   | $\overline{AS/AH}$ * output | PF6 input | PF6 output | PF6 input | PF6 output | $\overline{AS/AH}$ * output | PF6 input | PF6 output |

Note: \*  $\overline{AH}$  output when MPXE = 1, and  $\overline{AS}$  output when MPXE = 0.

- PF5/ $\overline{RD}$

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, and bit PF5DDR.

|                |                        |  |           |            |                        |
|----------------|------------------------|--|-----------|------------|------------------------|
| Operating mode | 1, 2, 4                |  | 7         |            |                        |
| EXPE           | —                      |  | 0         |            | 1                      |
| PF5DDR         | —                      |  | 0         | 1          | —                      |
| Pin function   | $\overline{RD}$ output |  | PF5 input | PF5 output | $\overline{RD}$ output |

- PF4/ $\overline{HWR}$

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, and bit PF4DDR.

|                |                         |  |           |            |                         |
|----------------|-------------------------|--|-----------|------------|-------------------------|
| Operating mode | 1, 2, 4                 |  | 7         |            |                         |
| EXPE           | —                       |  | 0         |            | 1                       |
| PF4DDR         | —                       |  | 0         | 1          | —                       |
| Pin function   | $\overline{HWR}$ output |  | PF4 input | PF4 output | $\overline{HWR}$ output |

- PF3/ $\overline{\text{LWR}}$ /SSO0-C

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, bits MSS and BIDE in SSCRH, bit SSUMS in SSCRL, and bits TE and RE in SSER of the SSU, bit LWROE in PFCR2, bits SSOS1 and SSOS0 in PFCR5, and bit PF3DDR.

| Operating mode | 1, 2, 4, 7 (EXPE = 1)          |                    |            |                            |                             | 7 (EXPE = 0)       |            |                            |                             |
|----------------|--------------------------------|--------------------|------------|----------------------------|-----------------------------|--------------------|------------|----------------------------|-----------------------------|
|                | 1                              | 0                  |            |                            |                             | 0                  |            |                            |                             |
| SSU settings   | —                              | (1) in table below |            | (2) in table below         | (3) in table below          | (1) in table below |            | (2) in table below         | (3) in table below          |
| PF3DDR         | —                              | 0                  | 1          | 0                          | —                           | 0                  | 1          | 0                          | —                           |
| Pin function   | $\overline{\text{LWR}}$ output | PF3 input          | PF3 output | SSO0-C input* <sup>1</sup> | SSO0-C output* <sup>2</sup> | PF3 input          | PF3 output | SSO0-C input* <sup>1</sup> | SSO0-C output* <sup>2</sup> |

- Notes: 1. SSO0-C input when SSO0S1 and SSO0S0 = B'10 in PFCR5.  
 2. SSO0-C output when SSO0S1 and SSO0S0 = B'10 in PFCR5.

Notes: 1.  $\overline{IRQ14}$  input when the ITS14 bit in ITSr is 0.

2. SSCK0-C input when SSCK0S1 and SSCK0S0 = B'10 in PFCR5.

3. SSCK0-C output when SSCK0S1 and SSCK0S0 = B'10 in PFCR5.

4. Not supported in the H8S/2426 Group.

5. Not supported in the 5-V version.

[Legend]

- x: Don't care  
 —: Not used as the SSU pin (can be used as an I/O port).

## 10.15 Port G

Port G is a 7-bit I/O port that also has other functions. Port G has the following registers.

- Port G data direction register (PGDDR)
- Port G data register (PGDR)
- Port G register (PORTG)
- Port function control register 0 (PFCR0)
- Port function control register 4 (PFCR4)
- Port G open drain control register (PGODR)

### 10.15.1 Port G Data Direction Register (PGDDR)

The individual bits of PGDDR specify input or output for the pins of port G. PGDDR cannot be read; if it is, an undefined value will be read.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | —        | 0             | —   | Reserved  |
| 6   | PG6DDR   | 0             | W   | <ul style="list-style-type: none"> <li>Modes 7 (when EXPE = 1), 1, 2, and 4</li> </ul> Pins PG6 and PG5 function as bus control input/output pins (BREQ and BACK) when the appropriate bus controller settings are made. Otherwise, these pins are I/O ports, and their functions can be switched with PGDDR. |
| 5   | PG5DDR   | 0             | W   |   |
| 4   | PG4DDR   | 0             | W   |   |
| 3   | PG3DDR   | 0             | W   |   |
| 2   | PG2DDR   | 0             | W   |   |
| 1   | PG1DDR   | 0             | W   |   |
| 0   | PG0DDR   | 1/0*          | W   |   |

The PG4 pin function as a bus control input/output pin ( $\overline{\text{BREQO}}$ ) when the appropriate bus controller settings are made. Otherwise, operations differ between the H8S/2426 and H8S/2426R Groups and H8S/2424 Group.

[H8S/2426 Group and H8S/2426R Group]

The PG4 pin is a general I/O port and the function can be switched with PG4DDR.

[H8S/2424 Group]

When the  $\overline{\text{CS}}$  output enable bit (CS4E) is 1, the PG4 pin functions as a  $\overline{\text{CS}}$ 4 output pin when the PG4DDR is set to 1, and as an input port when the bit is cleared to 0. When the  $\overline{\text{CS}}$  output enable bit (CS4E) is 0, the PG4 pin is a general I/O port, and the function can be switched with PG4DDR.

When the  $\overline{\text{CS}}$  output enable bits (CS3E to CS0E) are set to 1, pins PG3 to PG0 function as  $\overline{\text{CS}}$  output pins when the corresponding PGDDR bit is set to 1, and as input ports when the bit is cleared to 0. When the  $\overline{\text{CS}}$  output enable bits (CS3E to CS0E) are cleared to 0, pins PG3 to PG0 are I/O ports, and their functions can be switched with PGDDR.

- Mode 7 (when EXPE = 0)

Pins PG6 to PG0 are I/O ports, and their functions can be switched with PGDDR.

Note: \* PG0DDR is initialized to 1 in modes 1 and 2, and to 0 in modes 4 and 7.

### 10.15.2 Port G Data Register (PGDR)

PGDR stores output data for the port G pins.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | —        | 0             | —   | Reserved<br>This bit is always read as 0, and cannot be modified.                            |
| 6   | PG6DR    | 0             | R/W | Output data for a pin is stored when the pin function is specified as a general purpose I/O. |
| 5   | PG5DR    | 0             | R/W |  |
| 4   | PG4DR    | 0             | R/W |  |
| 3   | PG3DR    | 0             | R/W |  |
| 2   | PG2DR    | 0             | R/W |  |
| 1   | PG1DR    | 0             | R/W |  |
| 0   | PG0DR    | 0             | R/W |  |

### 10.15.3 Port G Register (PORTG)

PORTG shows the pin states of port G. PORTG cannot be modified.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | —        | Undefined     | —   | Reserved<br>If this bit is read, it will return an undefined value.  |
| 6   | PG6      | —*            | R   | If this register is read while a PGDDR bit is set to 1, the corresponding PGDR value is read. If this register is read while a PGDDR bit is cleared to 0, the corresponding pin state is read. |
| 5   | PG5      | —*            | R   |  |
| 4   | PG4      | —*            | R   |  |
| 3   | PG3      | —*            | R   |  |
| 2   | PG2      | —*            | R   |  |
| 1   | PG1      | —*            | R   |  |
| 0   | PG0      | —*            | R   |  |

Note: \* Determined by the states of pins PG6 to PG0.

### 10.15.4 Port G Open Drain Control Register (PGODR)

PGODR specifies the output type of each port G pin.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | —        | 0             | —   | Reserved<br>This bit is always read as 0. Only the initial value should be written to this bit.  |
| 6   | PG6ODR   | 0             | R/W | When not specified for $\overline{\text{BACK-A}}$ , $\overline{\text{BREQO-A}}$ , $\overline{\text{CS0}}$ , $\overline{\text{CS1}}$ , $\overline{\text{CS2}}$ , $\overline{\text{CS3}}$ , $\overline{\text{CS4}}^{*2}$ , $\overline{\text{RAS2}}^{*3}$ , $\overline{\text{RAS3}}^{*3}$ , $\overline{\text{RAS}}^{*1}$ , or $\overline{\text{CAS}}^{*1}$ output, setting a PGODR bit to 1 makes the corresponding pin an NMOS open-drain output pin, while clearing a PGODR bit to 0 makes the corresponding pin a CMOS output pin. |
| 5   | PG5ODR   | 0             | R/W |  |
| 4   | PG4ODR   | 0             | R/W |  |
| 3   | PG3ODR   | 0             | R/W |  |
| 2   | PG2ODR   | 0             | R/W |  |
| 1   | PG1ODR   | 0             | R/W |  |
| 0   | PG0ODR   | 0             | R/W |  |

- Notes:
1. Not supported in the H8S/2426 and 2424 Groups.
  2. Not supported in the H8S/2426 and 2426R Groups.
  3. Not supported in the 5-V version.

### 10.15.5 Pin Functions

Port G pins also function as the pins for bus control signal I/Os. The correspondence between the register specification and the pin functions is shown below.

- $\overline{\text{PG6/BREQ-A}}$

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, bit BRLE in BCR of the bus controller, bit BREQS in PFCR4, and bit PG6DDR.

|                |  |            |                                  |           |            |  |            |                                  |
|----------------|--|------------|----------------------------------|-----------|------------|--|------------|----------------------------------|

## 10.16 Port H

Note: Port H is not supported in the H8S/2424 Group.

Port H is a 4-bit I/O port that also has other functions. Port H has the following registers. For the port function control registers, refer to section 10.18, Port Function Control Registers.

- Port H data direction register (PHDDR)
- Port H data register (PHDR)
- Port H register (PORTH)
- Port function control register 0 (PFCR0)
- Port function control register 2 (PFCR2)
- Port H open drain control register (PHODR)

### 10.16.1 Port H Data Direction Register (PHDDR)

The individual bits of PHDDR specify input or output for the pins of port H. PHDDR cannot be read; if it is, an undefined value will be read.

| Bit    | Bit Name | Initial Value | R/W | Description  |
|--------|----------|---------------|-----|--|
| 7 to 4 | —        | All 0         | —   | Reserved   |
| 3      | PH3DDR   | 0             | W   | • Modes 7 (when EXPE = 1), 1, 2, and 4   |
| 2      | PH2DDR   | 0             | W   | Pin PH3 functions as the $\overline{OE}$ output pin when the $\overline{OE}$ output enable bit (OEE) and $\overline{OE}$ output select bit (OES) are set to 1. Otherwise, pin PH3 functions as the $\overline{CS7}$ output pin when bit PH3DDR is set to 1 while bit CS7E is 1, and as an input port when the bit is cleared to 0. When bit CS7E is cleared to 0, pin PH3 is an I/O port, and its function can be switched with bit PH3DDR. When areas 2 to 5 are specified as continuous SDRAM* <sup>1</sup> space, $\overline{OE}$ output is CKE output. |
| 1      | PH1DDR   | 0             | W   |  |
| 0      | PH0DDR   | 0             | W   |  |
|        |          |               |     | Pin PH2 function as the $\overline{CS6}$ output pin when bit PH2DDR is set to 1 while bit CS6E is 1, and as an I/O port when the bit is cleared to 0. When bit CS6E is cleared to 0, pin PH2 is an I/O port, and its function can be switched with bit PH2DDR.   |

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 0   | PH0DDR   | 0             | W   | <p>Pin PH1 functions as the <math>\overline{\text{SDRAM}}\phi^{*1}</math> output pin when the SDPSTP bit is 0 in the H8S/2426R Group. In the H8S/2426 Group or when the SDPSTP bit is 1 in the H8S/2426R Group, if bit CS5E is set to 1 while area 5 is specified as normal space, pin PH1 functions as the <math>\overline{\text{CS}}5</math> output pin when bit PH1DDR is set to 1, and functions as an I/O port when the bit is cleared to 0. When bit CS5E is cleared to 0, pin PH1 is an I/O port, and its function can be switched with bit PH1DDR. When area 5 is specified as DRAM space<sup>*2</sup> and bit <math>\overline{\text{CS}}5\text{E}</math> is set to 1, pin PH1 functions as the <math>\overline{\text{RAS}}5^{*2}</math> output pin and as an I/O port when the bit is cleared to 0.</p> <p>Pin PH0 functions as the <math>\overline{\text{CS}}4</math> output pin when area 4 is specified as normal space and bit PH0DDR is set to 1. If bit PH0DDR is cleared to 0, pin PH0 functions as an I/O port. When bit CS4E is cleared to 0, pin PH0 is an I/O port, and its function can be switched with bit PH0DDR. When area 4 is specified as DRAM space<sup>*2</sup> and bit CS4E is set to 1, pin PH0 functions as the <math>\overline{\text{RAS}}4^{*2}</math> output pin and as an I/O port when the bit is cleared to 0. When areas 2 to 5 are specified as continuous SDRAM space<sup>*1</sup>, pin PH0 functions as the <math>\overline{\text{WE}}</math> output pin when bit CS4E is set to 1, and as an I/O port when the bit is cleared to 0.</p> <ul style="list-style-type: none"> <li>• Mode 7 (when EXPE = 0)</li> </ul> <p>Pins PH3, PH2, and PH0 are I/O ports, and their functions can be switched with PHDDR.</p> <p>Pin PH1 functions as the <math>\overline{\text{SDRAM}}\phi^{*1}</math> output pin when the SDPSTP bit is 0 in the H8S/2426R Group. In the H8S/2426 Group or when the SDPSTP bit is 1 in the H8S/2426R Group, pin PH1 is an I/O port and its function can be switched with PHDDR.</p> |

Notes: 1. Not supported in the H8S/2426 Group.  
 2. Not supported in the 5-V version.

### 10.16.2 Port H Data Register (PHDR)

PHDR stores output data for the port H pins.

| Bit    | Bit Name | Initial Value | R/W | Description  |
|--------|----------|---------------|-----|--|
| 7 to 4 | —        | All 0         | —   | Reserved<br>These bits are always read as 0 and cannot be modified.                          |
| 3      | PH3DR    | 0             | R/W | Output data for a pin is stored when the pin function is specified as a general purpose I/O. |
| 2      | PH2DR    | 0             | R/W |  |
| 1      | PH1DR    | 0             | R/W |  |
| 0      | PH0DR    | 0             | R/W |  |

### 10.16.3 Port H Register (PORTH)

PORTH shows the pin states of port H. PORTH cannot be modified.

| Bit    | Bit Name | Initial Value | R/W | Description  |
|--------|----------|---------------|-----|--|
| 7 to 4 | —        | Undefined     | —   | Reserved<br>If these bits are read, they will return an undefined value.   |
| 3      | PH3      | —*            | R   | If this register is read while a PHDDR bit is set to 1, the corresponding PHDR value is read. If this register is read while a PHDDR bit is cleared to 0, the corresponding pin state is read. |
| 2      | PH2      | —*            | R   |  |
| 1      | PH1      | —*            | R   |  |
| 0      | PH0      | —*            | R   |  |

Note: \* Determined by the states of pins PH3 to PH0.

### 10.16.4 Port H Open Drain Control Register (PHODR)

PHODR specifies the output type of each port H pin.

| Bit    | Bit Name | Initial Value | R/W | Description  |
|--------|----------|---------------|-----|--|
| 7 to 4 | —        | All 0         | —   | Reserved<br>These bits are always read as 0. Only the initial values should be written to these bits.  |
| 3      | PH3ODR   | 0             | R/W | When not specified for $\overline{CS4}$ , $\overline{CS5}$ , $\overline{CS6}$ , $\overline{CS7}$ , $\overline{OE-A}^{*2}$ , $\overline{CKE-A}^{*1}$ , $\overline{RAS4}^{*2}$ , $\overline{RAS5}^{*2}$ , $\overline{WE}^{*1}$ , or $\overline{SDRAM\phi}^{*1}$ output, setting a PHODR bit to 1 makes the corresponding pin an NMOS open-drain output pin, while clearing a PHODR bit to 0 makes the corresponding pin a CMOS output pin. |
| 2      | PH2ODR   | 0             | R/W |  |
| 1      | PH1ODR   | 0             | R/W |  |
| 0      | PH0ODR   | 0             | R/W |  |

- Notes:
1. Not supported in the H8S/2426 Group.
  2. Not supported in the 5-V version.

## 10.16.5 Pin Functions

Port H pins also function as bus control signal I/Os and interrupt inputs. The correspondence between the register specification and the pin functions is shown below.

- $\overline{\text{PH3}}/\overline{\text{CS7}}/\overline{\text{OE-A}}^{*3}/\text{CKE-A}^{*2}/\overline{\text{IRQ7-B}}$

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, bit OEE in DRAMCR of the bus controller, bit OES in PFCR2, bit CS7E in PFCR0, and bit PH3DDR.

- Modes 1, 2, 4, and 7 (EXPE = 1)

|                |  |            |           |                                |           |            |           |                                |                                      |   |
|----------------|--|------------|-----------|--------------------------------|-----------|------------|-----------|--------------------------------|--------------------------------------|---|
| OEE            | 0  |            |           |                                | 1         |            |           |                                |                                      |   |
| OES            | 0  |            |           |                                | 0         |            |           |                                | 1                                    |   |
| RMTS2 to RMTS0 | —  |            |           |                                | —         |            |           |                                | Any of areas 2 to 5 are DRAM space   | Areas 2 to 5 are synchronous DRAM space |
| CS7E           | 0  |            | 1         |                                | 0         |            | 1         |                                | —                                    | —                                       |
| PH3DDR         | 0  | 1          | 0         | 1                              | 0         | 1          | 0         | 1                              | —                                    | —                                       |
| Pin function   | PH3 input                                      | PH3 output | PH3 input | $\overline{\text{CS7}}$ output | PH3 input | PH3 output | PH3 input | $\overline{\text{CS7}}$ output | $\overline{\text{OE-A}}^{*3}$ output | $\text{CKE-A}^{*2}$ output              |
|                | $\overline{\text{IRQ7-B}}$ input* <sup>1</sup> |            |           |                                |           |            |           |                                |                                      |   |

- Mode 7 (EXPE = 0)

|                |                            |            |
|----------------|----------------------------|------------|
| OEE            | —                          |            |
| OES            | —                          |            |
| RMTS2 to RMTS0 | —                          |            |
| CS7E           | —                          |            |
| PH3DDR         | 0                          | 1          |
| Pin function   | PH3 input                  | PH3 output |
|                | IRQ7-B input* <sup>1</sup> |            |

Notes: 1. IRQ7-B input when the ITS7 bit in ITSR is 1.

2. Not supported in the H8S/2426 Group.

3. Not supported in the 5-V version.

- PH2/ $\overline{\text{CS6}}$ /IRQ6-B

The pin function is switched as shown below according to the combination of the operating mode, bit CS6E in PFCR0, and bit PH2DDR.

|                |                         |            |           |                                |           |            |           |            |           |                                |
|----------------|-------------------------|------------|-----------|--------------------------------|-----------|------------|-----------|------------|-----------|--------------------------------|
| Operating mode | 1, 2, 4                 |            |           |                                | 7         |            |           |            |           |                                |
| EXPE           | —                       |            |           |                                | 0         |            | 1         |            |           |                                |
| CS6E           | 0                       |            | 1         |                                | —         |            | 0         |            | 1         |                                |
| PH2DDR         | 0                       | 1          | 0         | 1                              | 0         | 1          | 0         | 1          | 0         | 1                              |
| Pin function   | PH2 input               | PH2 output | PH2 input | $\overline{\text{CS6}}$ output | PH2 input | PH2 output | PH2 input | PH2 output | PH2 input | $\overline{\text{CS6}}$ output |
|                | IRQ6-B interrupt input* |            |           |                                |           |            |           |            |           |                                |

Note: \* IRQ6-B input when the ITS6 bit in ITSR is 1.

- PH1/ $\overline{\text{CS5}}$ / $\overline{\text{RAS5}}^{*2}$ /SDRAM $\phi^{*1}$

The pin function is switched as shown below according to the combination of the operating mode, bit EXPE, bits RMTS2 to RMTS0 in DRAMCR of the bus controller, bit SDPSTP in SCKCR of the clock pulse generator, bit CS5E in PFCR0 and bit PH1DDR.

|                |                        |            |           |                                |                      |            |                                      |           |            |           |            |           |                        |                                |           |            |                                      |                             |   |  |   |  |  |  |   |
|----------------|------------------------|------------|-----------|--------------------------------|----------------------|------------|--------------------------------------|-----------|------------|-----------|------------|-----------|------------------------|--------------------------------|-----------|------------|--------------------------------------|-----------------------------|---|--|---|--|--|--|---|
| SDPSTP         | 1                      |            |           |                                |                      |            |                                      |           |            |           |            |           |                        |                                |           |            | 0                                    |                             |   |  |   |  |  |  |   |

- Notes: 1. Not supported in the H8S/2426 Group.  
 2. Not supported in the 5-V version.

## 10.17 Port J

Note: Port J is not supported in the H8S/2424 Group and in the 145-pin package.

Port J is a 3-bit I/O port. Port J has the following registers.

- Port J data direction register (PJDDR)
- Port J data register (PJDR)
- Port J register (PORT3)
- Port J open drain control register (PJODR)

### 10.17.1 Port J Data Direction Register (PJDDR)

The individual bits of PJDDR specify input or output for the pins of port J. PJDDR cannot be read; if it is, an undefined value will be read.

| Bit    | Bit Name | Initial Value | R/W | Description  |
|--------|----------|---------------|-----|--|
| 7 to 2 | —        | All 0         | —   | Reserved   |
| 1      | PJ1DDR   | 0             | W   | When a pin function is specified as a general purpose I/O, setting this bit to 1 makes the corresponding pin an output port, while clearing this bit to 0 makes the corresponding pin an input port. |
| 0      | PJ0DDR   | 0             | W   |  |

### 10.17.2 Port J Data Register (PJDR)

PJDR stores output data for the port J pins.

| Bit    | Bit Name | Initial Value | R/W | Description  |
|--------|----------|---------------|-----|--|
| 7 to 2 | —        | All 0         | —   | Reserved<br>These bits are always read as 0 and cannot be modified.                          |
| 1      | PJ1DR    | 0             | R/W | Output data for a pin is stored when the pin function is specified as a general purpose I/O. |
| 0      | PJ0DR    | 0             | R/W |  |

### 10.17.3 Port J Register (PORTJ)

PORTJ shows the pin states of port J. PORTJ cannot be modified.

| Bit    | Bit Name | Initial Value | R/W | Description   |
|--------|----------|---------------|-----|---|
| 7 to 3 | —        | Undefined     | —   | Reserved<br>If these bits are read, they will return an undefined value.                                    |
| 2      | PJ2      | —*            | R   | The pin state is always read from this register.  |
| 1      | PJ1      | —*            | R   | If this register is read, the PJDR values are read for the bits with the corresponding PJDDR bits set to 1. |
| 0      | PJ0      | —*            | R   | For the bits with the corresponding PJDDR bits cleared to 0, the pin states are read.                       |

Note: \* Determined by the state of pins PJ0 to PJ2.

### 10.17.4 Port J Open Drain Control Register (PJODR)

PJODR specifies the output type of each port J pin.

| Bit    | Bit Name | Initial Value | R/W | Description  |
|--------|----------|---------------|-----|--|
| 7 to 2 | —        | All 0         | —   | Reserved<br>These bits are always read as 0. Only the initial values should be written to these bits.  |
| 1      | PJ1ODR   | 0             | R/W | Setting a PJODR bit to 1 makes the corresponding pin an NMOS open-drain output pin, while clearing a PJODR bit to 0 makes the corresponding pin a CMOS output pin. |
| 0      | PJ0ODR   | 0             | R/W |  |

### 10.17.5 Pin Functions

Port J pins function only as I/O ports. The correspondence between the register specification and the pin functions is shown below.

- PJ2

The PJ2 pin is an input-only pin.

|              |           |
|--------------|-----------|
| Pin function | PJ2 input |
|--------------|-----------|

- PJ1, PJ0

The pin function is switched as shown below according to bit PJnDDR.

|              |           |            |
|--------------|-----------|------------|
| PJnDDR       | 0         | 1          |
| Pin function | PJn input | PJn output |

[Legend]

n = 1 or 0

## 10.18 Port Function Control Registers

The port function controller performs I/O port control. The setting of input or output for each pin should be enabled only after the input or output destination has been selected.

The port function controller has the following registers.

- Port function control register 0 (PFCR0)
- Port function control register 1 (PFCR1)
- Port function control register 2 (PFCR2)
- Port function control register 3 (PFCR3)
- Port function control register 4 (PFCR4)
- Port function control register 5 (PFCR5)

### 10.18.1 Port Function Control Register 0 (PFCR0)

PFCR0 switches the functions of the chip select output pins.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | CS7E     | 1             | R/W | CS7 to CS0 Enable  |
| 6   | CS6E     | 1             | R/W | These bits enable or disable the corresponding CS <sub>n</sub> output. |
| 5   | CS5E     | 1             | R/W |  |
| 4   | CS4E     | 1             | R/W | 0: Pin is designated as I/O port                                       |
| 3   | CS3E     | 1             | R/W | 1: Pin is designated as $\overline{\text{CS}}_n$ output pin            |
| 2   | CS2E     | 1             | R/W | (n = 7 to 0)   |
| 1   | CS1E     | 1             | R/W |  |
| 0   | CS0E     | 1             | R/W |  |

## 10.18.2 Port Function Control Register 1 (PFCR1)

PFCR1 enables or disables address output (A23 to A16).

Bits 7 to 5 are valid in modes 1 and 2 and all the bits are valid in modes 4 and 7.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | A23E     | 1             | R/W | Address 23 Enable<br>Enables or disables output for address output 23 (A23).<br>0: DR output when PA7DDR = 1<br>1: A23 output when PA7DDR = 1 |
| 6   | A22E     | 1             | R/W | Address 22 Enable<br>Enables or disables output for address output 22 (A22).<br>0: DR output when PA6DDR = 1<br>1: A22 output when PA6DDR = 1 |
| 5   | A21E     | 1             | R/W | Address 21 Enable<br>Enables or disables output for address output 21 (A21).<br>0: DR output when PA5DDR = 1<br>1: A21 output when PA5DDR = 1 |
| 4   | A20E     | 1             | R/W | Address 20 Enable<br>Enables or disables output for address output 20 (A20).<br>0: DR output when PA4DDR = 1<br>1: A20 output when PA4DDR = 1 |
| 3   | A19E     | 1             | R/W | Address 19 Enable<br>Enables or disables output for address output 19 (A19).<br>0: DR output when PA3DDR = 1<br>1: A19 output when PA3DDR = 1 |
| 2   | A18E     | 1             | R/W | Address 18 Enable<br>Enables or disables output for address output 18 (A18).<br>0: DR output when PA2DDR = 1<br>1: A18 output when PA2DDR = 1 |

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 1   | A17E     | 1             | R/W | Address 17 Enable<br>Enables or disables output for address output 17 (A17).<br>0: DR output when PA1DDR = 1<br>1: A17 output when PA1DDR = 1 |

### 10.18.3 Port Function Control Register 2 (PFCR2)

PFCR2 enables or disables  $\overline{AS}$  output,  $\overline{LWR}$  output, and  $\overline{OE}$  output.

| Bit    | Bit Name | Initial Value | R/W | Description  |
|--------|----------|---------------|-----|--|
| 7 to 4 | —        | All 0         | —   | Reserved<br>These bits are always read as 0 and cannot be modified.  |
| 3      | ASOE     | 1             | R/W | $\overline{AS}$ Output Enable<br>Enables or disables the $\overline{AS}$ output pin.<br>0: PF6 is designated as I/O port<br>1: PF6 is designated as $\overline{AS}$ output pin   |
| 2      | LWROE    | 1             | R/W | $\overline{LWR}$ Output Enable<br>Enables or disables the $\overline{LWR}$ output pin.<br>0: PF3 is designated as I/O port<br>1: PF3 is designated as $\overline{LWR}$ output pin  |
| 1      | OES      | 1             | R/W | $\overline{OE}$ Output Select<br>Selects the $\overline{OE}^{*2}/\text{CKE}^{*1}$ output pin port when the OEE bit in DRAMCR is set to 1 (enabling $\overline{OE}^{*2}/\text{CKE}^{*1}$ output).<br>0: P35 is designated as $\overline{OE-B}^{*2}/\text{CKE-B}^{*1}$ output pin.<br>1: [H8S/2426 Group, H8S/2426R Group]<br>PH3 is designated as $\overline{OE-A}^{*2}/\text{CKE-A}^{*1}$ output pin.<br>[H8S/2424 Group]<br>PF0 is designated as $\overline{OE-A}^{*2}$ output pin. |
| 0      | —        | 0             | —   | Reserved<br>This bit is always read as 0. Only the initial value should be written to this bit.  |

- Notes: 1. Not supported in the H8S/2426 and H8S/2424 Groups.  
2. Not supported in the 5-V version.

### 10.18.4 Port Function Control Register 3 (PFCR3)

PFCR3 switches the functions of the PPG output pin, TPU input/output pin, and TMR input/output pin.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | —        | 1             | —   | Reserved<br>This bit is always read as 1. Only the initial value should be written to this bit.  |
| 6   | PPGS     | 0             | R/W | PPG Pin Select<br>Selects the output pins of PO5 to PO0.<br>0: P25/PO5-A, P24/PO4-A, P23/PO3-A, P22/PO2-A, P21/PO1-A, and P20/PO0-A are selected<br>1: P85/PO5-B, P52/PO4-B, P83/PO3-B, P51/PO2-B, P81/PO1-B, and P50/PO0-B are selected   |
| 5   | TPUS     | 0             | R/W | TPU Pin Select<br>Selects the output pins of TIOCA3, TIOCB3, TIOCC3, TIOCD3, TIOCA4, and TIOCB4.<br>0: P25/TIOCB4-A, P24/TIOCA4-A, P23/TIOCD3-A, P22/TIOCC3-A, P21/TIOCB3-A, and P20/TIOCA3-A are selected<br>1: P85/TIOCB4-B, P52/TIOCA4-B, P83/TIOCD3-B, P51/TIOCC3-B, P81/TIOCB3-B, and P50/TIOCA3-B are selected |

| Bit    | Bit Name | Initial Value | R/W | Description   |
|--------|----------|---------------|-----|---|
| 4      | TMRS     | 0             | R/W | <p>TMR Pin Select</p> <p>Selects the output pins of TMO1 and TMO0 and input pins of TMC11, TMC10, TMRI1, and TMRI0.</p> <p>0: [H8S/2426 Group, H8S/2426R Group]<br/>P65/TMO1-A, P64/TMO0-A, P63/TMC11-A, P62/TMC10-A, P61/TMRI1-A, and P60/TMRI0-A are selected</p> <p>[H8S/2424 Group]<br/>P25/TMO1-A, P24/TMO0-A, P23/TMC11-A, P22/TMC10-A, P21/TMRI1-A, and P20/TMRI0-A are selected</p> <p>1: P85/TMO1-B, P52/TMO0-B, P83/TMC11-B, P51/TMC10-B, P81/TMRI1-B, and P50/TMRI0-B are selected</p> |
| 3 to 1 | —        | All 0         | —   | <p>Reserved</p> <p>These bits are always read as 0. Only the initial values should be written to these bits.</p>  |
| 0      | —        | 1             | —   | <p>Reserved</p> <p>This bit is always read as 1. Only the initial value should be written to this bit.</p>  |

### 10.18.5 Port Function Control Register 4 (PFCR4)

PFCR4 switches the functions of the  $\overline{\text{WAIT}}$  input pin,  $\overline{\text{BREQ}}$  input pin,  $\overline{\text{BACK}}$  output pin,  $\overline{\text{BREQO}}$  output pin, TxD4 output pin, RxD4 input pin, and SCK4 input/output pin.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | WAITS    | 0             | R/W | <p><math>\overline{\text{WAIT}}</math> Pin Select</p> <p>Selects the <math>\overline{\text{WAIT}}</math> input pin.</p> <p>0: PF0/<math>\overline{\text{WAIT-A}}</math> is selected</p> <p>1: P25/<math>\overline{\text{WAIT-B}}</math> is selected</p> |
| 6   | BREQS    | 0             | R/W | <p><math>\overline{\text{BREQ}}</math> Pin Select</p> <p>Selects the <math>\overline{\text{BREQ}}</math> input pin.</p> <p>0: PG6/<math>\overline{\text{BREQ-A}}</math> is selected</p> <p>1: P51/<math>\overline{\text{BREQ-B}}</math> is selected</p> |

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 5   | BACKS    | 0             | R/W | <p><math>\overline{\text{BACK}}</math> Pin Select</p> <p>Selects the <math>\overline{\text{BACK}}</math> output pin.</p> <p>0: PG5/<math>\overline{\text{BACK-A}}</math> is selected</p> <p>1: P52/<math>\overline{\text{BACK-B}}</math> is selected</p>     |

| 1   | SCS0S1   | 0             | R/W | SCS0 Pin Select   |
| 0   | SCS0S0   | 0             | R/W | Selects the $\overline{\text{SCS0}}$ input/output pin.<br>00: P17/ $\overline{\text{SCS0-A}}$ is selected<br>01: PA4/ $\overline{\text{SCS0-B}}$ is selected<br>10: PF0/ $\overline{\text{SCS0-C}}$ is selected<br>11: Setting prohibited |

## Section 11 16-Bit Timer Pulse Unit (TPU)

This LSI has two on-chip 16-bit timer pulse units (TPU: unit 0 and unit 1) which each comprises six 16-bit timer channels, resulting in a total of 12 channels. The functions of unit 0 are listed in table 11.1, and the functions of unit 1 are listed in table 11.2. The block diagram of unit 0 is shown in figure 11.1 and the block diagram of unit 1 is shown in figure 11.2.

The descriptions in this section refer to unit 0.

### 11.1 Features

- Maximum 32-pulse input/output (unit 0: 16, unit 1: 16, when the EXPE bit is 0 in single-chip mode)
- Selection of 8 counter input clocks for each channel
- The following operations can be set for each channel:
  - Waveform output at compare match
  - Input capture function
  - Counter clear operation
  - Synchronous operations:
    - Multiple timer counters (TCNT) can be written to simultaneously.
    - Simultaneous clearing by compare match and input capture possible
    - Register simultaneous input/output possible by counter synchronous operation
  - Maximum of 15-phase PWM output possible by combination with synchronous operation
- Buffer operation settable for channels 0 (6) and 3 (9)
- Phase counting mode settable independently for each of channels 1 (7), 2 (8), 4 (10), and 5 (11)
- Cascaded operation
- Fast access via internal 16-bit bus
- 26 interrupt sources (per unit)
- Automatic transfer of register data
- Programmable pulse generator (PPG) output trigger can be generated (only by unit 0).
- A/D converter conversion start trigger can be generated.
- Module stop state can be set.
- Activation of the DMAC (only by unit 0) and DTC

**Table 11.1 TPU (Unit 0) Functions**

| Item                                   | Channel 0                          | Channel 1                          | Channel 2                          | Channel 3                          | Channel 4                          | Channel 5                          |

Note: \* The output functions of unit 1 are only available when EXPE = 0 in single-chip mode.

## 11.3 Register Descriptions

The TPU has the following registers in each channel. The descriptions in this section refer to the registers of unit 0.

### Unit 0:

#### Channel 0

- Timer control register\_0 (TCR\_0)
- Timer mode register\_0 (TMDR\_0)
- Timer I/O control register H\_0 (TIORH\_0)
- Timer I/O control register L\_0 (TIORL\_0)
- Timer interrupt enable register\_0 (TIER\_0)
- Timer status register\_0 (TSR\_0)
- Timer counter\_0 (TCNT\_0)
- Timer general register A\_0 (TGRA\_0)
- Timer general register B\_0 (TGRB\_0)
- Timer general register C\_0 (TGRC\_0)
- Timer general register D\_0 (TGRD\_0)

#### Channel 1

- Timer control register\_1 (TCR\_1)
- Timer mode register\_1 (TMDR\_1)
- Timer I/O control register\_1 (TIOR\_1)
- Timer interrupt enable register\_1 (TIER\_1)
- Timer status register\_1 (TSR\_1)
- Timer counter\_1 (TCNT\_1)
- Timer general register A\_1 (TGRA\_1)
- Timer general register B\_1 (TGRB\_1)

## Channel 2

- Timer control register\_2 (TCR\_2)
- Timer mode register\_2 (TMDR\_2)
- Timer I/O control register\_2 (TIOR\_2)
- Timer interrupt enable register\_2 (TIER\_2)
- Timer status register\_2 (TSR\_2)
- Timer counter\_2 (TCNT\_2)
- Timer general register A\_2 (TGRA\_2)
- Timer general register B\_2 (TGRB\_2)

## Channel 3

- Timer control register\_3 (TCR\_3)
- Timer mode register\_3 (TMDR\_3)
- Timer I/O control register H\_3 (TIORH\_3)
- Timer I/O control register L\_3 (TIORL\_3)
- Timer interrupt enable register\_3 (TIER\_3)
- Timer status register\_3 (TSR\_3)
- Timer counter\_3 (TCNT\_3)
- Timer general register A\_3 (TGRA\_3)
- Timer general register B\_3 (TGRB\_3)
- Timer general register C\_3 (TGRC\_3)
- Timer general register D\_3 (TGRD\_3)

## Channel 4

- Timer control register\_4 (TCR\_4)
- Timer mode register\_4 (TMDR\_4)
- Timer I/O control register\_4 (TIOR\_4)
- Timer interrupt enable register\_4 (TIER\_4)
- Timer status register\_4 (TSR\_4)
- Timer counter\_4 (TCNT\_4)
- Timer general register A\_4 (TGRA\_4)
- Timer general register B\_4 (TGRB\_4)

## Channel 5

- Timer control register\_5 (TCR\_5)
- Timer mode register\_5 (TMDR\_5)
- Timer I/O control register\_5 (TIOR\_5)
- Timer interrupt enable register\_5 (TIER\_5)
- Timer status register\_5 (TSR\_5)
- Timer counter\_5 (TCNT\_5)
- Timer general register A\_5 (TGRA\_5)
- Timer general register B\_5 (TGRB\_5)

## Common Registers of Unit 0

- Timer start register (TSTR)
- Timer synchronous register (TSYR)

## Unit 1:

## Channel 6

- Timer control register\_6 (TCR\_6)
- Timer mode register\_6 (TMDR\_6)
- Timer I/O control register H\_6 (TIORH\_6)
- Timer I/O control register L\_6 (TIORL\_6)
- Timer interrupt enable register\_6 (TIER\_6)
- Timer status register\_6 (TSR\_6)
- Timer counter\_6 (TCNT\_6)
- Timer general register A\_6 (TGRA\_6)
- Timer general register B\_6 (TGRB\_6)
- Timer general register C\_6 (TGRC\_6)
- Timer general register D\_6 (TGRD\_6)

## Channel 7

- Timer control register\_7 (TCR\_7)
- Timer mode register\_7 (TMDR\_7)
- Timer I/O control register\_7 (TIOR\_7)
- Timer interrupt enable register\_7 (TIER\_7)
- Timer status register\_7 (TSR\_7)
- Timer counter\_7 (TCNT\_7)
- Timer general register A\_7 (TGRA\_7)
- Timer general register B\_7 (TGRB\_7)

## Channel 8

- Timer control register\_8 (TCR\_8)
- Timer mode register\_8 (TMDR\_8)
- Timer I/O control register\_8 (TIOR\_8)
- Timer interrupt enable register\_8 (TIER\_8)
- Timer status register\_8 (TSR\_8)
- Timer counter\_8 (TCNT\_8)
- Timer general register A\_8 (TGRA\_8)
- Timer general register B\_8 (TGRB\_8)

## Channel 9

- Timer control register\_9 (TCR\_9)
- Timer mode register\_9 (TMDR\_9)
- Timer I/O control register H\_9 (TIORH\_9)
- Timer I/O control register L\_9 (TIORL\_9)
- Timer interrupt enable register\_9 (TIER\_9)
- Timer status register\_9 (TSR\_9)
- Timer counter\_9 (TCNT\_9)
- Timer general register A\_9 (TGRA\_9)
- Timer general register B\_9 (TGRB\_9)
- Timer general register C\_9 (TGRC\_9)
- Timer general register D\_9 (TGRD\_9)

## Channel 10

- Timer control register\_10 (TCR\_10)
- Timer mode register\_10 (TMDR\_10)
- Timer I/O control register\_10 (TIOR\_10)
- Timer interrupt enable register\_10 (TIER\_10)
- Timer status register\_10 (TSR\_10)
- Timer counter\_10 (TCNT\_10)
- Timer general register A\_10 (TGRA\_10)
- Timer general register B\_10 (TGRB\_10)

## Channel 11

- Timer control register\_11 (TCR\_11)
- Timer mode register\_11 (TMDR\_11)
- Timer I/O control register\_11 (TIOR\_11)
- Timer interrupt enable register\_11 (TIER\_11)
- Timer status register\_11 (TSR\_11)
- Timer counter\_11 (TCNT\_11)
- Timer general register A\_11 (TGRA\_11)
- Timer general register B\_11 (TGRB\_11)

## Common Registers of Unit 1

- Timer start register B (TSTRB)
- Timer synchronous register B (TSYRB)

### 11.3.1 Timer Control Register (TCR)

The TCR registers control the TCNT operation for each channel. The TPU has a total of six TCR registers, one for each channel. TCR register settings should be made only when TCNT operation is stopped.

| Bit | Bit Name | Initial Value | R/W | Description   |  |
|-----|----------|---------------|-----|---|--|
| 7   | CCLR2    | 0             | R/W | Counter Clear 2 to 0  |  |
| 6   | CCLR1    | 0             | R/W | These bits select the TCNT counter clearing source. See tables 11.4 and 11.5 for details.   |  |
| 5   | CCLR0    | 0             | R/W |   |  |
| 4   | CKEG1    | 0             | R/W | Clock Edge 1 and 0  |  |
| 3   | CKEG0    | 0             | R/W | These bits select the input clock edge. When the input clock is counted using both edges, the input clock period is halved (e.g. $\phi/4$ both edges = $\phi/2$ rising edge). If phase counting mode is used on channels 1, 2, 4, and 5, this setting is ignored and the phase counting mode setting has priority. Internal clock edge selection is valid when the input clock is $\phi/4$ or slower. This setting is ignored if the input clock is $\phi/1$ , or when overflow/underflow of another channel is selected.<br>00: Count at rising edge<br>01: Count at falling edge<br>1x: Count at both edges |  |
| 2   | TPSC2    | 0             | R/W |   | Time Prescaler 2 to 0  |
| 1   | TPSC1    | 0             | R/W |   | These bits select the TCNT counter clock. The clock source can be selected independently for each channel. See tables 11.6 to 11.11 for details. |
| 0   | TPSC0    | 0             | R/W |   |  |

[Legend]

x: Don't care

**Table 11.4 CCLR2 to CCLR0 (Channels 0 and 3)**

| Channel | Bit 7<br>CCLR2 | Bit 6<br>CCLR1 | Bit 5<br>CCLR0   | Description  |
|---------|----------------|----------------|--|--|
| 0, 3    | 0              | 0              | 0  | TCNT clearing disabled   |
|         |                |                | 1  | TCNT cleared by TGRA compare match/input capture   |
|         |                |                | 1  | TCNT cleared by counter clearing for another channel performing synchronous clearing/synchronous operation* <sup>1</sup> |
|         | 1              | 0              | 0  | TCNT clearing disabled   |
|         |                |                | 1  | TCNT cleared by TGRC compare match/input capture* <sup>2</sup>   |
|         |                |                | 1  | TCNT cleared by TGRD compare match/input capture* <sup>2</sup>   |
| 1       | 1              | 0              | TCNT clearing disabled   |  |
|         |                | 1              | TCNT cleared by TGRC compare match/input capture* <sup>2</sup>   |  |
|         |                | 1              | TCNT cleared by counter clearing for another channel performing synchronous clearing/synchronous operation* <sup>1</sup> |  |

Notes: 1. Synchronous operation setting is performed by setting the SYNC bit in TSYR to 1.  
 2. When TGRC or TGRD is used as a buffer register, TCNT is not cleared because the buffer register setting has priority, and compare match/input capture does not occur.

**Table 11.5 CCLR2 to CCLR0 (Channels 1, 2, 4, and 5)**

| Channel    | Bit 7<br>Reserved* <sup>2</sup> | Bit 6<br>CCLR1 | Bit 5<br>CCLR0 | Description                                      |  |
|------------|---------------------------------|----------------|----------------|--|--|
| 1, 2, 4, 5 | 0                               | 0              | 0              | TCNT clearing disabled                           |  |

|            |                                 | 1              | 1              | 0  | TCNT clearing disabled   |
|            |                                 |                |                | 1  | TCNT cleared by TGRC compare match/input capture* <sup>2</sup>   |
|            |                                 |                |                | 1  | TCNT cleared by counter clearing for another channel performing synchronous clearing/synchronous operation* <sup>1</sup> |

Notes: 1. Synchronous operation setting is performed by setting the SYNC bit in TSYR to 1.  
 2. Bit 7 is reserved in channels 1, 2, 4, and 5. It is always read as 0 and cannot be modified.

**Table 11.6 TPSC2 to TPSC0 (Channel 0)**

| Channel | Bit 2<br>TPSC2 | Bit 1<br>TPSC1 | Bit 0<br>TPSC0 | Description                               |
|---------|----------------|----------------|----------------|---|
| 0       | 0              | 0              | 0              | Internal clock: counts on $\phi/1$        |
|         |                |                | 1              | Internal clock: counts on $\phi/4$        |
|         |                | 1              | 0              | Internal clock: counts on $\phi/16$       |
|         |                |                | 1              | Internal clock: counts on $\phi/64$       |
|         | 1              | 0              | 0              | External clock: counts on TCLKA pin input |
|         |                |                | 1              | External clock: counts on TCLKB pin input |
|         |                | 1              | 0              | External clock: counts on TCLKC pin input |
|         |                |                | 1              | External clock: counts on TCLKD pin input |

**Table 11.7 TPSC2 to TPSC0 (Channel 1)**

| Channel | Bit 2<br>TPSC2 | Bit 1<br>TPSC1 | Bit 0<br>TPSC0 | Description                               |
|---------|----------------|----------------|----------------|---|
| 1       | 0              | 0              | 0              | Internal clock: counts on $\phi/1$        |
|         |                |                | 1              | Internal clock: counts on $\phi/4$        |
|         |                | 1              | 0              | Internal clock: counts on $\phi/16$       |
|         |                |                | 1              | Internal clock: counts on $\phi/64$       |
|         | 1              | 0              | 0              | External clock: counts on TCLKA pin input |
|         |                |                | 1              | External clock: counts on TCLKB pin input |
|         |                | 1              | 0              | Internal clock: counts on $\phi/256$      |
|         |                |                | 1              | Counts on TCNT2 overflow/underflow        |

Note: This setting is ignored when channel 1 is in phase counting mode.

**Table 11.8 TPSC2 to TPSC0 (Channel 2)**

| Channel | Bit 2<br>TPSC2 | Bit 1<br>TPSC1 | Bit 0<br>TPSC0 | Description                               |
|---------|----------------|----------------|----------------|---|
| 2       | 0              | 0              | 0              | Internal clock: counts on $\phi/1$        |
|         |                |                | 1              | Internal clock: counts on $\phi/4$        |
|         |                | 1              | 0              | Internal clock: counts on $\phi/16$       |
|         |                |                | 1              | Internal clock: counts on $\phi/64$       |
|         | 1              | 0              | 0              | External clock: counts on TCLKA pin input |
|         |                |                | 1              | External clock: counts on TCLKB pin input |
|         |                | 1              | 0              | External clock: counts on TCLKC pin input |
|         |                |                | 1              | Internal clock: counts on $\phi/1024$     |

Note: This setting is ignored when channel 2 is in phase counting mode.

**Table 11.9 TPSC2 to TPSC0 (Channel 3)**

| Channel | Bit 2<br>TPSC2 | Bit 1<br>TPSC1 | Bit 0<br>TPSC0 | Description                               |
|---------|----------------|----------------|----------------|---|
| 3       | 0              | 0              | 0              | Internal clock: counts on $\phi/1$        |
|         |                |                | 1              | Internal clock: counts on $\phi/4$        |
|         |                | 1              | 0              | Internal clock: counts on $\phi/16$       |
|         |                |                | 1              | Internal clock: counts on $\phi/64$       |
|         | 1              | 0              | 0              | External clock: counts on TCLKA pin input |
|         |                |                | 1              | Internal clock: counts on $\phi/1024$     |
|         |                | 1              | 0              | Internal clock: counts on $\phi/256$      |
|         |                |                | 1              | Internal clock: counts on $\phi/4096$     |

**Table 11.10 TPSC2 to TPSC0 (Channel 4)**

| Channel | Bit 2<br>TPSC2 | Bit 1<br>TPSC1 | Bit 0<br>TPSC0 | Description                               |
|---------|----------------|----------------|----------------|---|
| 4       | 0              | 0              | 0              | Internal clock: counts on $\phi/1$        |
|         |                |                | 1              | Internal clock: counts on $\phi/4$        |
|         |                | 1              | 0              | Internal clock: counts on $\phi/16$       |
|         |                |                | 1              | Internal clock: counts on $\phi/64$       |
|         | 1              | 0              | 0              | External clock: counts on TCLKA pin input |
|         |                |                | 1              | External clock: counts on TCLKC pin input |
|         |                | 1              | 0              | Internal clock: counts on $\phi/1024$     |
|         |                |                | 1              | Counts on TCNT5 overflow/underflow        |

Note: This setting is ignored when channel 4 is in phase counting mode.

**Table 11.11 TPSC2 to TPSC0 (Channel 5)**

| Channel | Bit 2<br>TPSC2 | Bit 1<br>TPSC1 | Bit 0<br>TPSC0 | Description                               |
|---------|----------------|----------------|----------------|---|
| 5       | 0              | 0              | 0              | Internal clock: counts on $\phi/1$        |
|         |                |                | 1              | Internal clock: counts on $\phi/4$        |
|         |                | 1              | 0              | Internal clock: counts on $\phi/16$       |
|         |                |                | 1              | Internal clock: counts on $\phi/64$       |
|         | 1              | 0              | 0              | External clock: counts on TCLKA pin input |
|         |                |                | 1              | External clock: counts on TCLKC pin input |
|         |                | 1              | 0              | Internal clock: counts on $\phi/256$      |
|         |                |                | 1              | External clock: counts on TCLKD pin input |

Note: This setting is ignored when channel 5 is in phase counting mode.

### 11.3.2 Timer Mode Register (TMDR)

TMDR registers are used to set the operating mode for each channel. The TPU has six TMDR registers, one for each channel. TMDR register settings should be made only when TCNT operation is stopped.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | —        | 1             | —   | Reserved  |
| 6   | —        | 1             | —   | These bits are always read as 1 and cannot be modified.   |
| 5   | BFB      | 0             | R/W | <p>Buffer Operation B</p> <p>Specifies whether TGRB is to operate in the normal way, or TGRB and TGRD are to be used together for buffer operation. When TGRD is used as a buffer register, TGRD input capture/output compare is not generated.</p> <p>In channels 1, 2, 4, and 5, which have no TGRD, bit 5 is reserved. It is always read as 0 and cannot be modified.</p> <p>0: TGRB operates normally<br/>1: TGRB and TGRD used together for buffer operation</p> |
| 4   | BFA      | 0             | R/W | <p>Buffer Operation A</p> <p>Specifies whether TGRA is to operate in the normal way, or TGRA and TGRC are to be used together for buffer operation. When TGRC is used as a buffer register, TGRC input capture/output compare is not generated.</p> <p>In channels 1, 2, 4, and 5, which have no TGRC, bit 4 is reserved. It is always read as 0 and cannot be modified.</p> <p>0: TGRA operates normally<br/>1: TGRA and TGRC used together for buffer operation</p> |
| 3   | MD3      | 0             | R/W | Modes 3 to 0  |
| 2   | MD2      | 0             | R/W | These bits are used to set the timer operating mode.  |
| 1   | MD1      | 0             | R/W |   |
| 0   | MD0      | 0             | R/W | MD3 is a reserved bit. The write value should always be 0. See table 11.12 for details.   |

**Table 11.12 MD3 to MD0**

| Bit 3<br>MD3* <sup>1</sup> | Bit 2<br>MD2* <sup>2</sup> | Bit 1<br>MD1 | Bit 0<br>MD0 | Description      |            |                       |                       |
|----------------------------|----------------------------|--------------|--------------|------------------|------------|-----------------------|-----------------------|
| 0                          | 0                          | 0            | 0            | Normal operation |            |                       |                       |
|                            |                            |              | 1            | Reserved         |            |                       |                       |
|                            | 1                          | 0            | 1            | 0                | PWM mode 1 |                       |                       |
|                            |                            |              |              | 1                | PWM mode 2 |                       |                       |
|                            |                            | 1            | 0            | 0                | 0          | Phase counting mode 1 |                       |
|                            |                            |              |              |                  | 1          | Phase counting mode 2 |                       |
|                            |                            |              | 1            | 1                | 0          | 0                     | Phase counting mode 3 |
|                            |                            |              |              |                  |            | 1                     | Phase counting mode 4 |
| 1                          | x                          | x            | x            | —                |            |                       |                       |

[Legend]

x: Don't care

- Notes:
1. MD3 is a reserved bit. In a write, it should always be written with 0.
  2. Phase counting mode cannot be set for channels 0 and 3. In this case, 0 should always be written to MD2.

### 11.3.3 Timer I/O Control Register (TIOR)

TIOR registers control the TGR registers. The TPU has eight TIOR registers, two each for channels 0 and 3, and one each for channels 1, 2, 4, and 5. Care is required since TIOR is affected by the TMDR setting.

The initial output specified by TIOR is valid when the counter is stopped (the CST bit in TSTR is cleared to 0). Note also that, in PWM mode 2, the output at the point at which the counter is cleared to 0 is specified.

When TGRC or TGRD is designated for buffer operation, this setting is invalid and the register operates as a buffer register.

#### TIORH\_0, TIOR\_1, TIOR\_2, TIORH\_3, TIOR\_4, TIOR\_5

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | IOB3     | 0             | R/W | I/O Control B3 to B0  |
| 6   | IOB2     | 0             | R/W | Specify the function of TGRB.   |
| 5   | IOB1     | 0             | R/W | For details, see tables 11.13, 11.15, 11.16, 11.17, 11.19, and 11.20. |
| 4   | IOB0     | 0             | R/W |   |
| 3   | IOA3     | 0             | R/W | I/O Control A3 to A0  |
| 2   | IOA2     | 0             | R/W | Specify the function of TGRA.   |
| 1   | IOA1     | 0             | R/W | For details, see tables 11.21, 11.23, 11.24, 11.25, 11.27, and 11.28. |
| 0   | IOA0     | 0             | R/W |   |

#### TIORL\_0, TIORL\_3

| Bit | Bit Name | Initial Value | R/W | Description                              |
|-----|----------|---------------|-----|--|
| 7   | IOD3     | 0             | R/W | I/O Control D3 to D0                     |
| 6   | IOD2     | 0             | R/W | Specify the function of TGRD.            |
| 5   | IOD1     | 0             | R/W | For details, see tables 11.14 and 11.18. |
| 4   | IOD0     | 0             | R/W |  |
| 3   | IOC3     | 0             | R/W | I/O Control C3 to C0                     |
| 2   | IOC2     | 0             | R/W | Specify the function of TGRC.            |
| 1   | IOC1     | 0             | R/W | For details, see tables 11.22 and 11.26. |
| 0   | IOC0     | 0             | R/W |  |

Table 11.13 TIORH\_0

### 11.3.4 Timer Interrupt Enable Register (TIER)

TIER registers control enabling or disabling of interrupt requests for each channel. The TPU has six TIER registers, one for each channel.

| Bit | Bit Name | Initial value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | TTGE     | 0             | R/W | <p>A/D Conversion Start Request Enable</p> <p>Enables or disables generation of A/D conversion start requests by TGRA input capture/compare match.</p> <p>0: A/D conversion start request generation disabled<br/>1: A/D conversion start request generation enabled</p>  |
| 6   | —        | 1             | —   | <p>Reserved</p> <p>This bit is always read as 1 and cannot be modified.</p>   |
| 5   | TCIEU    | 0             | R/W | <p>Underflow Interrupt Enable</p> <p>Enables or disables interrupt requests (TCIU) by the TCFU flag when the TCFU flag in TSR is set to 1 in channels 1, 2, 4, and 5.</p> <p>In channels 0 and 3, bit 5 is reserved. It is always read as 0 and cannot be modified.</p> <p>0: Interrupt requests (TCIU) by TCFU disabled<br/>1: Interrupt requests (TCIU) by TCFU enabled</p>   |
| 4   | TCIEV    | 0             | R/W | <p>Overflow Interrupt Enable</p> <p>Enables or disables interrupt requests (TCIV) by the TCFV flag when the TCFV flag in TSR is set to 1.</p> <p>0: Interrupt requests (TCIV) by TCFV disabled<br/>1: Interrupt requests (TCIV) by TCFV enabled</p>   |
| 3   | TGIED    | 0             | R/W | <p>TGR Interrupt Enable D</p> <p>Enables or disables interrupt requests (TGID) by the TGFD bit when the TGFD bit in TSR is set to 1 in channels 0 and 3.</p> <p>In channels 1, 2, 4, and 5, bit 3 is reserved. It is always read as 0 and cannot be modified.</p> <p>0: Interrupt requests (TGID) by TGFD bit disabled<br/>1: Interrupt requests (TGID) by TGFD bit enabled</p> |

| Bit | Bit Name | Initial value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 2   | TGIEC    | 0             | R/W | <p>TGR Interrupt Enable C</p> <p>Enables or disables interrupt requests (TGIC) by the TGFC bit when the TGFC bit in TSR is set to 1 in channels 0 and 3.</p> <p>In channels 1, 2, 4, and 5, bit 2 is reserved. It is always read as 0 and cannot be modified.</p> <p>0: Interrupt requests (TGIC) by TGFC bit disabled<br/>1: Interrupt requests (TGIC) by TGFC bit enabled</p> |
| 1   | TGIEB    | 0             | R/W | <p>TGR Interrupt Enable B</p> <p>Enables or disables interrupt requests (TGIB) by the TGFB bit when the TGFB bit in TSR is set to 1.</p> <p>0: Interrupt requests (TGIB) by TGFB bit disabled<br/>1: Interrupt requests (TGIB) by TGFB bit enabled</p>  |
| 0   | TGIEA    | 0             | R/W | <p>TGR Interrupt Enable A</p> <p>Enables or disables interrupt requests (TGIA) by the TGFA bit when the TGFA bit in TSR is set to 1.</p> <p>0: Interrupt requests (TGIA) by TGFA bit disabled<br/>1: Interrupt requests (TGIA) by TGFA bit enabled</p>  |

### 11.3.5 Timer Status Register (TSR)

TSR registers indicate the status of each channel. The TPU has six TSR registers, one for each channel.

| Bit | Bit Name | Initial value | R/W                 | Description   |
|-----|----------|---------------|---------------------|---|
| 7   | TCFD     | 1             | R                   | <p>Count Direction Flag</p> <p>Status flag that shows the direction in which TCNT counts in channels 1, 2, 4, and 5.<br/>In channels 0 and 3, bit 7 is reserved. It is always read as 1 and cannot be modified.</p> <p>0: TCNT counts down<br/>1: TCNT counts up</p>  |
| 6   | —        | 1             | —                   | <p>Reserved</p> <p>This bit is always read as 1 and cannot be modified.</p>   |
| 5   | TCFU     | 0             | R/(W)* <sup>1</sup> | <p>Underflow Flag</p> <p>Status flag that indicates that TCNT underflow has occurred when channels 1, 2, 4, and 5 are set to phase counting mode.<br/>In channels 0 and 3, bit 5 is reserved. It is always read as 0 and cannot be modified.</p> <p>[Setting condition]<br/>When the TCNT value underflows (changes from H'0000 to H'FFFF)</p> <p>[Clearing condition]<br/>When 0 is written to TCFU after reading TCFU = 1</p> |
| 4   | TCFV     | 0             | R/(W)* <sup>1</sup> | <p>Overflow Flag</p> <p>Status flag that indicates that TCNT overflow has occurred.</p> <p>[Setting condition]<br/>When the TCNT value overflows (changes from H'FFFF to H'0000)</p> <p>[Clearing condition]<br/>When 0 is written to TCFV after reading TCFV = 1</p>   |

| Bit | Bit Name | Initial value | R/W                 | Description  |
|-----|----------|---------------|---------------------|--|
| 3   | TGFD     | 0             | R/(W)* <sup>1</sup> | <p>Input Capture/Output Compare Flag D</p> <p>Status flag that indicates the occurrence of TGRD input capture or compare match in channels 0 and 3.</p> <p>In channels 1, 2, 4, and 5, bit 3 is reserved. It is always read as 0 and cannot be modified.</p> <p>[Setting conditions]</p> <ul style="list-style-type: none"> <li>• When TCNT = TGRD while TGRD is functioning as output compare register</li> <li>• When TCNT value is transferred to TGRD by input capture signal while TGRD is functioning as input capture register</li> </ul> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> <li>• When DTC is activated by TGID interrupt while DISEL bit of MRB in DTC is 0</li> <li>• When 0 is written to TGFD after reading TGFD = 1</li> </ul> |
| 2   | TGFC     | 0             | R/(W)* <sup>1</sup> | <p>Input Capture/Output Compare Flag C</p> <p>Status flag that indicates the occurrence of TGRC input capture or compare match in channels 0 and 3.</p> <p>In channels 1, 2, 4, and 5, bit 2 is reserved. It is always read as 0 and cannot be modified.</p> <p>[Setting conditions]</p> <ul style="list-style-type: none"> <li>• When TCNT = TGRC while TGRC is functioning as output compare register</li> <li>• When TCNT value is transferred to TGRC by input capture signal while TGRC is functioning as input capture register</li> </ul> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> <li>• When DTC is activated by TGIC interrupt while DISEL bit of MRB in DTC is 0</li> <li>• When 0 is written to TGFC after reading TGFC = 1</li> </ul> |

| Bit | Bit Name | Initial value | R/W                 | Description   |
|-----|----------|---------------|---------------------|---|
| 1   | TGFB     | 0             | R/(W)* <sup>1</sup> | <p>Input Capture/Output Compare Flag B</p> <p>Status flag that indicates the occurrence of TGRB input capture or compare match.</p> <p>[Setting conditions]</p> <ul style="list-style-type: none"> <li>• When TCNT = TGRB while TGRB is functioning as output compare register</li> <li>• When TCNT value is transferred to TGRB by input capture signal while TGRB is functioning as input capture register</li> </ul> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> <li>• When DTC is activated by TGIB interrupt while DISEL bit of MRB in DTC is 0</li> <li>• When 0 is written to TGFB after reading TGFB = 1</li> </ul>   |
| 0   | TGFA     | 0             | R/(W)* <sup>1</sup> | <p>Input Capture/Output Compare Flag A</p> <p>Status flag that indicates the occurrence of TGRA input capture or compare match.</p> <p>[Setting conditions]</p> <p>When TCNT = TGRA while TGRA is functioning as output compare register</p> <p>When TCNT value is transferred to TGRA by input capture signal while TGRA is functioning as input capture register</p> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> <li>• When DTC is activated by TGIA interrupt while DISEL bit of MRB in DTC is 0</li> <li>• When DMAC is activated by TGIA interrupt while DTE bit of DMABCR in DTC is 1*<sup>2</sup></li> <li>• When 0 is written to TGFA after reading TGFA = 1</li> </ul> |

Notes: 1. Only 0 can be written, for flag clearing.  
 2. Only available in unit 0.

### 11.3.6 Timer Counter (TCNT)

The TCNT registers are 16-bit readable/writable counters. The TPU has six TCNT counters, one for each channel.

The TCNT counters are initialized to H'0000 by a reset, or in hardware standby mode.

The TCNT counters cannot be accessed in 8-bit units; they must always be accessed as a 16-bit unit.

### 11.3.7 Timer General Register (TGR)

The TGR registers are 16-bit readable/writable registers with a dual function as output compare and input capture registers. The TPU has 16 TGR registers, four each for channels 0 and 3 and two each for channels 1, 2, 4, and 5. TGRC and TGRD for channels 0 and 3 can also be designated for operation as buffer registers. The TGR registers cannot be accessed in 8-bit units; they must always be accessed as a 16-bit unit. TGR buffer register combinations are TGRA–TGRC and TGRB–TGRD.

### 11.3.8 Timer Start Register (TSTR)

TSTR selects operation/stoppage for channels 0 to 5. When setting the operating mode in TMDR or setting the count clock in TCR, first stop the TCNT counter.

| Bit | Bit Name | Initial value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | —        | 0             | —   | Reserved   |
| 6   | —        | 0             | —   | The write value should always be 0.  |
| 5   | CST5     | 0             | R/W | Counter Start 5 to 0   |
| 4   | CST4     | 0             | R/W | These bits select operation or stoppage for TCNT.  |
| 3   | CST3     | 0             | R/W | If 0 is written to the CST bit during operation with the TIOC pin designated for output, the counter stops but the TIOC pin output compare output level is retained. If TIOR is written to when the CST bit is cleared to 0, the pin output level will be changed to the set initial output value.<br>0: TCNT_5 to TCNT_0 count operation is stopped<br>1: TCNT_5 to TCNT_0 performs count operation |
| 2   | CST2     | 0             | R/W |  |
| 1   | CST1     | 0             | R/W |  |
| 0   | CST0     | 0             | R/W |  |

### 11.3.9 Timer Synchronous Register (TSYR)

TSYR selects independent operation or synchronous operation for the TCNT counters of channels 0 to 5. A channel performs synchronous operation when the corresponding bit in TSYR is set to 1.

| Bit | Bit Name | Initial value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | —        | 0             | —   | Reserved  |
| 6   | —        | 0             | —   | The write value should always be 0.   |
| 5   | SYNC5    | 0             | R/W | Timer Synchronization 5 to 0  |
| 4   | SYNC4    | 0             | R/W | These bits select whether operation is independent of or synchronized with other channels.  |
| 3   | SYNC3    | 0             | R/W |   |
| 2   | SYNC2    | 0             | R/W | When synchronous operation is selected, synchronous presetting of multiple channels, and synchronous clearing through counter clearing on another channel are possible. |
| 1   | SYNC1    | 0             | R/W |   |
| 0   | SYNC0    | 0             | R/W |   |

To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of bits CCLR2 to CCLR0 in TCR.

0: TCNT\_5 to TCNT\_0 operates independently (TCNT presetting/clearing is unrelated to other channels)

1: TCNT\_5 to TCNT\_0 performs synchronous operation (TCNT synchronous presetting/synchronous clearing is possible)

### 11.3.10 Timer Start Register B (TSTRB)

TSTRB selects operation/stoppage for channels 6 to 11. When setting the operating mode in TMDR or setting the count clock in TCR, first stop the TCNT counter.

| Bit | Bit Name | Initial value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | —        | 0             | —   | Reserved   |
| 6   | —        | 0             | —   | The write value should always be 0.  |
| 5   | CST11    | 0             | R/W | Counter Start 11 to 6  |
| 4   | CST10    | 0             | R/W | These bits select operation or stoppage for TCNT.  |
| 3   | CST9     | 0             | R/W | If 0 is written to the CST bit during operation with the TIOC pin designated for output, the counter stops but the TIOC pin output compare output level is retained. If TIOR is written to when the CST bit is cleared to 0, the pin output level will be changed to the set initial output value.<br>0: TCNT_11 to TCNT_6 count operation is stopped<br>1: TCNT_11 to TCNT_6 performs count operation |
| 2   | CST8     | 0             | R/W |  |
| 1   | CST7     | 0             | R/W |  |
| 0   | CST6     | 0             | R/W |  |
|     |          |               |     |  |

### 11.3.11 Timer Synchronous Register B (TSYRB)

TSYRB selects independent operation or synchronous operation for the TCNT counters of channels 6 to 11. A channel performs synchronous operation when the corresponding bit in TSYRB is set to 1.

| Bit | Bit Name | Initial value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | —        | 0             | —   | Reserved  |
| 6   | —        | 0             | —   | The write value should always be 0.   |
| 5   | SYNC11   | 0             | R/W | Timer Synchronization 11 to 6   |
| 4   | SYNC10   | 0             | R/W | These bits select whether operation is independent of or synchronized with other channels.  |
| 3   | SYNC9    | 0             | R/W |   |
| 2   | SYNC8    | 0             | R/W | When synchronous operation is selected, synchronous presetting of multiple channels, and synchronous clearing through counter clearing on another channel are possible.<br><br>To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of bits CCLR2 to CCLR0 in TCR.<br><br>0: TCNT_11 to TCNT_6 operates independently (TCNT presetting/clearing is unrelated to other channels)<br><br>1: TCNT_11 to TCNT_6 performs synchronous operation (TCNT synchronous presetting/synchronous clearing is possible) |
| 1   | SYNC7    | 0             | R/W |   |
| 0   | SYNC6    | 0             | R/W |   |

## 11.4 Operation

### 11.4.1 Basic Functions

Each channel has a TCNT and TGR register. TCNT performs up-counting, and is also capable of free-running operation, periodic counting, and external event counting.

Each TGR can be used as an input capture register or output compare register.

#### (1) Counter Operation

When one of bits CST0 to CST5 is set to 1 in TSTR, the TCNT counter for the corresponding channel starts counting. TCNT can operate as a free-running counter, periodic counter, and so on.

#### (a) Example of count operation setting procedure

Figure 11.3 shows an example of the count operation setting procedure.

**Figure 11.3 Example of Counter Operation Setting Procedure**

## (b) Free-running count operation and periodic count operation

Immediately after a reset, the TPU's TCNT counters are all designated as free-running counters. When the relevant bit in TSTR is set to 1 the corresponding TCNT counter starts up-count operation as a free-running counter. When TCNT overflows (changes from H'FFFF to H'0000), the TCFV bit in TSR is set to 1. If the value of the corresponding TCIEV bit in TIER is 1 at this point, the TPU requests an interrupt. After overflow, TCNT starts counting up again from H'0000.

Figure 11.4 illustrates free-running counter operation.

**Figure 11.4 Free-Running Counter Operation**

When compare match is selected as the TCNT clearing source, the TCNT counter for the relevant channel performs periodic count operation. The TGR register for setting the period is designated as an output compare register, and counter clearing by compare match is selected by means of bits CCLR2 to CCLR0 in TCR. After the settings have been made, TCNT starts count-up operation as a periodic counter when the corresponding bit in TSTR is set to 1. When the count value matches the value in TGR, the TGF bit in TSR is set to 1 and TCNT is cleared to H'0000.

If the value of the corresponding TGIE bit in TIER is 1 at this point, the TPU requests an interrupt. After a compare match, TCNT starts counting up again from H'0000.

Figure 11.5 illustrates periodic counter operation.

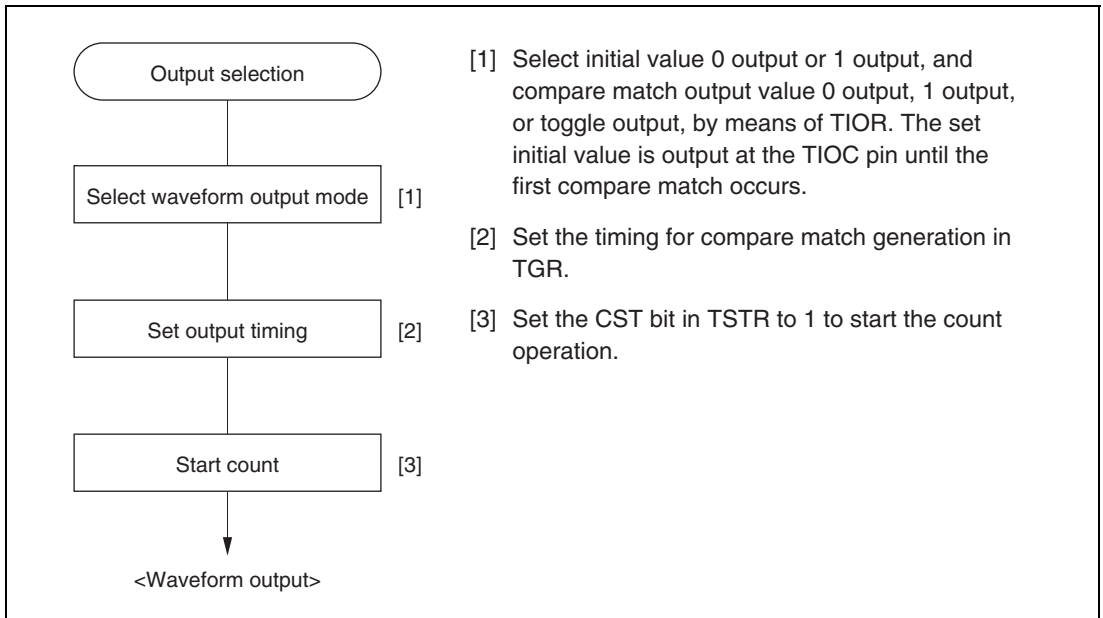

**Figure 11.5 Periodic Counter Operation**

## (2) Waveform Output by Compare Match

The TPU can perform 0, 1, or toggle output from the corresponding output pin using a compare match.

### (a) Example of setting procedure for waveform output by compare match

Figure 11.6 shows an example of the setting procedure for waveform output by a compare match.

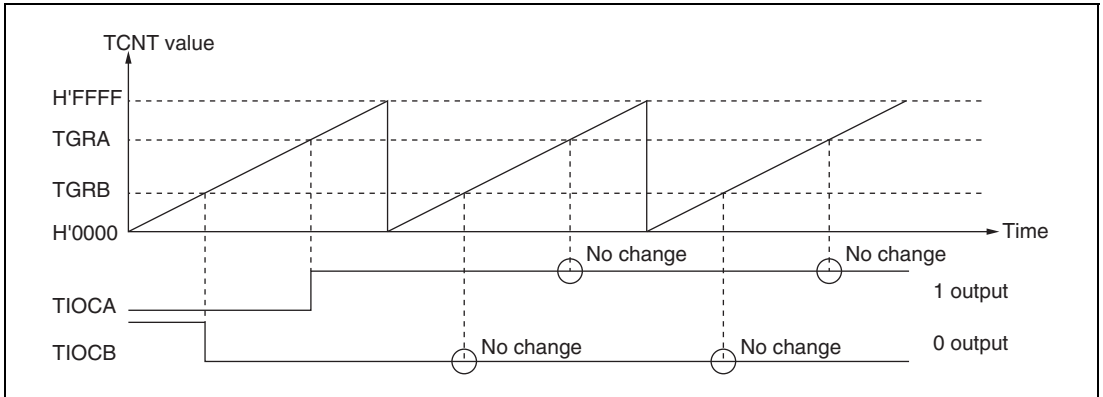

**Figure 11.6 Example of Setting Procedure for Waveform Output by Compare Match**

## (b) Examples of waveform output operation

Figure 11.7 shows an example of 0 output/1 output.

In this example, TCNT has been designated as a free-running counter, and settings have been made so that 1 is output by compare match A, and 0 is output by compare match B. When the set level and the pin level match, the pin level does not change.

**Figure 11.7 Example of 0 Output/1 Output Operation**

Figure 11.8 shows an example of toggle output.

In this example TCNT has been designated as a periodic counter (with counter clearing performed by compare match B), and settings have been made so that output is toggled by both compare match A and compare match B.

**Figure 11.8 Example of Toggle Output Operation**

### (3) Input Capture Function

The TCNT value can be transferred to TGR on detection of the TIOC pin input edge.

Rising edge, falling edge, or both edges can be selected as the detection edge. For channels 0, 1, 3, 4, 6, 7, 9, and 10 it is also possible to specify another channel's counter input clock or compare match signal as the input capture source.

Note: When another channel's counter input clock is used as the input capture input for channels 0, 3, 6, and 9,  $\phi/1$  should not be selected as the counter input clock used for input capture input. Input capture will not be generated if  $\phi/1$  is selected.

#### (a) Example of setting procedure for input capture operation

Figure 11.9 shows an example of the setting procedure for input capture operation.

**Figure 11.9 Example of Setting Procedure for Input Capture Operation**

## (b) Example of input capture operation

Figure 11.10 shows an example of input capture operation.

In this example both rising and falling edges have been selected as the TIOCA pin input capture input edge, falling edge has been selected as the TIOCB pin input capture input edge, and counter clearing by TGRB input capture has been designated for TCNT.

**Figure 11.10 Example of Input Capture Operation**

### 11.4.2 Synchronous Operation

In synchronous operation, the values in multiple TCNT counters can be rewritten simultaneously (synchronous presetting). Also, multiple of TCNT counters can be cleared simultaneously (synchronous clearing) by making the appropriate setting in TCR.

Synchronous operation enables TGR to be incremented with respect to a single time base.

Channels 0 to 5 and 6 to 11 can all be designated for synchronous operation.

## (1) Example of Synchronous Operation Setting Procedure

Figure 11.11 shows an example of the synchronous operation setting procedure.

**Figure 11.11 Example of Synchronous Operation Setting Procedure**

## (2) Example of Synchronous Operation

Figure 11.12 shows an example of synchronous operation.

In this example, synchronous operation and PWM mode 1 have been designated for channels 0 to 2, TGRB\_0 compare match has been set as the channel 0 counter clearing source, and synchronous clearing has been set for the channel 1 and 2 counter clearing source.

Three-phase PWM waveforms are output from pins TIOCA0, TIOCA1, and TIOCA2. At this time, synchronous presetting, and synchronous clearing by TGRB\_0 compare match, is performed for channel 0 to 2 TCNT counters, and the data set in TGRB\_0 is used as the PWM cycle.

For details on PWM modes, see section 11.4.5, PWM Modes.

**Figure 11.12 Example of Synchronous Operation**

### 11.4.3 Buffer Operation

Buffer operation, provided for channels 0, 3, 6, and 9, enables TGRC and TGRD to be used as buffer registers.

Buffer operation differs depending on whether TGR has been designated as an input capture register or a compare match register.

Table 11.29 shows the register combinations used in buffer operation.

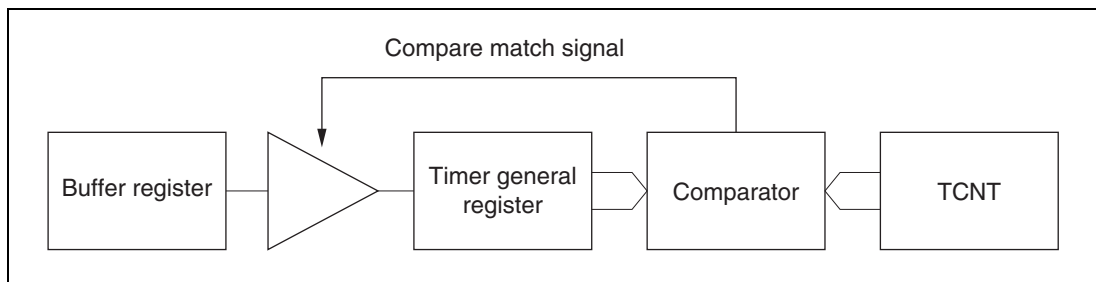

**Table 11.29 Register Combinations in Buffer Operation**

| Unit | Channel | Timer General Register | Buffer Register |
|------|---------|------------------------|-----------------|
| 0    | 0       | TGRA_0                 | TGRC_0          |
|      |         | TGRB_0                 | TGRD_0          |
|      | 3       | TGRA_3                 | TGRC_3          |
|      |         | TGRB_3                 | TGRD_3          |
| 1    | 6       | TGRA_6                 | TGRC_6          |
|      |         | TGRB_6                 | TGRD_6          |
|      | 9       | TGRA_9                 | TGRC_9          |
|      |         | TGRB_9                 | TGRD_9          |

- When TGR is an output compare register

When a compare match occurs, the value in the buffer register for the corresponding channel is transferred to the timer general register.

This operation is illustrated in figure 11.13.

**Figure 11.13 Compare Match Buffer Operation**

- When TGR is an input capture register

When input capture occurs, the value in TCNT is transferred to TGR and the value previously held in the timer general register is transferred to the buffer register.

This operation is illustrated in figure 11.14.

**Figure 11.14 Input Capture Buffer Operation**

### (1) Example of Buffer Operation Setting Procedure

Figure 11.15 shows an example of the buffer operation setting procedure.

**Figure 11.15 Example of Buffer Operation Setting Procedure**

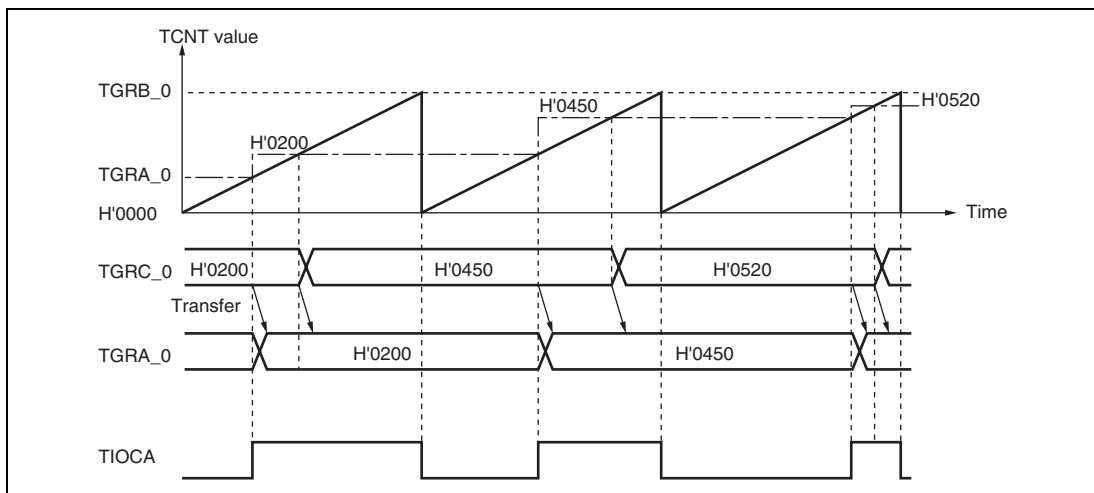

## (2) Examples of Buffer Operation

### (a) When TGR is an output compare register

Figure 11.16 shows an operation example in which PWM mode 1 has been designated for channel 0, and buffer operation has been designated for TGRA and TGRC. The settings used in this example are TCNT clearing by compare match B, 1 output at compare match A, and 0 output at compare match B.

As buffer operation has been set, when compare match A occurs the output changes and the value in buffer register TGRC is simultaneously transferred to timer general register TGRA. This operation is repeated each time compare match A occurs.

For details on PWM modes, see section 11.4.5, PWM Modes.

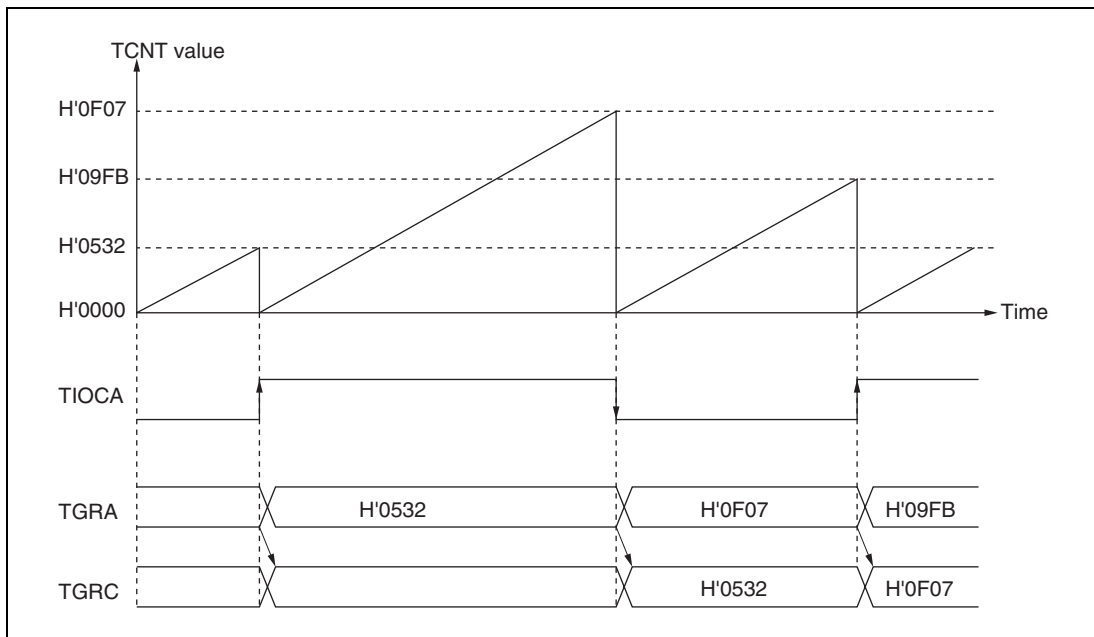

**Figure 11.16 Example of Buffer Operation (1)**

**(b) When TGR is an input capture register**

Figure 11.17 shows an operation example in which TGRA has been designated as an input capture register, and buffer operation has been designated for TGRA and TGRC.

Counter clearing by TGRA input capture has been set for TCNT, and both rising and falling edges have been selected as the TIOCA pin input capture input edge.

As buffer operation has been set, when the TCNT value is stored in TGRA upon occurrence of input capture A, the value previously stored in TGRA is simultaneously transferred to TGRC.

**Figure 11.17 Example of Buffer Operation (2)**

### 11.4.4 Cascaded Operation

In cascaded operation, two 16-bit counters for different channels are used together as a 32-bit counter.

This function works by counting the channel 1 (channel 4, channel 7, or channel 10) counter clock at overflow/underflow of TCNT\_2 (TCNT\_5, TCNT\_8, or TCNT\_11) as set in bits TPSC2 to TPSC0 in TCR.

Underflow occurs only when the lower 16-bit TCNT is in phase-counting mode.

Table 11.30 shows the register combinations used in cascaded operation.

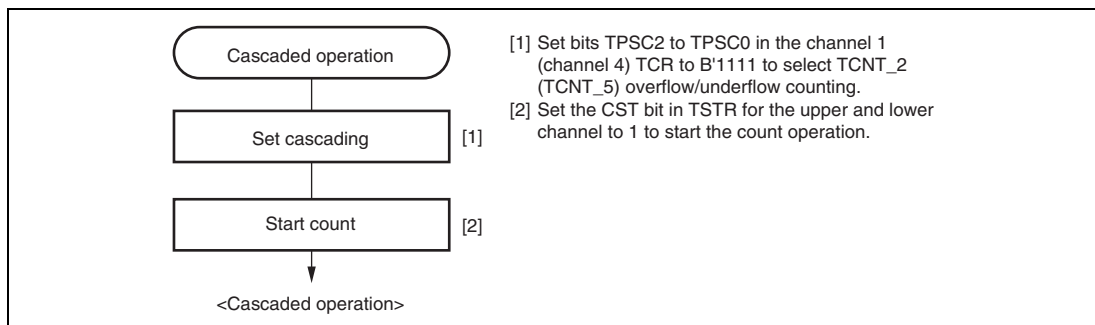

Note: When phase counting mode is set for channel 1, 4, 7, or 10, the counter clock setting is invalid and the counter operates independently in phase counting mode.

**Table 11.30 Cascaded Combinations**

| Combination        | Upper 16 Bits | Lower 16 Bits |
|--------------------|---------------|---------------|
| Channels 1 and 2   | TCNT_1        | TCNT_2        |
| Channels 4 and 5   | TCNT_4        | TCNT_5        |
| Channels 7 and 8   | TCNT_7        | TCNT_8        |
| Channels 10 and 11 | TCNT_10       | TCNT_11       |

#### (1) Example of Cascaded Operation Setting Procedure

Figure 11.18 shows an example of the setting procedure for cascaded operation.

**Figure 11.18 Cascaded Operation Setting Procedure**

## (2) Examples of Cascaded Operation

Figure 11.19 illustrates the operation when counting upon TCNT\_2 overflow/underflow has been set for TCNT\_1, TGRA\_1 and TGRA\_2 have been designated as input capture registers, and the TIOC pin rising edge has been selected.

When a rising edge is input to the TIOCA1 and TIOCA2 pins simultaneously, the upper 16 bits of the 32-bit data are transferred to TGRA\_1, and the lower 16 bits to TGRA\_2.

**Figure 11.19 Example of Cascaded Operation (1)**

Figure 11.20 illustrates the operation when counting upon TCNT\_2 overflow/underflow has been set for TCNT\_1, and phase counting mode has been designated for channel 2.

TCNT\_1 is incremented by TCNT\_2 overflow and decremented by TCNT\_2 underflow.

**Figure 11.20 Example of Cascaded Operation (2)**

### 11.4.5 PWM Modes

In PWM mode, PWM waveforms are output from the output pins. 0, 1, or toggle output can be selected as the output level in response to compare match of each TGR.

Settings of TGR registers can output a PWM waveform in the range of 0-% to 100-% duty cycle.

Designating TGR compare match as the counter clearing source enables the cycle to be set in that register. All channels can be designated for PWM mode independently. Synchronous operation is also possible.

There are two PWM modes, as described below.

- PWM mode 1

PWM output is generated from the TIOCA and TIOCC pins by pairing TGRA with TGRB and TGRC with TGRD. The outputs specified by bits IOA3 to IOA0 and IOC3 to IOC0 in TIOR are output from the TIOCA and TIOCC pins at compare matches A and C, respectively. The outputs specified by bits IOB3 to IOB0 and IOD3 to IOD0 in TIOR are output at compare matches B and D, respectively. The initial output value is the value set in TGRA or TGRC. If the set values of paired TGRs are identical, the output value does not change when a compare match occurs.

In PWM mode 1, a maximum 8-phase PWM output is possible.

- PWM mode 2

PWM output is generated using one TGR as the cycle register and the others as duty cycle registers. The output specified in TIOR is performed by means of compare matches. Upon counter clearing by a synchronization register compare match, the output value of each pin is the initial value set in TIOR. If the set values of the cycle and duty cycle registers are identical, the output value does not change when a compare match occurs.

In PWM mode 2, a maximum 15-phase PWM output is possible by combined use with synchronous operation.

The correspondence between PWM output pins and registers is shown in table 11.31.

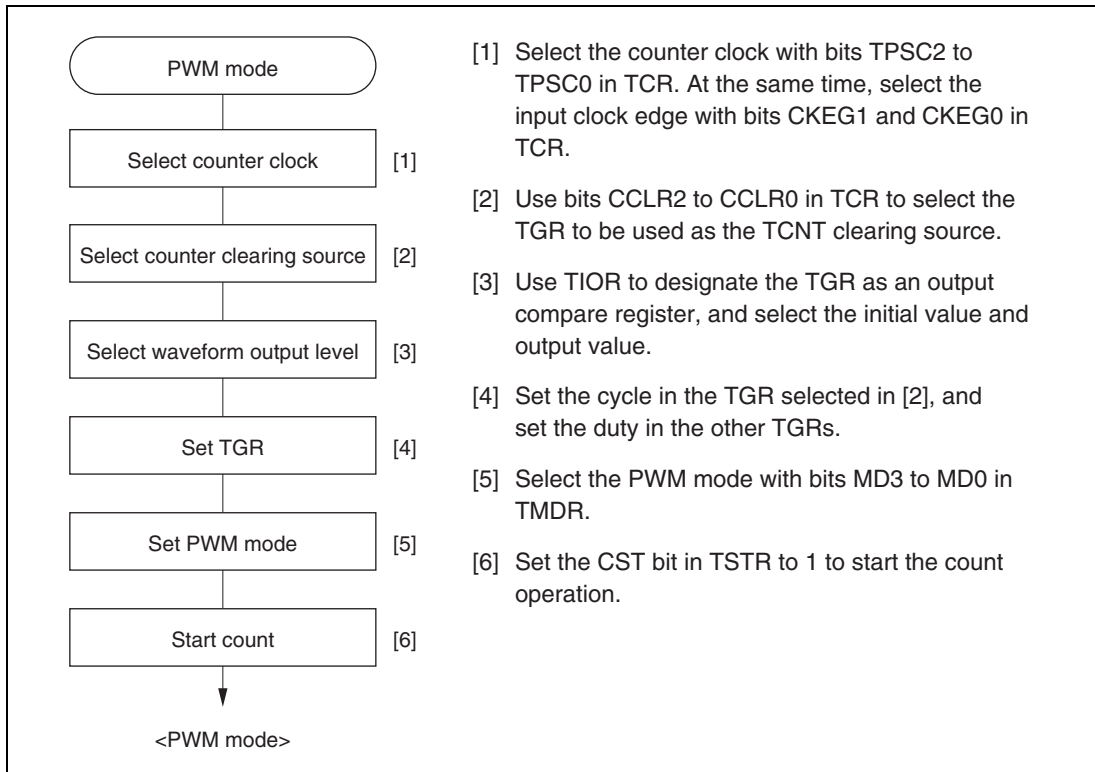

**Table 11.31 PWM Output Registers and Output Pins**

| Unit    | Channel | Registers | Output Pins |            |
|---------|---------|-----------|-------------|------------|
|         |         |           | PWM Mode 1  | PWM Mode 2 |
| 0       | 0       | TGRA_0    | TIOCA0      | TIOCA0     |
|         |         | TGRB_0    |             | TIOCB0     |
|         |         | TGRC_0    | TIOCC0      | TIOCC0     |
|         |         | TGRD_0    |             | TIOCD0     |
|         | 1       | TGRA_1    | TIOCA1      | TIOCA1     |
|         |         | TGRB_1    |             | TIOCB1     |
|         | 2       | TGRA_2    | TIOCA2      | TIOCA2     |
|         |         | TGRB_2    |             | TIOCB2     |
|         | 3       | TGRA_3    | TIOCA3      | TIOCA3     |
|         |         |           |             | TGRB_3     |
|         |         | TGRC_3    | TIOCC3      | TIOCC3     |
|         |         |           |             | TGRD_3     |
|         | 4       | TGRA_4    | TIOCA4      | TIOCA4     |
|         |         | TGRB_4    |             | TIOCB4     |
|         | 5       | TGRA_5    | TIOCA5      | TIOCA5     |
| TGRB_5  |         | TIOCB5    |             |            |
| 1       | 6       | TGRA_6    | TIOCA6      | TIOCA6     |
|         |         | TGRB_6    |             | TIOCB6     |
|         |         | TGRC_6    | TIOCC6      | TIOCC6     |
|         |         | TGRD_6    |             | TIOCD6     |
|         | 7       | TGRA_7    | TIOCA7      | TIOCA7     |
|         |         | TGRB_7    |             | TIOCB7     |
|         | 8       | TGRA_8    | TIOCA8      | TIOCA8     |
|         |         | TGRB_8    |             | TIOCB8     |
|         | 9       | TGRA_9    | TIOCA9      | TIOCA9     |
|         |         |           |             | TGRB_9     |
|         |         | TGRC_9    | TIOCC9      | TIOCC9     |
|         |         |           |             | TGRD_9     |
|         | 10      | TGRA_10   | TIOCA10     | TIOCA10    |
|         |         | TGRB_10   |             | TIOCB10    |
|         | 11      | TGRA_11   | TIOCA11     | TIOCA11    |
| TGRB_11 |         | TIOCB11   |             |            |

Note: In PWM mode 2, PWM output is not possible for the TGR register in which the cycle is set.

## (1) Example of PWM Mode Setting Procedure

Figure 11.21 shows an example of the PWM mode setting procedure.

**Figure 11.21 Example of PWM Mode Setting Procedure**

## (2) Examples of PWM Mode Operation

Figure 11.22 shows an example of PWM mode 1 operation.

In this example, TGRA compare match is set as the TCNT clearing source, 0 is set for the TGRA initial output value and output value, and 1 is set as the TGRB output value.

In this case, the value set in TGRA is used as the cycle, and the values set in TGRB registers as the duty cycle.

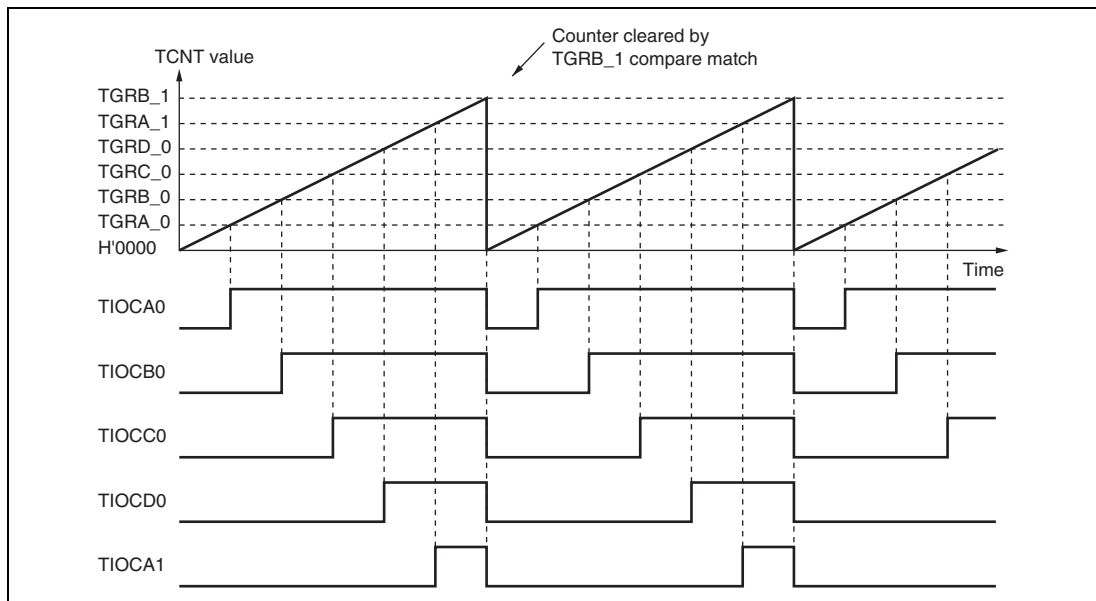

**Figure 11.22 Example of PWM Mode Operation (1)**

Figure 11.23 shows an example of PWM mode 2 operation.

In this example, synchronous operation is designated for channels 0 and 1, TGRB\_1 compare match is set as the TCNT clearing source, and 0 is set for the initial output value and 1 for the output value of the other TGR registers (TGRA\_0 to TGRD\_0, TGRA\_1), to output a 5-phase PWM waveform.

In this case, the value set in TGRB\_1 is used as the cycle, and the values set in the other TGRs as the duty cycle.

**Figure 11.23 Example of PWM Mode Operation (2)**

Figure 11.24 shows examples of PWM waveform output with 0% duty cycle and 100% duty cycle in PWM mode.

**Figure 11.24 Example of PWM Mode Operation (3)**

### 11.4.6 Phase Counting Mode

In phase counting mode, the phase difference between two external clock inputs is detected and TCNT is incremented/decremented accordingly. This mode can be set for channels 1, 2, 4, 5, 7, 8, 10, and 11.

When phase counting mode is set, an external clock is selected as the counter input clock and TCNT operates as an up/down-counter regardless of the setting of bits TPSC2 to TPSC0 and bits CKEG1 and CKEG0 in TCR. However, the functions of bits CCLR1 and CCLR0 in TCR, and of TIOR, TIER, and TGR are valid, and input capture/compare match and interrupt functions can be used.

This can be used for two-phase encoder pulse input.

When overflow occurs while TCNT is counting up, the TCFV flag in TSR is set; when underflow occurs while TCNT is counting down, the TCFU flag is set.

The TCFD bit in TSR is the count direction flag. Reading the TCFD flag provides an indication of whether TCNT is counting up or down.

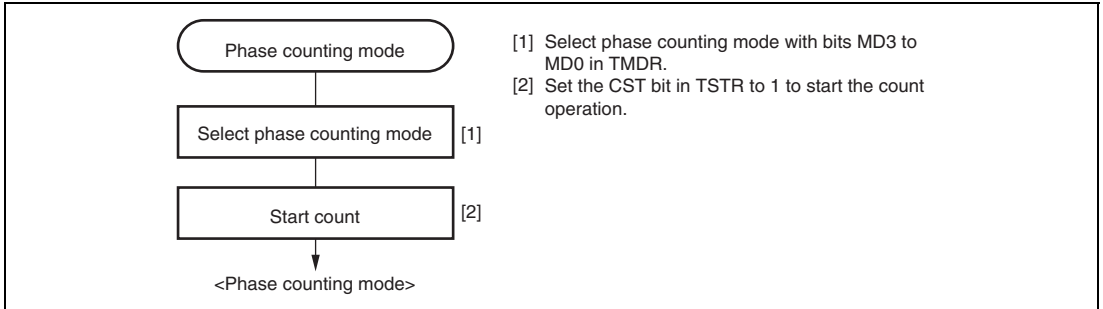

Table 11.32 shows the correspondence between external clock pins and channels.

**Table 11.32 Clock Input Pins in Phase Counting Mode**

| Unit | Channels   | External Clock Pins |         |
|------|--|---------------------|---------|
|      |  | A-Phase             | B-Phase |
| 0    | When channel 1 or 5 is set to phase counting mode  | TCLKA               | TCLKB   |
|      | When channel 2 or 4 is set to phase counting mode  | TCLKC               | TCLKD   |
| 1    | When channel 7 or 11 is set to phase counting mode | TCLKE               | TCLKF   |
|      | When channel 8 or 10 is set to phase counting mode | TCLKG               | TCLKH   |

## (1) Example of Phase Counting Mode Setting Procedure

Figure 11.25 shows an example of the phase counting mode setting procedure.

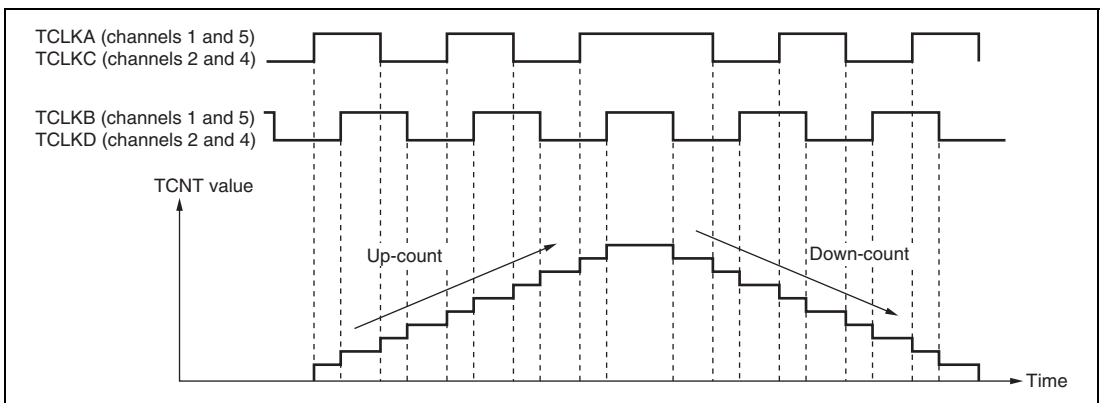

**Figure 11.25 Example of Phase Counting Mode Setting Procedure**

## (2) Examples of Phase Counting Mode Operation

In phase counting mode, TCNT counts up or down according to the phase difference between two external clocks. There are four modes, according to the count conditions.

### a. Phase counting mode 1

Figure 11.26 shows an example of phase counting mode 1 operation, and table 11.33 summarizes the TCNT up/down-count conditions.

**Figure 11.26 Example of Phase Counting Mode 1 Operation**

**Table 11.33 Up/Down-Count Conditions in Phase Counting Mode 1**

| TCLKA (Channels 1 and 5)<br>TCLKC (Channels 2 and 4)<br>TCLKE (Channels 7 and 11)<br>TCLKG (Channels 8 and 10) | TCLKB (Channels 1 and 5)<br>TCLKD (Channels 2 and 4)<br>TCLKF (Channels 7 and 11)<br>TCLKH (Channels 8 and 10) | Operation  |
|--|--|------------|
| High level   |                               | Up-count   |
| Low level  |                               |            |
|                                | Low level  | Down-count |
|                                | High level   |            |
| High level   |                               | Down-count |
| Low level  |                               |            |
|                                | High level   |            |
|                                | Low level  |            |

### (3) Phase Counting Mode Application Example

Figure 11.30 shows an example in which phase counting mode is designated for channel 1, and channel 1 is coupled with channel 0 to input servo motor 2-phase encoder pulses in order to detect the position or speed.

Channel 1 is set to phase counting mode 1, and the encoder pulse A-phase and B-phase are input to TCLKA and TCLKB.

Channel 0 operates with TCNT counter clearing by TGRC\_0 compare match; TGRA\_0 and TGRC\_0 are used for the compare match function, and are set with the speed control cycle and position control cycle. TGRB\_0 is used for input capture, with TGRB\_0 and TGRD\_0 operating in buffer mode. The channel 1 counter input clock is designated as the TGRB\_0 input capture source, and detection of the pulse width of 2-phase encoder 4-multiplication pulses is performed.

TGRA\_1 and TGRB\_1 for channel 1 are designated for input capture, channel 0 TGRA\_0 and TGRC\_0 compare matches are selected as the input capture source, and the up/down-counter values for the control cycles are stored.

This procedure enables accurate position/speed detection to be achieved.

**Figure 11.30 Phase Counting Mode Application Example**

## 11.5 Interrupt Sources

There are three kinds of TPU interrupt source: TGR input capture/compare match, TCNT overflow, and TCNT underflow. Each interrupt source has its own status flag and enable/disable bit, allowing generation of interrupt request signals to be enabled or disabled individually.

When an interrupt request is generated, the corresponding status flag in TSR is set to 1. If the corresponding enable/disable bit in TIER is set to 1 at this time, an interrupt is requested. The interrupt request is cleared by clearing the status flag to 0.

Relative channel priorities can be changed by the interrupt controller, but the priority order within a channel is fixed. For details, see section 5, Interrupt Controller.

Table 11.37 lists the TPU interrupt sources.

**Table 11.37 TPU Interrupts**

| Unit | Channel | Name  | Interrupt Source                   | Interrupt Flag | DTC Activation | DMAC Activation |
|------|---------|-------|------------------------------------|----------------|----------------|-----------------|
| 0    | 0       | TGI0A | TGRA_0 input capture/compare match | TGFA_0         | Possible       | Possible        |
|      |         | TGI0B | TGRB_0 input capture/compare match | TGFB_0         | Possible       | Not possible    |
|      |         | TGI0C | TGRC_0 input capture/compare match | TGFC_0         | Possible       | Not possible    |
|      |         | TGI0D | TGRD_0 input capture/compare match | TGFD_0         | Possible       | Not possible    |
|      |         | TCI0V | TCNT_0 overflow                    | TCFV_0         | Not possible   | Not possible    |

|      |         | TGI9D  | TGRD_9 input capture/compare match  | TGFD_9         | Possible       | Not possible    |
|      |         | TCI9V  | TCNT_9 overflow                     | TCFV_9         | Not possible   | Not possible    |
| 10   |         | TGI10A | TGRA_10 input capture/compare match | TGFA_10        | Possible       | Not possible    |
|      |         | TGI10B | TGRB_10 input capture/compare match | TGFB_10        | Possible       | Not possible    |
|      |         | TCI10V | TCNT_10 overflow                    | TCFV_10        | Not possible   | Not possible    |
|      |         | TCI10U | TCNT_10 underflow                   | TCFU_10        | Not possible   | Not possible    |
| 11   |         | TGI11A | TGRA_11 input capture/compare match | TGFA_11        | Possible       | Not possible    |
|      |         | TGI11B | TGRB_11 input capture/compare match | TGFB_11        | Possible       | Not possible    |
|      |         | TCI11V | TCNT_11 overflow                    | TCFV_11        | Not possible   | Not possible    |
|      |         | TCI11U | TCNT_11 underflow                   | TCFU_11        | Not possible   | Not possible    |

Note: This table shows the initial state immediately after a reset. The relative channel priorities can be changed by the interrupt controller.

### (1) Input Capture/Compare Match Interrupt

An interrupt is requested if the TGIE bit in TIER is set to 1 when the TGF flag in TSR is set to 1 by the occurrence of a TGR input capture/compare match on a particular channel. The interrupt request is cleared by clearing the TGF flag to 0. The TPU has 32 input capture/compare match interrupts, four each for channels 0, 3, 6, and 9, and two each for channels 1, 2, 4, 5, 7, 8, 10, and 11.

### (2) Overflow Interrupt

An interrupt is requested if the TCIEV bit in TIER is set to 1 when the TCFV flag in TSR is set to 1 by the occurrence of TCNT overflow on a channel. The interrupt request is cleared by clearing the TCFV flag to 0. The TPU has 12 overflow interrupts, one for each channel.

### (3) Underflow Interrupt

An interrupt is requested if the TCIEU bit in TIER is set to 1 when the TCFU flag in TSR is set to 1 by the occurrence of TCNT underflow on a channel. The interrupt request is cleared by clearing the TCFU flag to 0. The TPU has eight underflow interrupts, one each for channels 1, 2, 4, 5, 7, 8, 10, and 11.

## 11.6 DTC Activation

The DTC can be activated by the TGR input capture/compare match interrupt for a channel. For details, see section 9, Data Transfer Controller (DTC).

A total of 32 TPU input capture/compare match interrupts can be used as DTC activation sources, four each for channels 0, 3, 6, and 9, and two each for channels 1, 2, 4, 5, 7, 8, 10, and 11.

## 11.7 DMAC Activation

In unit 0 of the TPU, the DMAC can be activated by the TGRA input capture/compare match interrupt for a channel. For details, see section 7, DMA Controller (DMAC). (The DMAC cannot be activated by unit 1.)

In unit 0 of the TPU, a total of six TGRA input capture/compare match interrupts can be used as DMAC activation sources, one for each channel.

## 11.8 A/D Converter Activation

The A/D converter can be activated by the TGRA input capture/compare match for a channel.

If the TTGE bit in TIER is set to 1 when the TGFA flag in TSR is set to 1 by the occurrence of a TGRA input capture/compare match on a particular channel, a request to start A/D conversion is sent to the A/D converter. If the TPU conversion start trigger has been selected on the A/D converter side at this time, A/D conversion is started.

In the TPU, a total of 12 TGRA input capture/compare match interrupts can be used as A/D converter conversion start sources, one for each channel.

## 11.9 Operation Timing

### 11.9.1 Input/Output Timing

#### (1) TCNT Count Timing

Figure 11.31 shows TCNT count timing in internal clock operation, and figure 11.32 shows TCNT count timing in external clock operation.

**Figure 11.31 Count Timing in Internal Clock Operation**

**Figure 11.32 Count Timing in External Clock Operation**

## (2) Output Compare Output Timing

A compare match signal is generated in the final state in which TCNT and TGR match (the point at which the count value matched by TCNT is updated). When a compare match signal is generated, the output value set in TIOR is output at the output compare output pin. After a match between TCNT and TGR, the compare match signal is not generated until the (TIOC pin) TCNT input clock is generated.

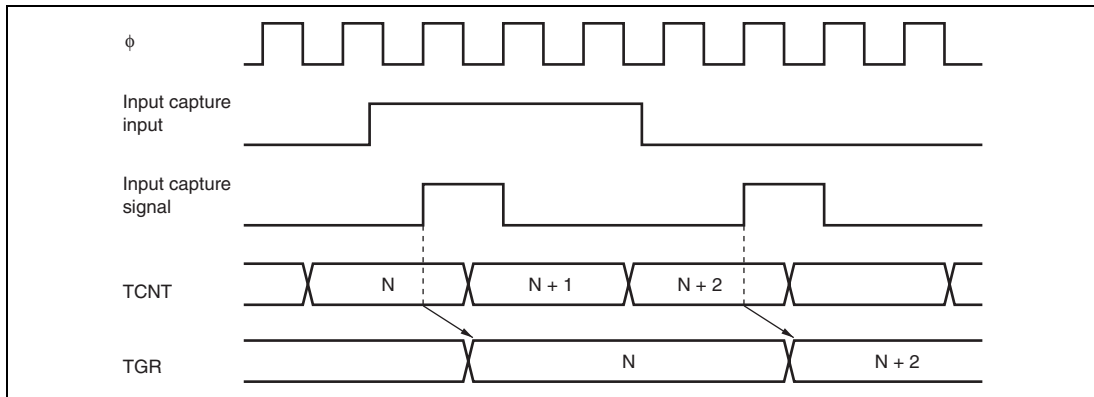

Figure 11.33 shows output compare output timing.

**Figure 11.33 Output Compare Output Timing**

### (3) Input Capture Signal Timing

Figure 11.34 shows input capture signal timing.

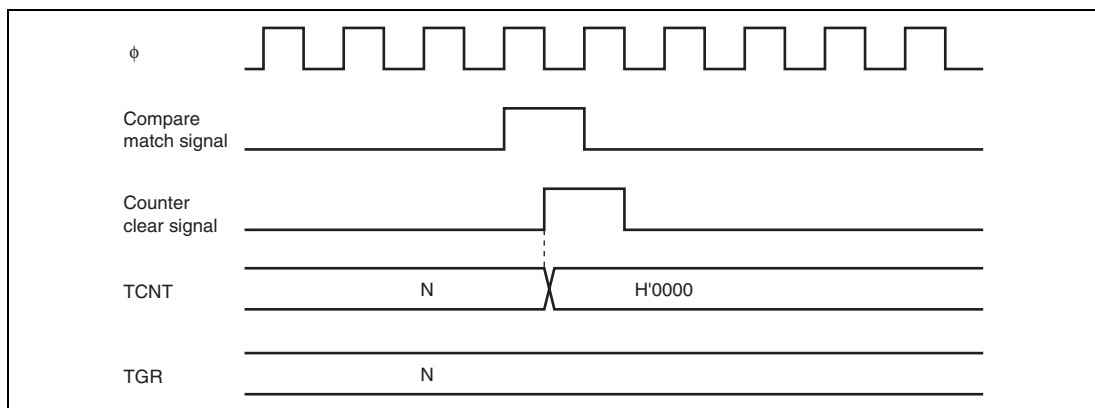

**Figure 11.34 Input Capture Input Signal Timing**

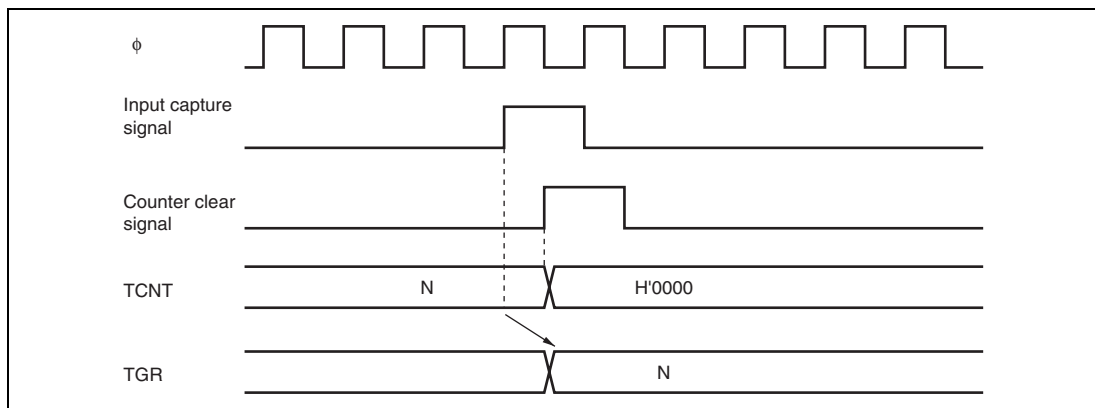

#### (4) Timing for Counter Clearing by Compare Match/Input Capture

Figure 11.35 shows the timing when counter clearing by compare match occurrence is specified, and figure 11.36 shows the timing when counter clearing by input capture occurrence is specified.

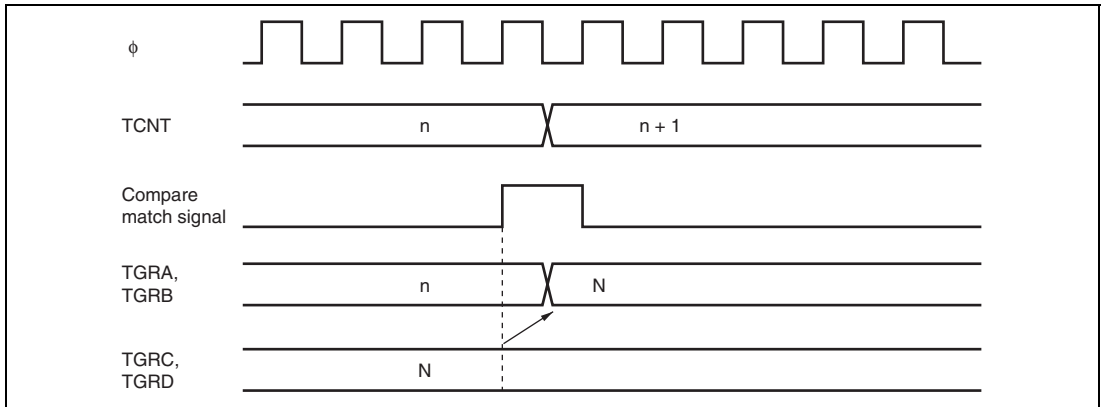

**Figure 11.35 Counter Clear Timing (Compare Match)**

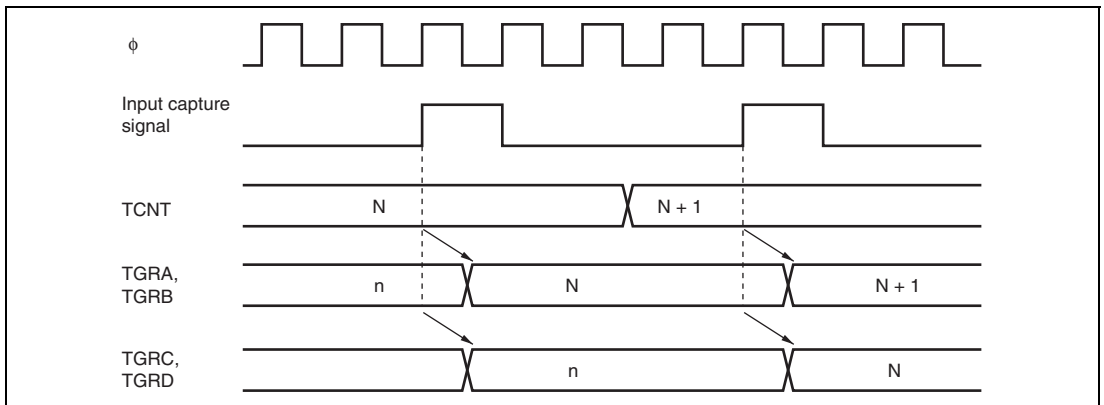

**Figure 11.36 Counter Clear Timing (Input Capture)**

## (5) Buffer Operation Timing

Figures 11.37 and 11.38 show the timings in buffer operation.

**Figure 11.37 Buffer Operation Timing (Compare Match)**

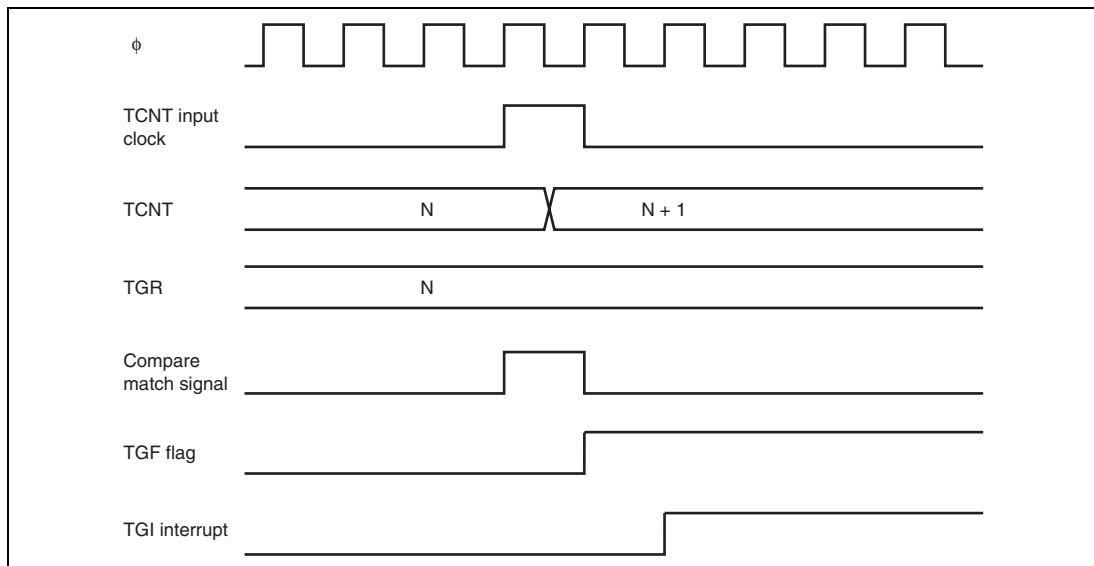

**Figure 11.38 Buffer Operation Timing (Input Capture)**

## 11.9.2 Interrupt Signal Timing

### (1) TGF Flag Setting Timing in Case of Compare Match

Figure 11.39 shows the timing for setting of the TGF flag in TSR by compare match occurrence, and the TGI interrupt request signal timing.

**Figure 11.39 TGI Interrupt Timing (Compare Match)**

## (2) TGF Flag Setting Timing in Case of Input Capture

Figure 11.40 shows the timing for setting of the TGF flag in TSR by input capture occurrence, and the TGI interrupt request signal timing.

**Figure 11.40 TGI Interrupt Timing (Input Capture)**

### (3) TCFV Flag/TCFU Flag Setting Timing

Figure 11.41 shows the timing for setting of the TCFV flag in TSR by overflow occurrence, and the TCIV interrupt request signal timing.

Figure 11.42 shows the timing for setting of the TCFU flag in TSR by underflow occurrence, and the TCIU interrupt request signal timing.

**Figure 11.41 TCIV Interrupt Setting Timing**

**Figure 11.42 TCIU Interrupt Setting Timing**

#### (4) Status Flag Clearing Timing

After a status flag is read as 1 by the CPU, it is cleared by writing 0 to it. When the DTC or DMAC is activated, the flag is cleared automatically. Figure 11.43 shows the timing for status flag clearing by the CPU, and figure 11.44 shows the timing for status flag clearing by the DTC or DMAC.

**Figure 11.43 Timing for Status Flag Clearing by CPU**

**Figure 11.44 Timing for Status Flag Clearing by DTC/DMAC Activation**

## 11.10 Usage Notes

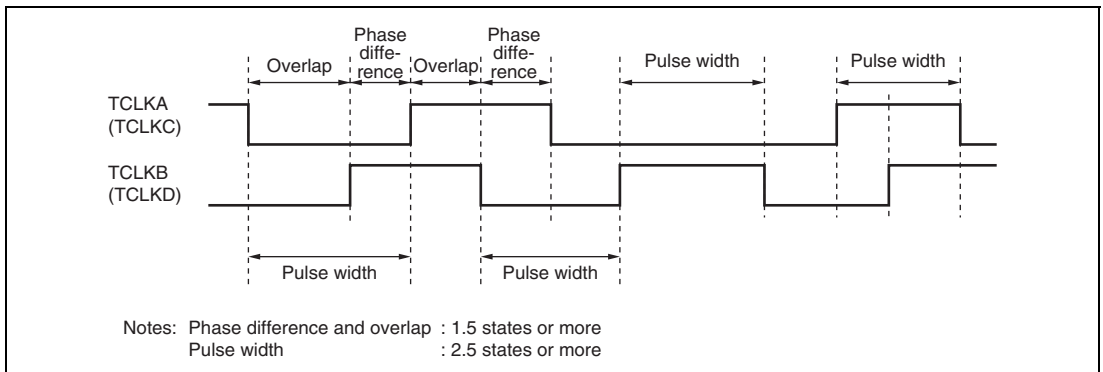

### 11.10.1 Module Stop Function Setting

TPU operation can be disabled or enabled using the module stop control register. The initial setting is for TPU operation to be halted. Register access is enabled by clearing the module stop state. For details, refer to section 23, Power-Down Modes.

### 11.10.2 Input Clock Restrictions

The input clock pulse width must be at least 1.5 states in the case of single-edge detection, and at least 2.5 states in the case of both-edge detection. The TPU will not operate properly with a narrower pulse width.

In phase counting mode, the phase difference and overlap between the two input clocks must be at least 1.5 states, and the pulse width must be at least 2.5 states. Figure 11.45 shows the input clock conditions in phase counting mode.

**Figure 11.45 Phase Difference, Overlap, and Pulse Width in Phase Counting Mode**

### 11.10.3 Caution on Cycle Setting

When counter clearing by compare match is set, TCNT is cleared in the final state in which it matches the TGR value (the point at which the count value matched by TCNT is updated). Consequently, the actual counter frequency is given by the following formula:

$$f = \frac{\phi}{(N + 1)}$$

Where f: Counter frequency  
 $\phi$ : Operating frequency  
 N: TGR set value

### 11.10.4 Contention between TCNT Write and Clear Operations

If the counter clearing signal is generated in the  $T_2$  state of a TCNT write cycle, TCNT clearing takes precedence and the TCNT write is not performed. Figure 11.46 shows the timing in this case.

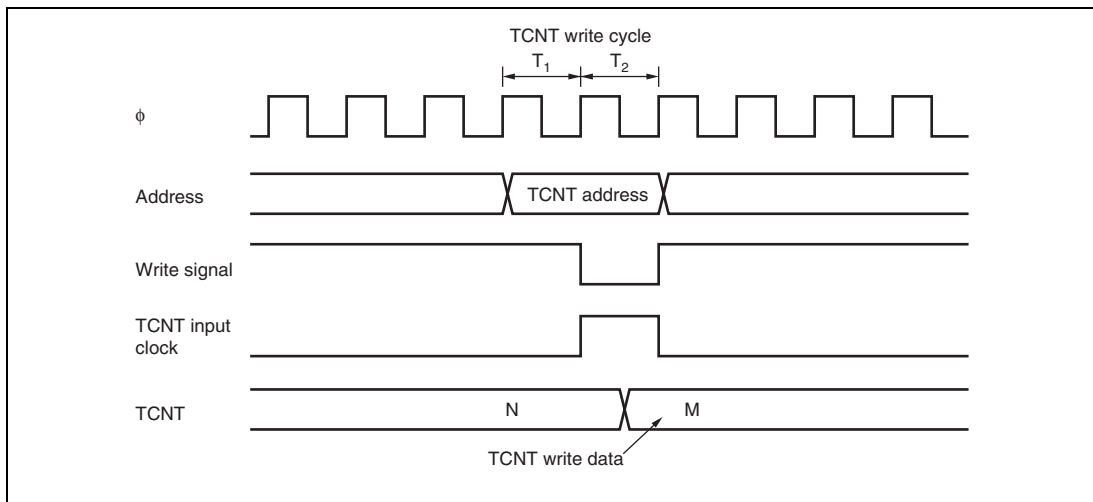

**Figure 11.46 Contention between TCNT Write and Clear Operations**

### 11.10.5 Contention between TCNT Write and Increment Operations

If incrementing occurs in the  $T_2$  state of a TCNT write cycle, the TCNT write takes precedence and TCNT is not incremented. Figure 11.47 shows the timing in this case.

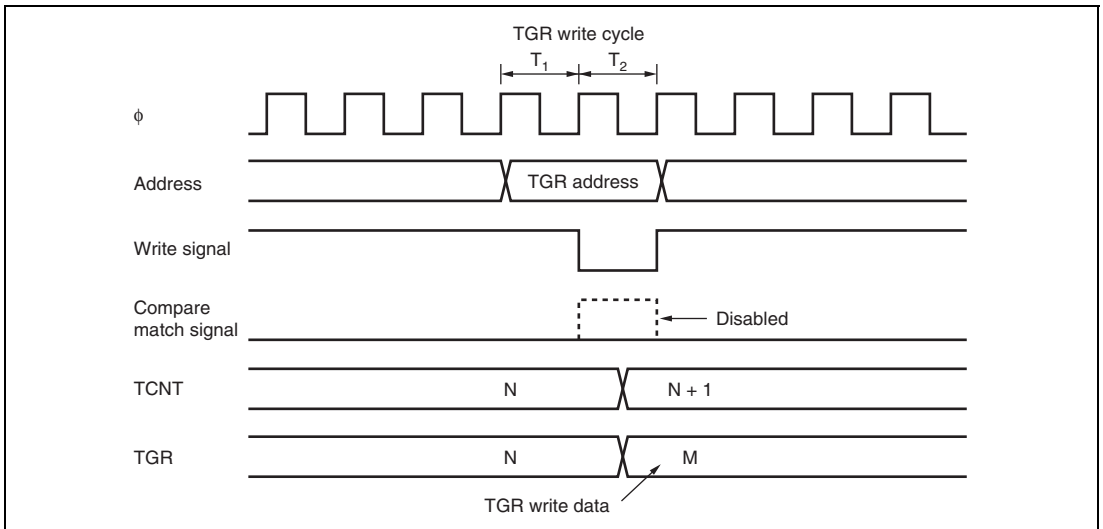

**Figure 11.47** Contention between TCNT Write and Increment Operations

### 11.10.6 Contention between TGR Write and Compare Match

If a compare match occurs in the  $T_2$  state of a TGR write cycle, the TGR write takes precedence and the compare match signal is disabled. A compare match also does not occur when the same value as before is written.

Figure 11.48 shows the timing in this case.

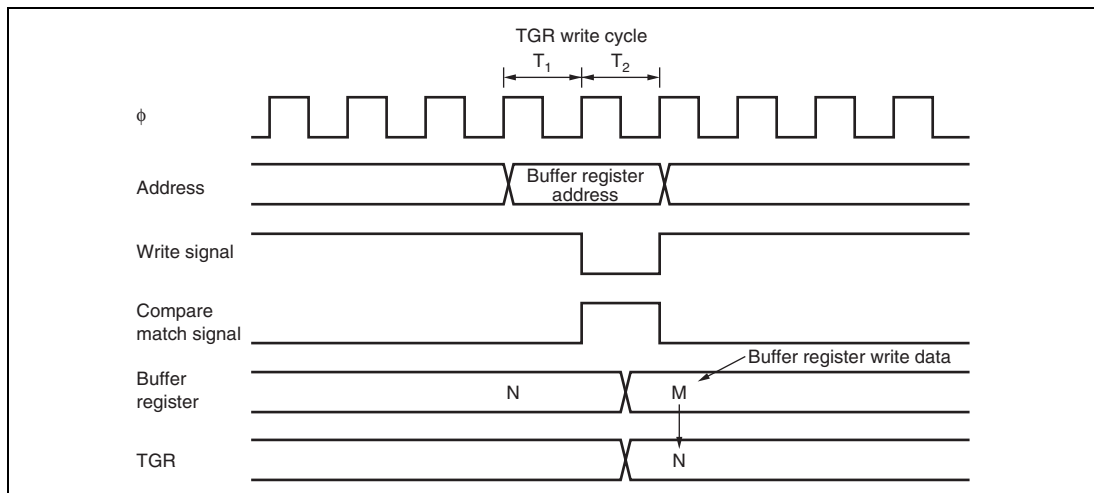

**Figure 11.48 Contention between TGR Write and Compare Match**

### 11.10.7 Contention between Buffer Register Write and Compare Match

If a compare match occurs in the  $T_2$  state of a TGR write cycle, the data transferred to TGR by the buffer operation will be the data prior to the write.

Figure 11.49 shows the timing in this case.

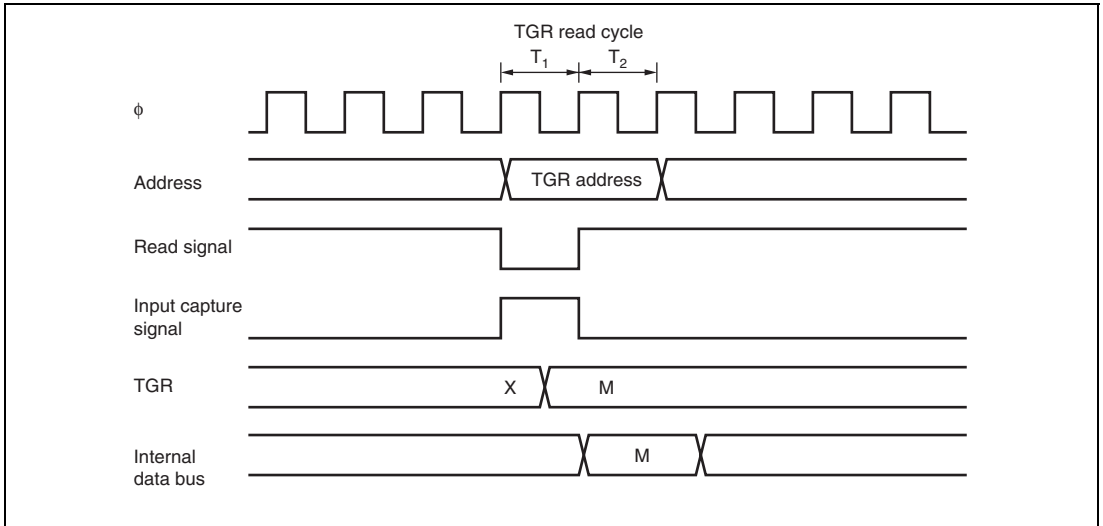

**Figure 11.49 Contention between Buffer Register Write and Compare Match**

### 11.10.8 Contention between TGR Read and Input Capture

If the input capture signal is generated in the  $T_1$  state of a TGR read cycle, the data that is read will be the data after input capture transfer.

Figure 11.50 shows the timing in this case.

**Figure 11.50 Contention between TGR Read and Input Capture**

### 11.10.9 Contention between TGR Write and Input Capture

If the input capture signal is generated in the  $T_2$  state of a TGR write cycle, the input capture operation takes precedence and the write to TGR is not performed.

Figure 11.51 shows the timing in this case.

**Figure 11.51 Contention between TGR Write and Input Capture**

### 11.10.10 Contention between Buffer Register Write and Input Capture

If the input capture signal is generated in the  $T_2$  state of a buffer register write cycle, the buffer operation takes precedence and the write to the buffer register is not performed.

Figure 11.52 shows the timing in this case.

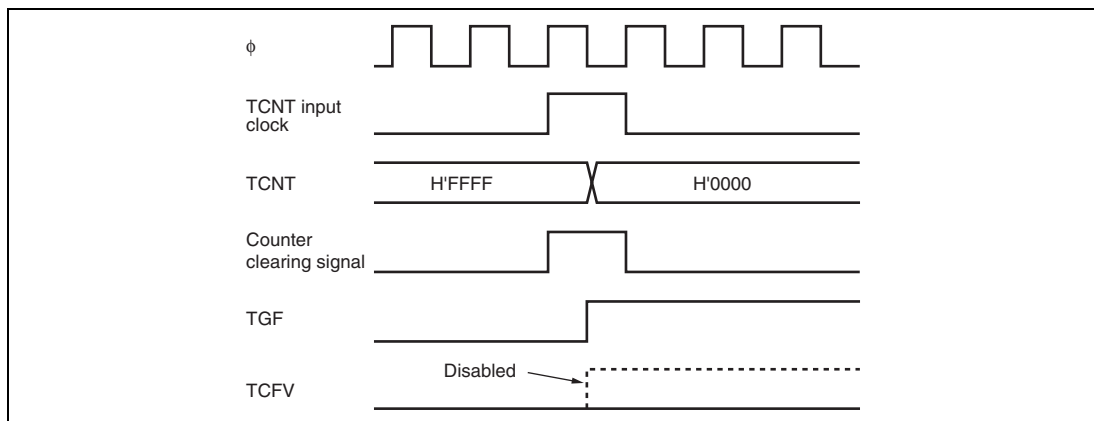

**Figure 11.52 Contention between Buffer Register Write and Input Capture**

### 11.10.11 Contention between Overflow/Underflow and Counter Clearing

If overflow/underflow and counter clearing occur simultaneously, the TCFV/TCFU flag in TSR is not set and TCNT clearing takes precedence.

Figure 11.53 shows the operation timing when a TGR compare match is specified as the clearing source, and H'FFFF is set in TGR.

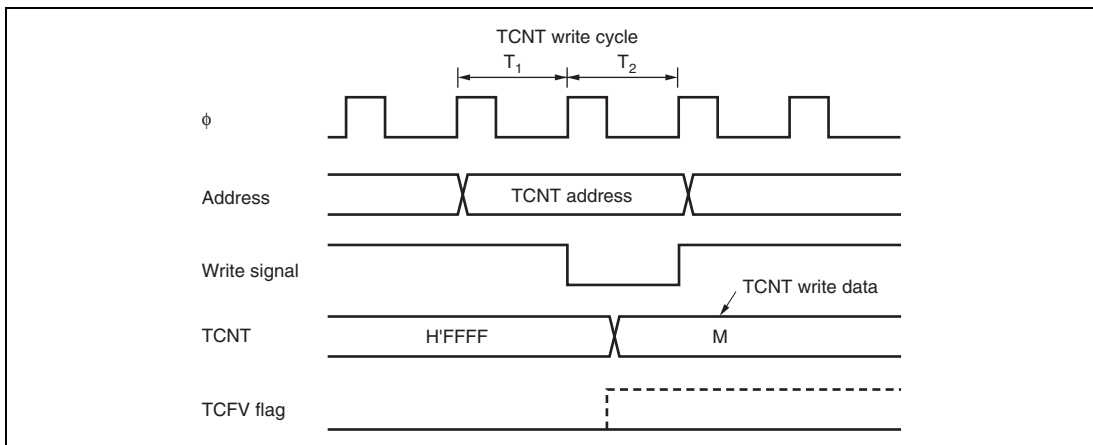

**Figure 11.53 Contention between Overflow and Counter Clearing**

### 11.10.12 Contention between TCNT Write and Overflow/Underflow

If there is an up-count or down-count in the  $T_2$  state of a TCNT write cycle, when overflow/underflow occurs, the TCNT write takes precedence and the TCFV/TCFU flag in TSR is not set.

Figure 11.54 shows the operation timing when there is contention between TCNT write and overflow.

**Figure 11.54 Contention between TCNT Write and Overflow**

### 11.10.13 Multiplexing of I/O Pins

In this LSI, the TCLKA input pin is multiplexed with the TIOCC0 I/O pin, the TCLKB input pin with the TIOCD0 I/O pin, the TCLKC input pin with the TIOCB1 I/O pin, the TCLKD input pin with the TIOCB2 I/O pin, the TCLKE input pin with the TIOCC6 I/O pin, the TCLKF input pin with the TIOCD6 I/O pin, the TCLKG input pin with the TIOCB7 I/O pin, and the TCLKH input pin with the TIOCB8 I/O pin. When an external clock is input, compare match output should not be performed from a multiplexed pin.

### 11.10.14 Interrupts and Module Stop Mode

If a transition is made to the module stop state when an interrupt has been requested, it will not be possible to clear the CPU interrupt source or the DMAC or DTC activation source. Interrupts should therefore be disabled before entering the module stop state.

## Section 12 Programmable Pulse Generator (PPG)

The programmable pulse generator (PPG) provides pulse outputs by using the 16-bit timer pulse unit (TPU) as a time base. The PPG pulse outputs are divided into 4-bit groups (groups 3 to 0) that can operate both simultaneously and independently. The block diagram of PPG is shown in figure 12.1.

### 12.1 Features

- 16-bit output data
- Four output groups
- Selectable output trigger signals
- Non-overlap mode
- Can operate together with the data transfer controller (DTC) and the DMA controller (DMAC).
- Settable inverted output
- Module stop state can be set.

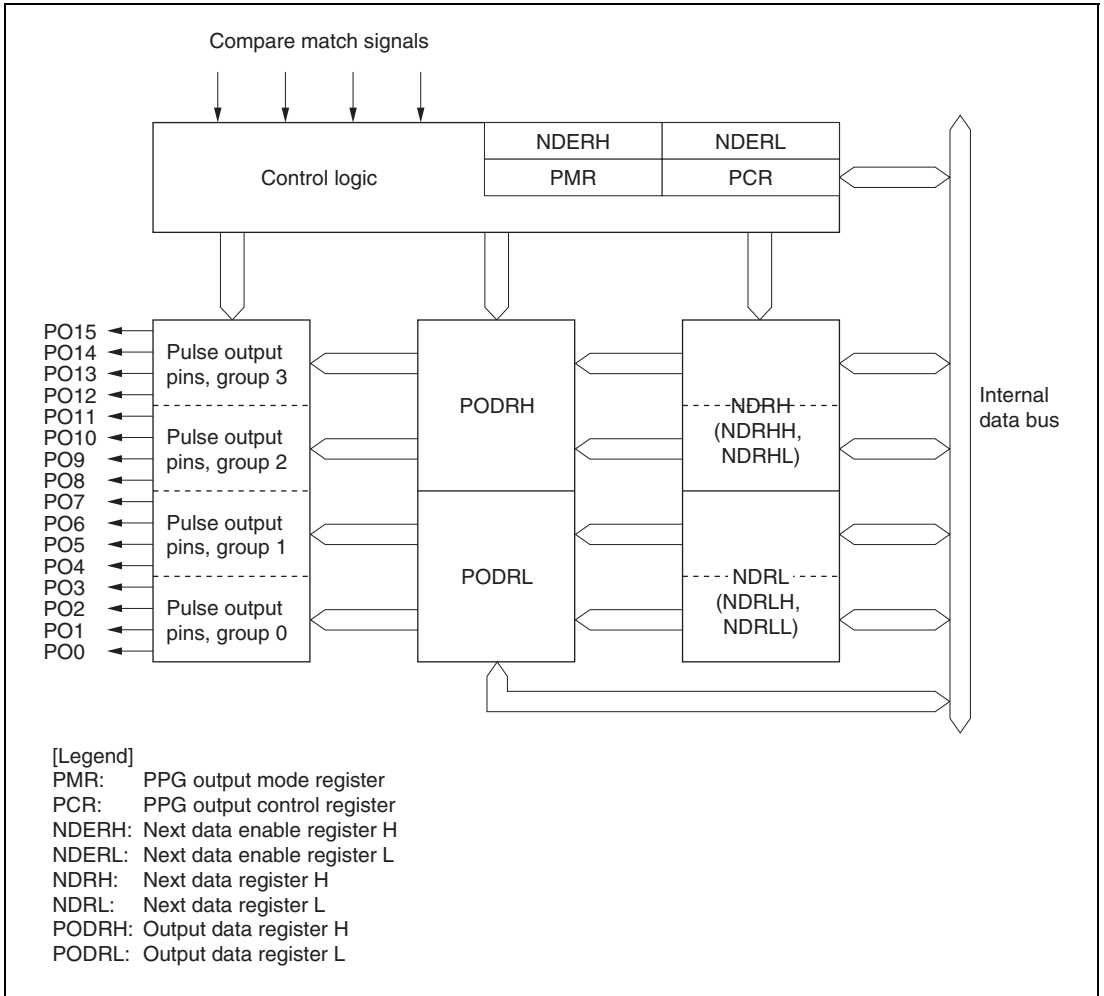

Figure 12.1 Block Diagram of PPG

## 12.2 Input/Output Pins

Table 12.1 shows the PPG pin configuration.

**Table 12.1 Pin Configuration**

| Pin Name | I/O    | Function             |
|----------|--------|----------------------|
| PO15     | Output | Group 3 pulse output |
| PO14     | Output |                      |
| PO13     | Output |                      |
| PO12     | Output |                      |
| PO11     | Output | Group 2 pulse output |
| PO10     | Output |                      |
| PO9      | Output |                      |
| PO8      | Output |                      |
| PO7      | Output | Group 1 pulse output |
| PO6      | Output |                      |
| PO5      | Output |                      |
| PO4      | Output |                      |
| PO3      | Output | Group 0 pulse output |
| PO2      | Output |                      |
| PO1      | Output |                      |
| PO0      | Output |                      |

## 12.3 Register Descriptions

The PPG has the following registers.

- Next data enable register H (NDERH)
- Next data enable register L (NDERL)
- Output data register H (PODRH)
- Output data register L (PODRL)
- Next data register H (NDRH)
- Next data register L (NDRL)
- PPG output control register (PCR)
- PPG output mode register (PMR)

### 12.3.1 Next Data Enable Registers H, L (NDERH, NDERL)

NDERH, NDERL enable or disable pulse output on a bit-by-bit basis. For outputting pulse by the PPG, set the corresponding DDR to 1.

- NDERH

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | NDER15   | 0             | R/W | Next Data Enable 15 to 8  |
| 6   | NDER14   | 0             | R/W | When a bit is set to 1, the value in the corresponding NDRH bit is transferred to the PODRH bit by the selected output trigger. Values are not transferred from NDRH to PODRH for cleared bits. |
| 5   | NDER13   | 0             | R/W |   |
| 4   | NDER12   | 0             | R/W |   |
| 3   | NDER11   | 0             | R/W |   |
| 2   | NDER10   | 0             | R/W |   |
| 1   | NDER9    | 0             | R/W |   |
| 0   | NDER8    | 0             | R/W |   |

- NDERL

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | NDER7    | 0             | R/W | Next Data Enable 7 to 0   |
| 6   | NDER6    | 0             | R/W | When a bit is set to 1, the value in the corresponding NDRL bit is transferred to the PODRL bit by the selected output trigger. Values are not transferred from NDRL to PODRL for cleared bits. |
| 5   | NDER5    | 0             | R/W |   |
| 4   | NDER4    | 0             | R/W |   |
| 3   | NDER3    | 0             | R/W |   |
| 2   | NDER2    | 0             | R/W |   |
| 1   | NDER1    | 0             | R/W |   |
| 0   | NDER0    | 0             | R/W |   |

### 12.3.2 Output Data Registers H, L (PODRH, PODRL)

PODRH and PODRL store output data for use in pulse output. A bit that has been set for pulse output by NDER is read-only and cannot be modified.

- PODRH

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | POD15    | 0             | R/W | Output Data Register 15 to 8   |
| 6   | POD14    | 0             | R/W | For bits which have been set to pulse output by NDERH, the output trigger transfers NDRH values to this register during PPG operation. While NDERH is set to 1, the CPU cannot write to this register. While NDERH is cleared, the initial output value of the pulse can be set. |
| 5   | POD13    | 0             | R/W |  |
| 4   | POD12    | 0             | R/W |  |
| 3   | POD11    | 0             | R/W |  |
| 2   | POD10    | 0             | R/W |  |
| 1   | POD9     | 0             | R/W |  |
| 0   | POD8     | 0             | R/W |  |

- PODRL

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | POD7     | 0             | R/W | Output Data Register 7 to 0  |
| 6   | POD6     | 0             | R/W | For bits which have been set to pulse output by NDERL, the output trigger transfers NDRL values to this register during PPG operation. While NDERL is set to 1, the CPU cannot write to this register. While NDERL is cleared, the initial output value of the pulse can be set. |
| 5   | POD5     | 0             | R/W |  |
| 4   | POD4     | 0             | R/W |  |
| 3   | POD3     | 0             | R/W |  |
| 2   | POD2     | 0             | R/W |  |
| 1   | POD1     | 0             | R/W |  |
| 0   | POD0     | 0             | R/W |  |

### 12.3.3 Next Data Registers H, L (NDRH, NDRL)

NDRH, NDRL store the next data for pulse output. The NDR addresses differ depending on whether pulse output groups have the same output trigger or different output triggers.

- NDRH (NDRHH, NDRHL)\*

If pulse output groups 2 and 3 have the same output trigger, all eight bits are mapped to the same address and can be accessed at one time, as shown below.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | NDR15    | 0             | R/W | Next Data Register 15 to 8  |
| 6   | NDR14    | 0             | R/W | The register contents are transferred to the corresponding PODRH bits by the output trigger specified with PCR. |
| 5   | NDR13    | 0             | R/W |   |
| 4   | NDR12    | 0             | R/W |   |
| 3   | NDR11    | 0             | R/W |   |
| 2   | NDR10    | 0             | R/W |   |
| 1   | NDR9     | 0             | R/W |   |
| 0   | NDR8     | 0             | R/W |   |

If pulse output groups 2 and 3 have different output triggers, upper 4 bits and lower 4 bits are mapped to the different addresses as shown below.

- NDRHH\*

| Bit    | Bit Name | Initial Value | R/W | Description   |
|--------|----------|---------------|-----|---|
| 7      | NDR15    | 0             | R/W | Next Data Register 15 to 12   |
| 6      | NDR14    | 0             | R/W | The register contents are transferred to the corresponding PODRH bits by the output trigger specified with PCR. |
| 5      | NDR13    | 0             | R/W |   |
| 4      | NDR12    | 0             | R/W |   |
| 3 to 0 | —        | All 1         | —   | Reserved<br>1 is always read and write is disabled.   |

- NDRHL\*

| Bit    | Bit Name | Initial Value | R/W | Description   |
|--------|----------|---------------|-----|---|
| 7 to 4 | —        | All 1         | —   | Reserved<br>1 is always read and write is disabled.   |
| 3      | NDR11    | 0             | R/W | Next Data Register 11 to 8  |
| 2      | NDR10    | 0             | R/W | The register contents are transferred to the corresponding PODRH bits by the output trigger specified with PCR. |
| 1      | NDR9     | 0             | R/W |   |
| 0      | NDR8     | 0             | R/W |   |

- NDRL (NDRLH, NDRLL)\*

If pulse output groups 0 and 1 have the same output trigger, all eight bits are mapped to the same address and can be accessed at one time, as shown below.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | NDR7     | 0             | R/W | Next Data Register 7 to 0   |
| 6   | NDR6     | 0             | R/W | The register contents are transferred to the corresponding PODRL bits by the output trigger specified with PCR. |
| 5   | NDR5     | 0             | R/W |   |
| 4   | NDR4     | 0             | R/W |   |
| 3   | NDR3     | 0             | R/W |   |
| 2   | NDR2     | 0             | R/W |   |
| 1   | NDR1     | 0             | R/W |   |
| 0   | NDR0     | 0             | R/W |   |

If pulse output groups 0 and 1 have different output triggers, upper 4 bits and lower 4 bits are mapped to the different addresses as shown below.

### 12.3.4 PPG Output Control Register (PCR)

PCR selects output trigger signals on a group-by-group basis. For details on output trigger selection, refer to section 12.3.5, PPG Output Mode Register (PMR).

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | G3CMS1   | 1             | R/W | Group 3 Compare Match Select 1 and 0   |
| 6   | G3CMS0   | 1             | R/W | Select output trigger of pulse output group 3.<br>00: Compare match in TPU channel 0<br>01: Compare match in TPU channel 1<br>10: Compare match in TPU channel 2<br>11: Compare match in TPU channel 3 |
| 5   | G2CMS1   | 1             | R/W | Group 2 Compare Match Select 1 and 0   |
| 4   | G2CMS0   | 1             | R/W | Select output trigger of pulse output group 2.<br>00: Compare match in TPU channel 0<br>01: Compare match in TPU channel 1<br>10: Compare match in TPU channel 2<br>11: Compare match in TPU channel 3 |
| 3   | G1CMS1   | 1             | R/W | Group 1 Compare Match Select 1 and 0   |
| 2   | G1CMS0   | 1             | R/W | Select output trigger of pulse output group 1.<br>00: Compare match in TPU channel 0<br>01: Compare match in TPU channel 1<br>10: Compare match in TPU channel 2<br>11: Compare match in TPU channel 3 |
| 1   | G0CMS1   | 1             | R/W | Group 0 Compare Match Select 1 and 0   |
| 0   | G0CMS0   | 1             | R/W | Select output trigger of pulse output group 0.<br>00: Compare match in TPU channel 0<br>01: Compare match in TPU channel 1<br>10: Compare match in TPU channel 2<br>11: Compare match in TPU channel 3 |

### 12.3.5 PPG Output Mode Register (PMR)

PMR selects the pulse output mode of the PPG for each group. If inverted output is selected, a low-level pulse is output when PODRH is 1 and a high-level pulse is output when PODRH is 0. If non-overlapping operation is selected, PPG updates its output values at compare match A or B of the TPU that becomes the output trigger. For details, refer to section 12.4.4, Non-Overlapping Pulse Output.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | G3INV    | 1             | R/W | Group 3 Inversion<br>Selects direct output or inverted output for pulse output group 3.<br>0: Inverted output<br>1: Direct output |
| 6   | G2INV    | 1             | R/W | Group 2 Inversion<br>Selects direct output or inverted output for pulse output group 2.<br>0: Inverted output<br>1: Direct output |
| 5   | G1INV    | 1             | R/W | Group 1 Inversion<br>Selects direct output or inverted output for pulse output group 1.<br>0: Inverted output<br>1: Direct output |
| 4   | G0INV    | 1             | R/W | Group 0 Inversion<br>Selects direct output or inverted output for pulse output group 0.<br>0: Inverted output<br>1: Direct output |

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 3   | G3NOV    | 0             | R/W | <p>Group 3 Non-Overlap</p> <p>Selects normal or non-overlapping operation for pulse output group 3.</p> <p>0: Normal operation (output values updated at compare match A in the selected TPU channel)</p> <p>1: Non-overlapping operation (output values updated at compare match A or B in the selected TPU channel)</p> |
| 2   | G2NOV    | 0             | R/W | <p>Group 2 Non-Overlap</p> <p>Selects normal or non-overlapping operation for pulse output group 2.</p> <p>0: Normal operation (output values updated at compare match A in the selected TPU channel)</p> <p>1: Non-overlapping operation (output values updated at compare match A or B in the selected TPU channel)</p> |
| 1   | G1NOV    | 0             | R/W | <p>Group 1 Non-Overlap</p> <p>Selects normal or non-overlapping operation for pulse output group 1.</p> <p>0: Normal operation (output values updated at compare match A in the selected TPU channel)</p> <p>1: Non-overlapping operation (output values updated at compare match A or B in the selected TPU channel)</p> |
| 0   | G0NOV    | 0             | R/W | <p>Group 0 Non-Overlap</p> <p>Selects normal or non-overlapping operation for pulse output group 0.</p> <p>0: Normal operation (output values updated at compare match A in the selected TPU channel)</p> <p>1: Non-overlapping operation (output values updated at compare match A or B in the selected TPU channel)</p> |

## 12.4 Operation

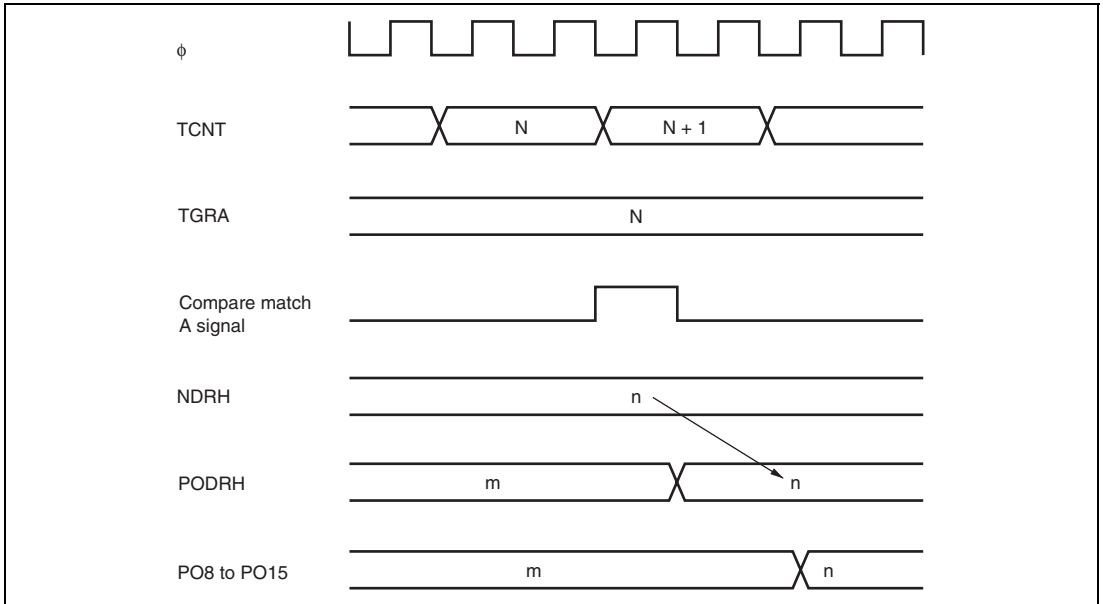

Figure 12.2 shows an overview diagram of the PPG. PPG pulse output is enabled when the corresponding bits in P1DDR, P2DDR, and NDER are set to 1. An initial output value is determined by its corresponding PODR initial setting. When the compare match event specified by PCR occurs, the corresponding NDR bit contents are transferred to PODR to update the output values. Sequential output of data of up to 16 bits is possible by writing new output data to NDR before the next compare match.

**Figure 12.2 Overview Diagram of PPG**

### 12.4.1 Output Timing

If pulse output is enabled, NDR contents are transferred to PODR and output when the specified compare match event occurs. Figure 12.3 shows the timing of these operations for the case of normal output in group 2 and 3, triggered by compare match A.

**Figure 12.3 Timing of Transfer and Output of NDR Contents (Example)**

## 12.4.2 Sample Setup Procedure for Normal Pulse Output

Figure 12.4 shows a sample procedure for setting up normal pulse output.

**Figure 12.4 Setup Procedure for Normal Pulse Output (Example)**

### 12.4.3 Example of Normal Pulse Output (Example of Five-Phase Pulse Output)

Figure 12.5 shows an example in which pulse output is used for cyclic five-phase pulse output.

**Figure 12.5 Normal Pulse Output Example (Five-Phase Pulse Output)**

1. Set up TGRA in TPU which is used as the output trigger to be an output compare register. Set a cycle in TGRA so that the counter will be cleared by compare match A. Set the TGIEA bit in TIER to 1 to enable the compare match/input capture A (TGIA) interrupt.
2. Write H'F8 in P1DDR and NDRH, and set the G3CMS1, G3CMS0, G2CMS1, and G2CMS0 bits in PCR to select compare match in the TPU channel set up in the previous step to be the output trigger. Write output data H'80 in NDRH.
3. The timer counter in the TPU channel starts. When compare match A occurs, the NDRH contents are transferred to PODRH and output. The TGIA interrupt handling routine writes the next output data (H'C0) in NDRH.
4. Five-phase pulse output (one or two phases active at a time) can be obtained subsequently by writing H'40, H'60, H'20, H'30, H'10, H'18, H'08, H'88... at successive TGIA interrupts. If the DTC or DMAC is set for activation by the TGIA interrupt, pulse output can be obtained without imposing a load on the CPU.

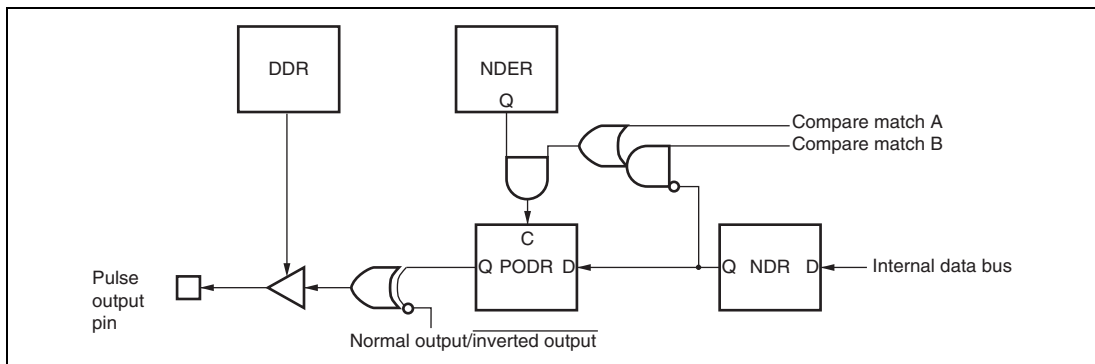

### 12.4.4 Non-Overlapping Pulse Output

During non-overlapping operation, transfer from NDR to PODR is performed as follows:

- NDR bits are always transferred to PODR bits at compare match A.
- At compare match B, NDR bits are transferred only if their value is 0. Bits are not transferred if their value is 1.

Figure 12.6 illustrates the non-overlapping pulse output operation.

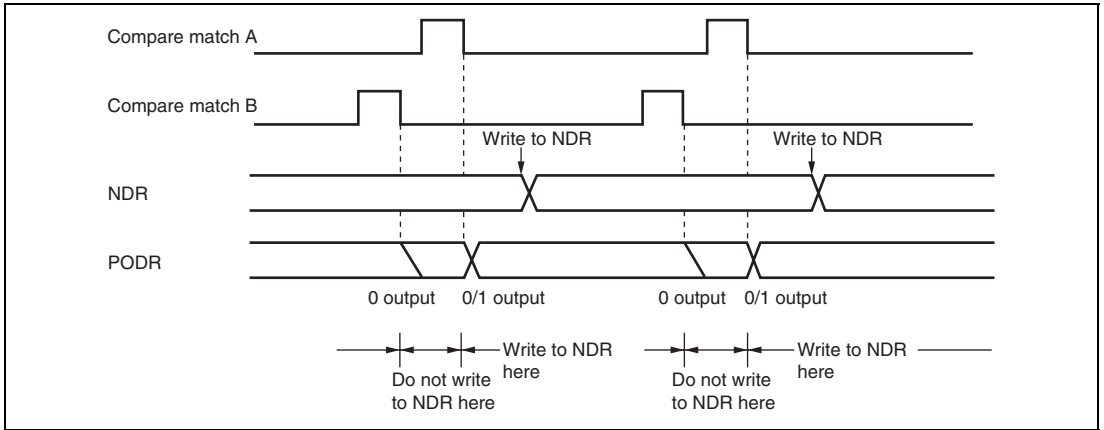

**Figure 12.6 Non-Overlapping Pulse Output**

Therefore, 0 data can be transferred ahead of 1 data by making compare match B occur before compare match A.

The NDR contents should not be altered during the interval from compare match B to compare match A (the non-overlap margin).

This can be accomplished by having the TGIA interrupt handling routine write the next data in NDR, or by having the TGIA interrupt activate the DTC or DMAC. Note, however, that the next data must be written before the next compare match B occurs.

Figure 12.7 shows the timing of this operation.

**Figure 12.7 Non-Overlapping Operation and NDR Write Timing**

## 12.4.5 Sample Setup Procedure for Non-Overlapping Pulse Output

Figure 12.8 shows a sample procedure for setting up non-overlapping pulse output.

[1] Set TIOR to make TGRA and TGRB an output compare registers (with output disabled).

[2] Set the pulse output trigger period in TGRB and the non-overlap period in TGRA.

[3] Select the counter clock source with bits TPSC2 to TPSC0 in TCR. Select the counter clear source with bits CCLR2 to CCLR0.

[4] Enable the TGIA interrupt in TIER. The DTC or DMAC can also be set up to transfer data to NDR.

[5] Set the initial output values in PODR.

[6] Set the DDR and NDER bits for the pins to be used for pulse output to 1.

[7] Select the TPU compare match event to be used as the pulse output trigger in PCR.

[8] In PMR, select the groups that will operate in non-overlap mode.

[9] Set the next pulse output values in NDR.

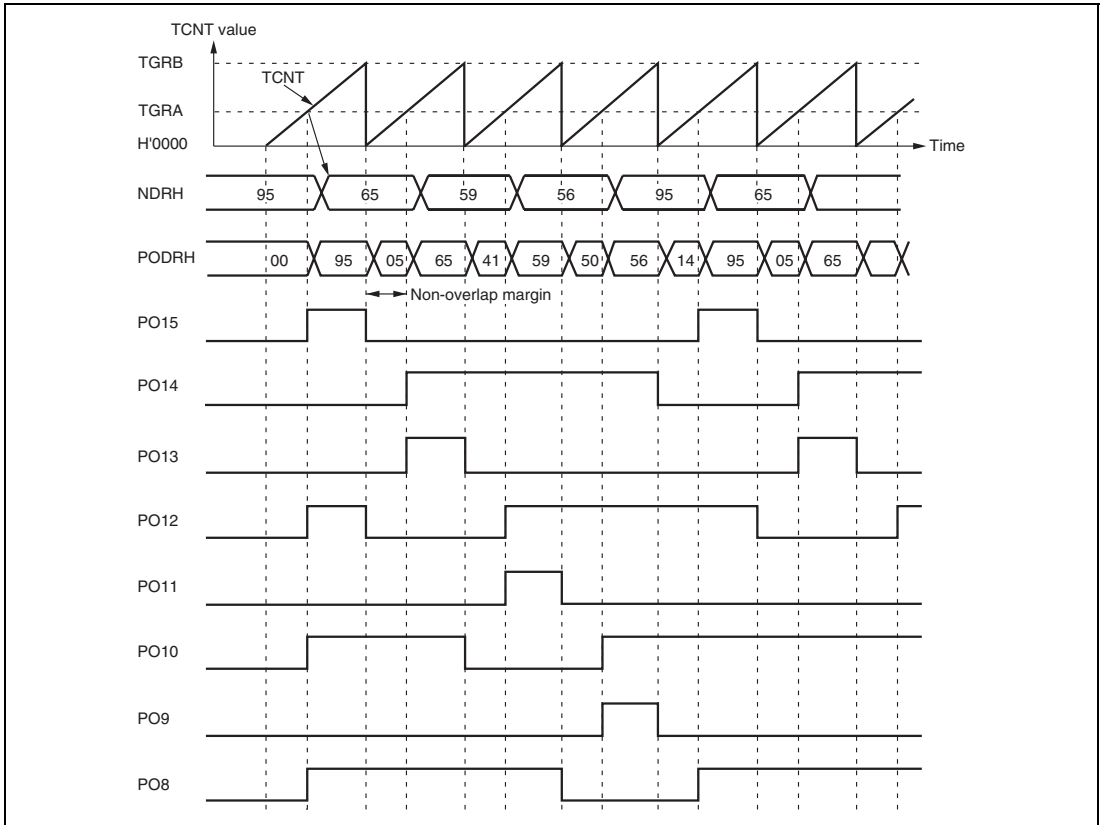

[10] Set the CST bit in TSTR to 1 to start the TCNT counter.

[11] At each TGIA interrupt, set the next output values in NDR.

**Figure 12.8 Setup Procedure for Non-Overlapping Pulse Output (Example)**

### 12.4.6 Example of Non-Overlapping Pulse Output (Example of Four-Phase Complementary Non-Overlapping Output)

Figure 12.9 shows an example in which pulse output is used for four-phase complementary non-overlapping pulse output.

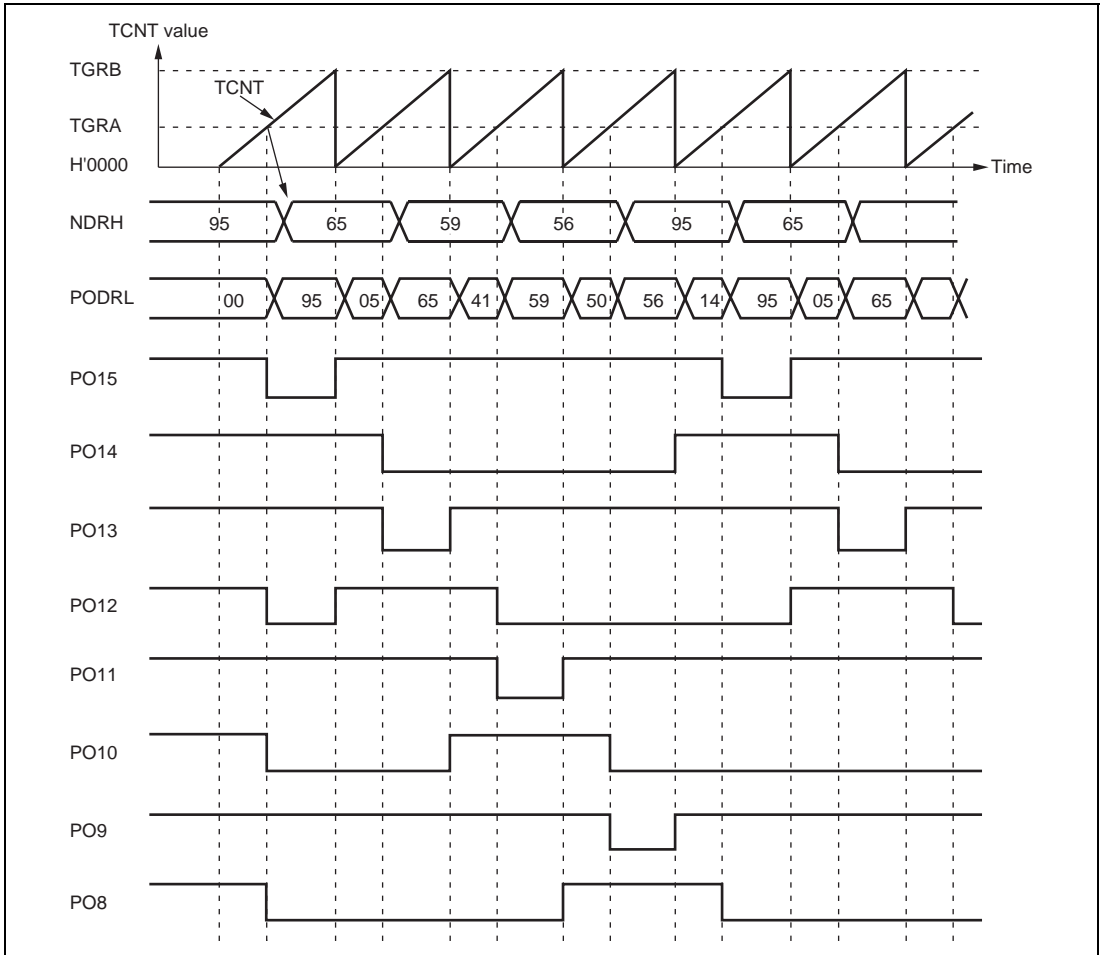

**Figure 12.9 Non-Overlapping Pulse Output Example (Four-Phase Complementary)**

1. Set up the TPU channel to be used as the output trigger channel so that TGRA and TGRB are output compare registers. Set the trigger period in TGRB and the non-overlap margin in TGRA, and set the counter to be cleared by compare match B. Set the TGIEA bit in TIER to 1 to enable the TGIA interrupt.
2. Write H'FF in P1DDR and NDERH, and set the G3CMS1, G3CMS0, G2CMS1, and G2CMS0 bits in PCR to select compare match in the TPU channel set up in the previous step to be the output trigger. Set the G3NOV and G2NOV bits in PMR to 1 to select non-overlapping output. Write output data H'95 in NDRH.
3. The timer counter in the TPU channel starts. When a compare match with TGRB occurs, outputs change from 1 to 0. When a compare match with TGRA occurs, outputs change from 0 to 1 (the change from 0 to 1 is delayed by the value set in TGRA). The TGIA interrupt handling routine writes the next output data (H'65) in NDRH.
4. Four-phase complementary non-overlapping pulse output can be obtained subsequently by writing H'59, H'56, H'95... at successive TGIA interrupts.  
If the DTC or DMAC is set for activation by the TGIA interrupt, pulse output can be obtained without imposing a load on the CPU.

### 12.4.7 Inverted Pulse Output

If the G3INV, G2INV, G1INV, and G0INV bits in PMR are cleared to 0, values that are the inverse of the PODR contents can be output.

Figure 12.10 shows the outputs when G3INV and G2INV are cleared to 0, in addition to the settings of figure 12.9.

**Figure 12.10 Inverted Pulse Output (Example)**

### 12.4.8 Pulse Output Triggered by Input Capture

Pulse output can be triggered by TPU input capture as well as by compare match. If TGRA functions as an input capture register in the TPU channel selected by PCR, pulse output will be triggered by the input capture signal.

Figure 12.11 shows the timing of this output.

**Figure 12.11 Pulse Output Triggered by Input Capture (Example)**

## 12.5 Usage Notes

### 12.5.1 Module Stop Function Setting

PPG operation can be disabled or enabled using the module stop control register. The initial value is for PPG operation to be halted. Register access is enabled by clearing the module stop state. For details, refer to section 23, Power-Down Modes.

### 12.5.2 Operation of Pulse Output Pins

Pins PO0 to PO15 are also used for other peripheral functions such as the TPU. When output by another peripheral function is enabled, the corresponding pins cannot be used for pulse output. Note, however, that data transfer from NDR bits to PODR bits takes place, regardless of the usage of the pins.

Pin functions should be changed only under conditions in which the output trigger event will not occur.

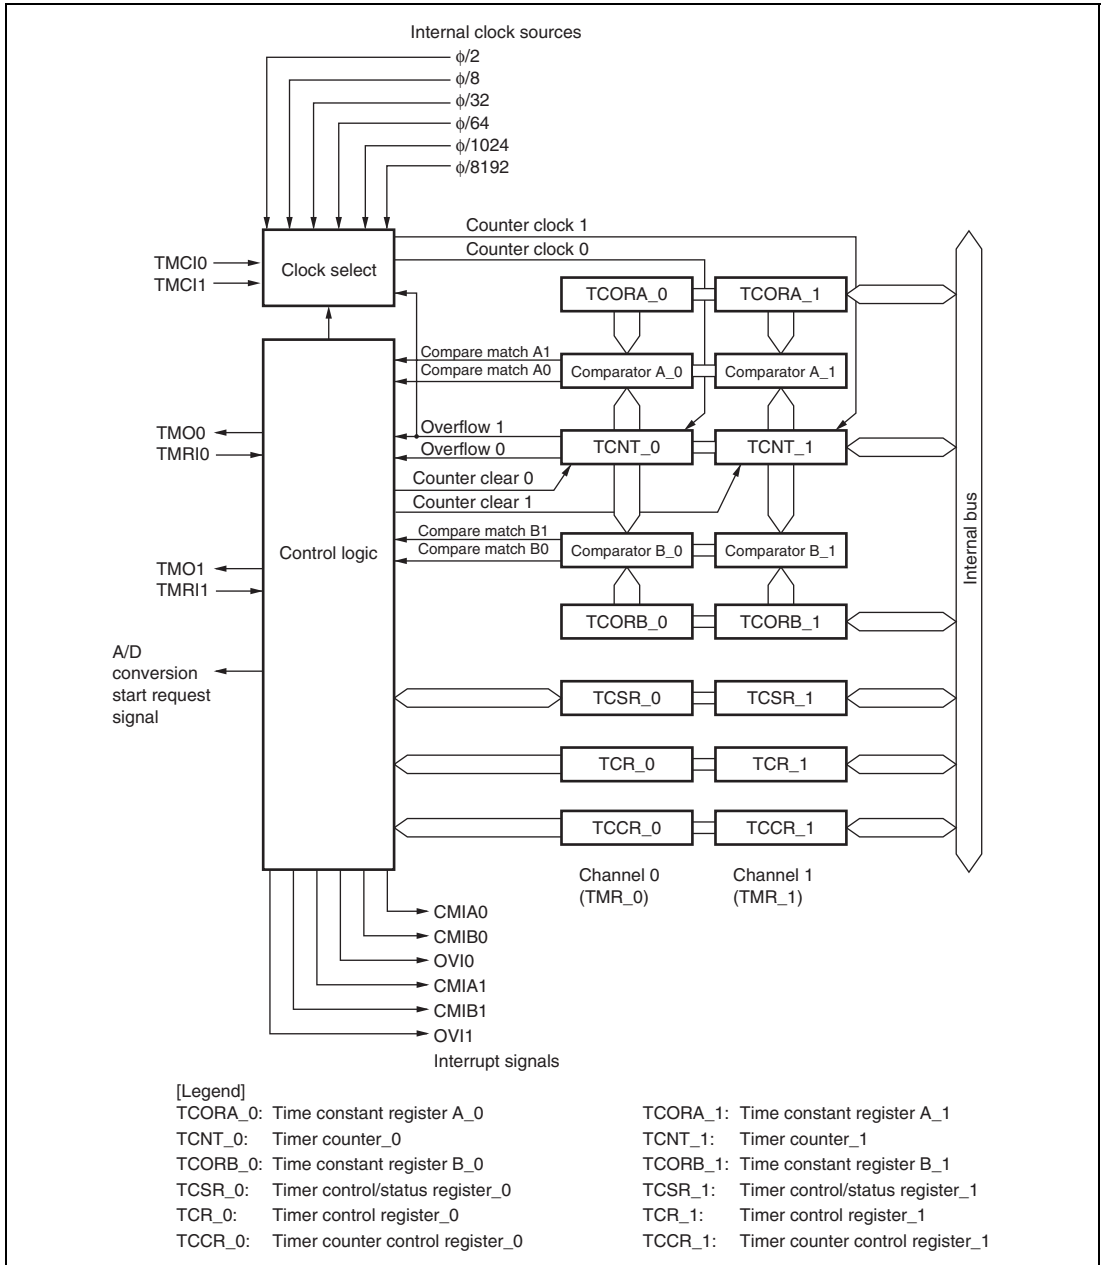

## Section 13 8-Bit Timers (TMR)

This LSI has an on-chip 8-bit timer module with two channels operating on the basis of an 8-bit counter. The 8-bit timer module can be used to count external events and be used as a multifunction timer in a variety of applications, such as generation of counter reset, interrupt requests, and pulse output with an arbitrary duty cycle using a compare-match signal with two registers.

### 13.1 Features

- Selection of seven clock sources  
The counters can be driven by one of six internal clock signals ( $\phi/2$ ,  $\phi/8$ ,  $\phi/32$ ,  $\phi/64$ ,  $\phi/1024$ , or  $\phi/8192$ ) or an external clock input
- Selection of three ways to clear the counters  
The counters can be cleared on compare match A or B, or by an external reset signal (rising edge, rising and falling edges, falling edge, low level, or high level)
- Timer output control by a combination of two compare match signals  
The timer output signal in each channel is controlled by a combination of two independent compare match signals, enabling the timer to generate output waveforms with an arbitrary duty cycle or PWM output
- Provision for cascading of two channels (TMR\_0 and TMR\_1)  
Operation as a 16-bit timer is possible, using TMR\_0 for the upper 8 bits and TMR\_1 for the lower 8 bits (16-bit count mode)  
TMR\_1 can be used to count TMR\_0 compare matches (compare match count mode)
- Three independent interrupts  
Compare match A and B and overflow interrupts can be requested independently
- A/D converter conversion start trigger can be generated

Figure 13.1 shows a block diagram of the 8-bit timer module (TMR\_0 and TMR\_1).

**Figure 13.1 Block Diagram of 8-Bit Timer Module**

## 13.2 Input/Output Pins

Table 13.1 shows the pin configuration of the 8-bit timer module.

**Table 13.1 Pin Configuration**

| Channel | Name                  | Symbol | I/O    | Function                          |
|---------|-----------------------|--------|--------|-----------------------------------|
| 0       | Timer output pin      | TMO0   | Output | Outputs at compare match          |
|         | Timer clock input pin | TMCI0  | Input  | Inputs external clock for counter |
|         | Timer reset input pin | TMRI0  | Input  | Inputs external reset to counter  |
| 1       | Timer output pin      | TMO1   | Output | Outputs at compare match          |
|         | Timer clock input pin | TMCI1  | Input  | Inputs external clock for counter |
|         | Timer reset input pin | TMRI1  | Input  | Inputs external reset to counter  |

## 13.3 Register Descriptions

The 8-bit timer module has the following registers. For details on the module stop control register, refer to section 23.1.2, Module Stop Control Registers H and L (MSTPCRH, MSTPCRL).

- Timer counter\_0 (TCNT\_0)
- Time constant register A\_0 (TCORA\_0)
- Time constant register B\_0 (TCORB\_0)
- Timer control register\_0 (TCR\_0)
- Timer control/status register\_0 (TCSR\_0)
- Timer counter control register\_0 (TCCR\_0)
- Timer counter\_1 (TCNT\_1)
- Time constant register A\_1 (TCORA\_1)
- Time constant register B\_1 (TCORB\_1)
- Timer control register\_1 (TCR\_1)
- Timer control/status register\_1 (TCSR\_1)
- Timer counter control register\_1 (TCCR\_1)

### 13.3.1 Timer Counter (TCNT)

TCNT is 8-bit up-counter. TCNT\_0 and TCNT\_1 comprise a single 16-bit register so they can be accessed together by a word transfer instruction. Bits CKS2 to CKS0 in TCR are used to select a clock. TCNT can be cleared by an external reset input or by a compare match signal A or B. Which signal is to be used for clearing is selected by bits CCLR1 and CCLR0 in TCR. When TCNT overflows from H'FF to H'00, OVF in TCSR is set to 1. TCNT is initialized to H'00.

### 13.3.2 Time Constant Register A (TCORA)

TCORA is 8-bit readable/writable register. TCORA\_0 and TCORA\_1 comprise a single 16-bit register so they can be accessed together by a word transfer instruction. The value in TCORA is continually compared with the value in TCNT. When a match is detected, the corresponding CMFA flag in TCSR is set to 1. Note, however, that comparison is disabled during the  $T_2$  state of a TCORA write cycle. The timer output from the TMO pin can be freely controlled by this compare match signal (compare match A) and the settings of bits OS1 and OS0 in TCSR. TCORA is initialized to H'FF.

### 13.3.3 Time Constant Register B (TCORB)

TCORB is 8-bit readable/writable register. TCORB\_0 and TCORB\_1 comprise a single 16-bit register so they can be accessed together by a word transfer instruction. TCORB is continually compared with the value in TCNT. When a match is detected, the corresponding CMFB flag in TCSR is set to 1. Note, however, that comparison is disabled during the  $T_2$  state of a TCOBR write cycle. The timer output from the TMO pin can be freely controlled by this compare match signal (compare match B) and the settings of bits OS3 and OS2 in TCSR. TCORB is initialized to H'FF.

### 13.3.4 Timer Control Register (TCR)

TCR selects the clock source and the time at which TCNT is cleared, and controls interrupts.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | CMIEB    | 0             | R/W | Compare Match Interrupt Enable B<br>Selects whether CMFB interrupt requests (CMIB) are enabled or disabled when the CMFB flag in TCSR is set to 1.<br>0: CMFB interrupt requests (CMIB) are disabled<br>1: CMFB interrupt requests (CMIB) are enabled |
| 6   | CMIEA    | 0             | R/W | Compare Match Interrupt Enable A<br>Selects whether CMFA interrupt requests (CMIA) are enabled or disabled when the CMFA flag in TCSR is set to 1.<br>0: CMFA interrupt requests (CMIA) are disabled<br>1: CMFA interrupt requests (CMIA) are enabled |
| 5   | OVIE     | 0             | R/W | Timer Overflow Interrupt Enable<br>Selects whether OVF interrupt requests (OVI) are enabled or disabled when the OVF flag in TCSR is set to 1.<br>0: OVF interrupt requests (OVI) are disabled<br>1: OVF interrupt requests (OVI) are enabled         |
| 4   | CCLR1    | 0             | R/W | Counter Clear 1 and 0   |
| 3   | CCLR0    | 0             | R/W | These bits select the method by which TCNT is cleared, in combination with the TMRIS bit in TCCR. See table 13.2.   |
| 2   | CKS2     | 0             | R/W | Clock Select 2 to 0   |
| 1   | CKS1     | 0             | R/W | These bits select the clock input to TCNT and the count condition, in combination with the ICKS1 and ICKS0 bits in TCCR. See table 13.3.  |
| 0   | CKS0     | 0             | R/W |   |

### 13.3.5 Timer Counter Control Register (TCCR)

TCCR selects the TCNT internal clock source and controls the external reset input.

| Bit    | Bit Name | Initial Value | R/W | Description  |
|--------|----------|---------------|-----|--|
| 7 to 4 | —        | All 0         | R   | Reserved<br>These bits are always read as 0 and cannot be modified.  |
| 3      | TMRIS    | 0             | R/W | Timer Reset Input Select<br>Selects the external reset input, in combination with the CCLR1 and CCLR0 bits in TCR. See table 13.2. |
| 2      | —        | 0             | R   | Reserved<br>This bit is always read as 0 and cannot be modified.   |
| 1      | ICKS1    | 0             | R/W | Internal Clock Select 1, 0   |
| 0      | ICKS0    | 0             | R/W | These bits select the internal clock source, in combination with the CKS2 to CKS0 bits in TCR. See table 13.3.                     |

**Table 13.2 Reset Input to TCNT and Clearing Condition**

| TCR            |                | TCCR           | Description  |
|----------------|----------------|----------------|--|
| Bit 1<br>CCLR1 | Bit 0<br>CCLR0 | Bit 3<br>TMRIS |  |
| 0              | 0              | 0              | Clearing is disabled   |
| 0              | 1              | 0              | Clear by compare match A                                       |
| 1              | 0              | 0              | Clear by compare match B                                       |
| 1              | 1              | 0              | Clear by rising edge of external reset input                   |
| 0              | 0              | 1              | Clear by both rising and falling edges of external reset input |
| 0              | 1              | 1              | Clear by falling edge of external reset input                  |
| 1              | 0              | 1              | Clear by low level of external reset input                     |
| 1              | 1              | 1              | Clear by high level of external reset input                    |

**Table 13.3 Clock Input to TCNT and Count Condition**

| Channel | TCR           |               |               | TCCR           |                | Description  |  |
|---------|---------------|---------------|---------------|----------------|----------------|--|--|
|         | Bit 2<br>CKS2 | Bit 1<br>CKS1 | Bit 0<br>CKS0 | Bit 1<br>ICKS1 | Bit 0<br>ICKS0 |  |  |
| TMR_0   | 0             | 0             | 0             | —              | —              | Clock input disabled                                   |  |
|         | 0             | 0             | 1             | 0              | 0              | Internal clock, counted at rising edge of $\phi/8$     |  |

| 4   | —        | 1             | R      | Reserved<br>This bit is always read as 1 and cannot be modified.  |

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 3   | OS3      | 0             | R/W | Output Select 3 and 2   |
| 2   | OS2      | 0             | R/W | <p>These bits select a method of TMO pin output when compare match B of TCORB and TCNT occurs.</p> <p>00: No change when compare match B occurs</p> <p>01: 0 is output when compare match B occurs</p> <p>10: 1 is output when compare match B occurs</p> <p>11: Output is inverted when compare match B occurs (toggle output)</p> |
| 1   | OS1      | 0             | R/W | Output Select 1 and 0   |
| 0   | OS0      | 0             | R/W | <p>These bits select a method of TMO pin output when compare match A of TCORA and TCNT occurs.</p> <p>00: No change when compare match A occurs</p> <p>01: 0 is output when compare match A occurs</p> <p>10: 1 is output when compare match A occurs</p> <p>11: Output is inverted when compare match A occurs (toggle output)</p> |

Note: \* Only 0 can be written to, to clear these flags.

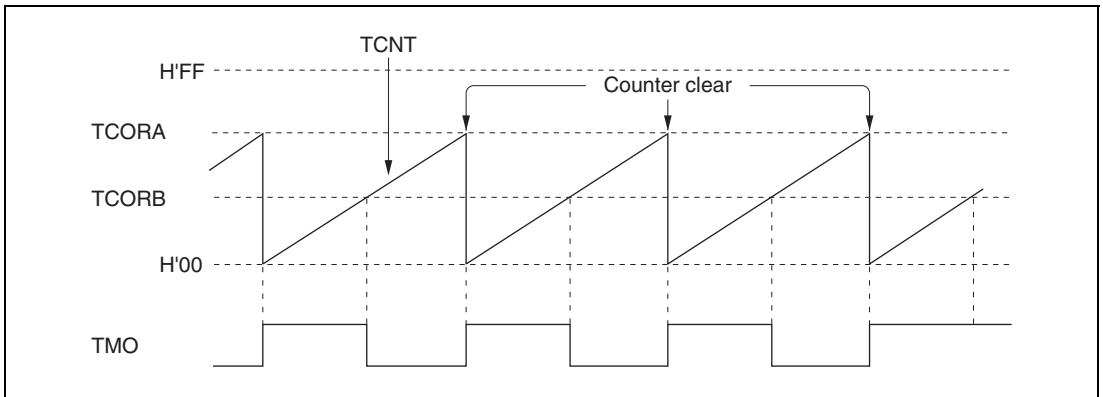

## 13.4 Operation

### 13.4.1 Pulse Output

Figure 13.2 shows an example in which the 8-bit timer is used to generate a pulse output with a selected duty cycle. The control bits are set as follows:

- [1] In TCR, the CCLR1 bit is cleared to 0 and the CCLR0 bit is set to 1 so that TCNT is cleared at a TCORA compare match.
- [2] In TCSR, the OS3 to OS0 bits are set to B'0110, causing the output to change to 1 at a TCORA compare match and to 0 at a TCORB compare match.

With these settings, the 8-bit timer provides output of pulses at a rate determined by TCORA with a pulse width determined by TCORB. No software intervention is required.

**Figure 13.2 Example of Pulse Output**

### 13.4.2 Reset Input

Figure 13.3 shows an example in which the 8-bit timer is used to generate a pulse output with a selected delay in response to the TMRI input. The control bits are set as follows:

- [1] The CCLR0 bit in TCR is set to 1 and the TMRIS bit in TCCR is set to 1 so that TCNT is cleared at the high level of the TMRI input.
- [2] In TCSR, bits OS3 to OS0 are set to B'0110, causing the output to change to 1 at a TCORA compare match and to 0 at a TCORB compare match.

With these settings, the 8-bit timer provides output of pulses whose delay from the TMRI input is determined by TCORA and the pulse width determined by  $(TCORB - TCORA)$ .

**Figure 13.3 Example of Reset Input**

## 13.5 Operation Timing

### 13.5.1 TCNT Incrementation Timing

Figure 13.4 shows the count timing for internal clock input. Figure 13.5 shows the count timing for external clock signal. Note that the external clock pulse width must be at least 1.5 states for incrementation at a single edge, and at least 2.5 states for incrementation at both edges. The counter will not increment correctly if the pulse width is less than these values.

**Figure 13.4 Count Timing for Internal Clock Input**

**Figure 13.5 Count Timing for External Clock Input**

### 13.5.2 Timing of CMFA and CMFB Setting when Compare-Match Occurs

The CMFA and CMFB flags in TCSR are set to 1 by a compare match signal generated when the TCOR and TCNT values match. The compare match signal is generated at the last state in which the match is true, just before the timer counter is updated. Therefore, when TCOR and TCNT match, the compare match signal is not generated until the next incrementation clock input. Figure 13.6 shows this timing.

**Figure 13.6** Timing of CMF Setting

### 13.5.3 Timing of Timer Output when Compare-Match Occurs

When compare match A or B occurs, the timer output changes as specified by bits OS3 to OS0 in TCSR. Figure 13.7 shows the timing when the output is set to toggle at compare match A.

**Figure 13.7 Timing of Timer Output**

### 13.5.4 Timing of Compare Match Clear

TCNT is cleared when compare match A or B occurs, depending on the settings of the CCLR1 and CCLR0 bits in TCR and the TMRIS bit in TCCR. Figure 13.8 shows the timing of this operation.

**Figure 13.8 Timing of Compare Match Clear**

### 13.5.5 Timing of TCNT External Reset

TCNT is cleared at the rising edge, falling edge, low level, or high level of an external reset input, depending on the settings of the CCLR1 and CCLR0 bits in TCR and the TMRIS bit in TCCR. The clear pulse width must be at least 1.5 states for a single edge and at least 2.5 states for both edges. Figure 13.9 shows the timing of this operation.

**Figure 13.9 Timing of Clearance by External Reset**

### 13.5.6 Timing of Overflow Flag (OVF) Setting

The OVF in TCSR is set to 1 when TCNT overflows (changes from H'FF to H'00). Figure 13.10 shows the timing of this operation.

**Figure 13.10 Timing of OVF Setting**

## 13.6 Operation with Cascaded Connection

If bits CKS2 to CKS0 in either TCR\_0 or TCR\_1 are set to B'100, the 8-bit timers of the two channels are cascaded. With this configuration, a single 16-bit timer could be used (16-bit counter mode) or compare matches of the 8-bit channel 0 could be counted by the timer of channel 1 (compare match count mode). In this case, the timer operates as below.

### 13.6.1 16-Bit Counter Mode

When bits CKS2 to CKS0 in TCR\_0 are set to B'100, the timer functions as a single 16-bit timer with channel 0 occupying the upper 8 bits and channel 1 occupying the lower 8 bits.

#### [1] Setting of compare match flags

- The CMF flag in TCSR\_0 is set to 1 when a 16-bit compare match event occurs.
- The CMF flag in TCSR\_1 is set to 1 when a lower 8-bit compare match event occurs.

#### [2] Counter clear specification

- If the CCLR1 and CCLR0 bits in TCR\_0 have been set for counter clear at compare match, the 16-bit counters (TCNT\_0 and TCNT\_1 together) are cleared when a 16-bit compare match event occurs. The 16-bit counters (TCNT0 and TCNT1 together) are cleared even if counter clear by the TMRI0 pin has also been set.
- The settings of the CCLR1 and CCLR0 bits in TCR\_1 are ignored. The lower 8 bits cannot be cleared independently.

#### [3] Pin output

- Control of output from the TMO0 pin by bits OS3 to OS0 in TCSR\_0 is in accordance with the 16-bit compare match conditions.
- Control of output from the TMO1 pin by bits OS3 to OS0 in TCSR\_1 is in accordance with the lower 8-bit compare match conditions.

### 13.6.2 Compare Match Count Mode

When bits CKS2 to CKS0 in TCR\_1 are B'100, TCNT\_1 counts compare match A's for channel 0. Channels 0 and 1 are controlled independently. Conditions such as setting of the CMF flag, generation of interrupts, output from the TMO pin, and counter clear are in accordance with the settings for each channel.

## 13.7 Interrupt Sources

### 13.7.1 Interrupt Sources and DTC Activation

There are three 8-bit timer interrupt sources: CMIA, CMIB, and OVI. Their relative priorities are shown in table 13.4. Each interrupt source is set as enabled or disabled by the corresponding interrupt enable bit in TCR or TCSR, and independent interrupt requests are sent for each to the interrupt controller. It is also possible to activate the DTC by means of CMIA and CMIB interrupts.

**Table 13.4 8-Bit Timer Interrupt Sources**

| Name  | Interrupt Source      | Interrupt Flag | DTC Activation | Priority  |
|-------|-----------------------|----------------|----------------|-----------|
| CMIA0 | TCORA_0 compare match | CMFA           | Possible       | High      |
| CMIB0 | TCORB_0 compare match | CMFB           | Possible       | ↑<br>High |
| OVI0  | TCNT_0 overflow       | OVF            | Not possible   | Low       |
| CMIA1 | TCORA_1 compare match | CMFA           | Possible       | High      |
| CMIB1 | TCORB_1 compare match | CMFB           | Possible       | ↑<br>High |
| OVI1  | TCNT_1 overflow       | OVF            | Not possible   | Low       |

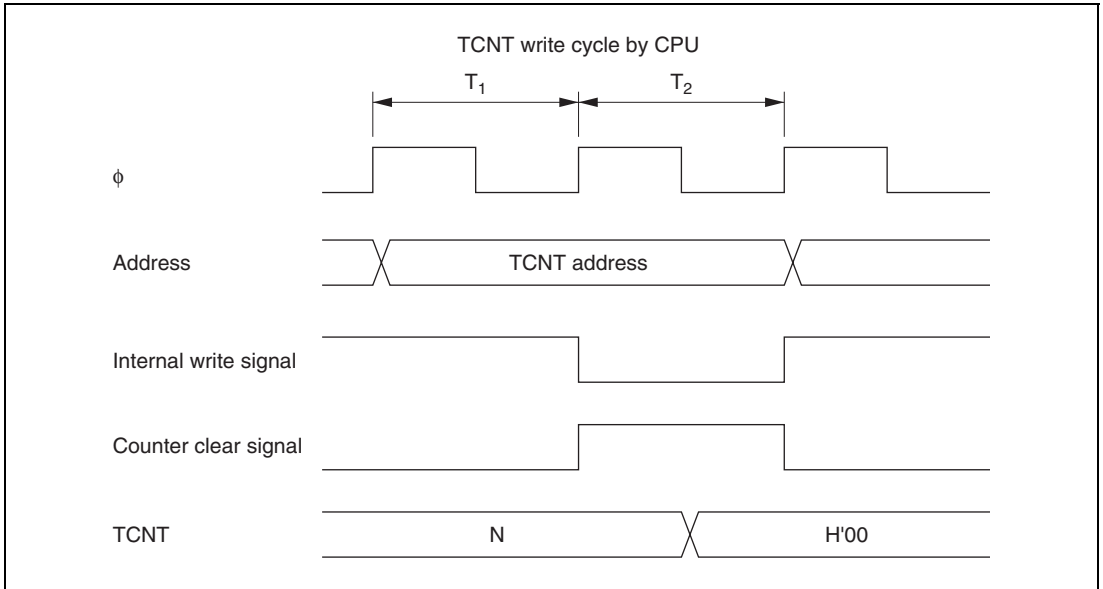

### 13.7.2 A/D Converter Activation

The A/D converter can be activated only by TMR\_0 compare match A. If the ADTE bit in TCSR0 is set to 1 when the CMFA flag is set to 1 by the occurrence of TMR\_0 compare match A, a request to start A/D conversion is sent to the A/D converter. If the 8-bit timer conversion start trigger has been selected on the A/D converter side at this time, A/D conversion is started.

## 13.8 Usage Notes

### 13.8.1 Contention between TCNT Write and Clear

If a timer counter clock pulse is generated during the  $T_2$  state of a TCNT write cycle, the clear takes priority, so that the counter is cleared and the write is not performed. Figure 13.11 shows this operation.

**Figure 13.11 Contention between TCNT Write and Clear**

### 13.8.2 Contention between TCNT Write and Increment

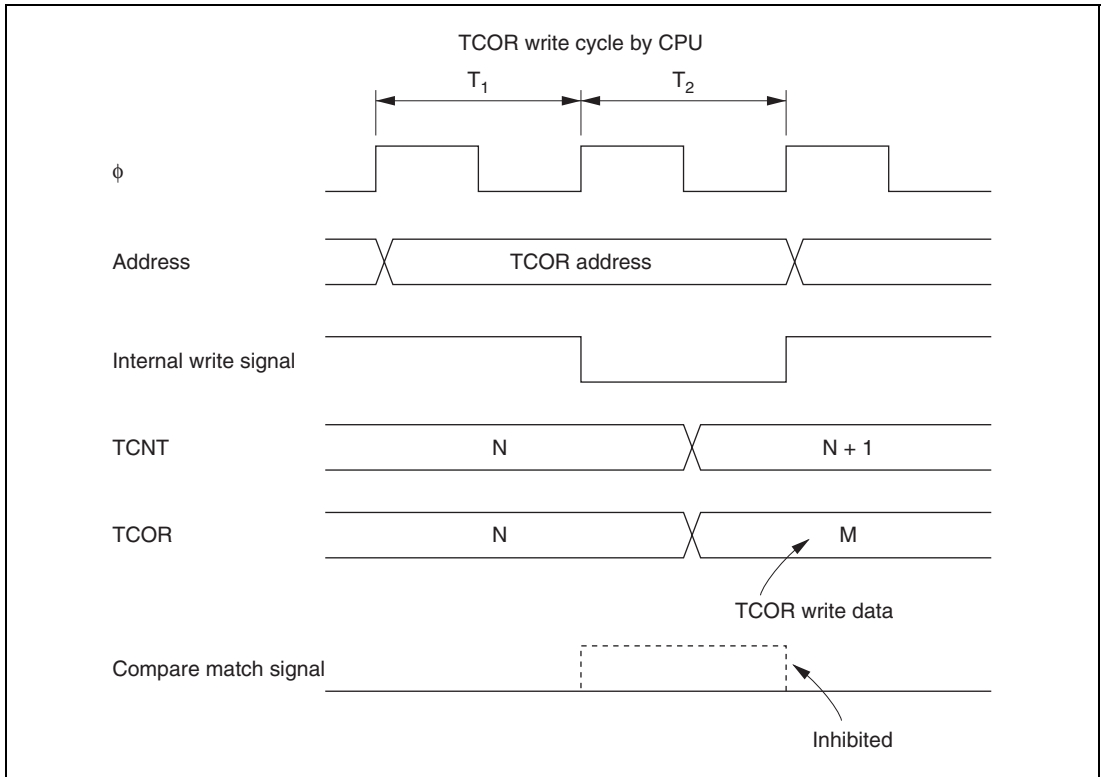

If a timer counter clock pulse is generated during the  $T_2$  state of a TCNT write cycle, the write takes priority and the counter is not incremented. Figure 13.12 shows this operation.

**Figure 13.12 Contention between TCNT Write and Increment**

### 13.8.3 Contention between TCOR Write and Compare Match

During the  $T_2$  state of a TCOR write cycle, the TCOR write has priority and the compare match signal is inhibited even if a compare match event occurs as shown in figure 13.13.

**Figure 13.13 Contention between TCOR Write and Compare Match**

### 13.8.4 Contention between Compare Matches A and B

If compare match events A and B occur at the same time, the 8-bit timer operates in accordance with the priorities for the output statuses set for compare match A and compare match B, as shown in table 13.5.

**Table 13.5 Timer Output Priorities**

| Output Setting | Priority |
|----------------|----------|
| Toggle output  | High     |
| 1 output       | ↑        |
| 0 output       |          |
| No change      | Low      |

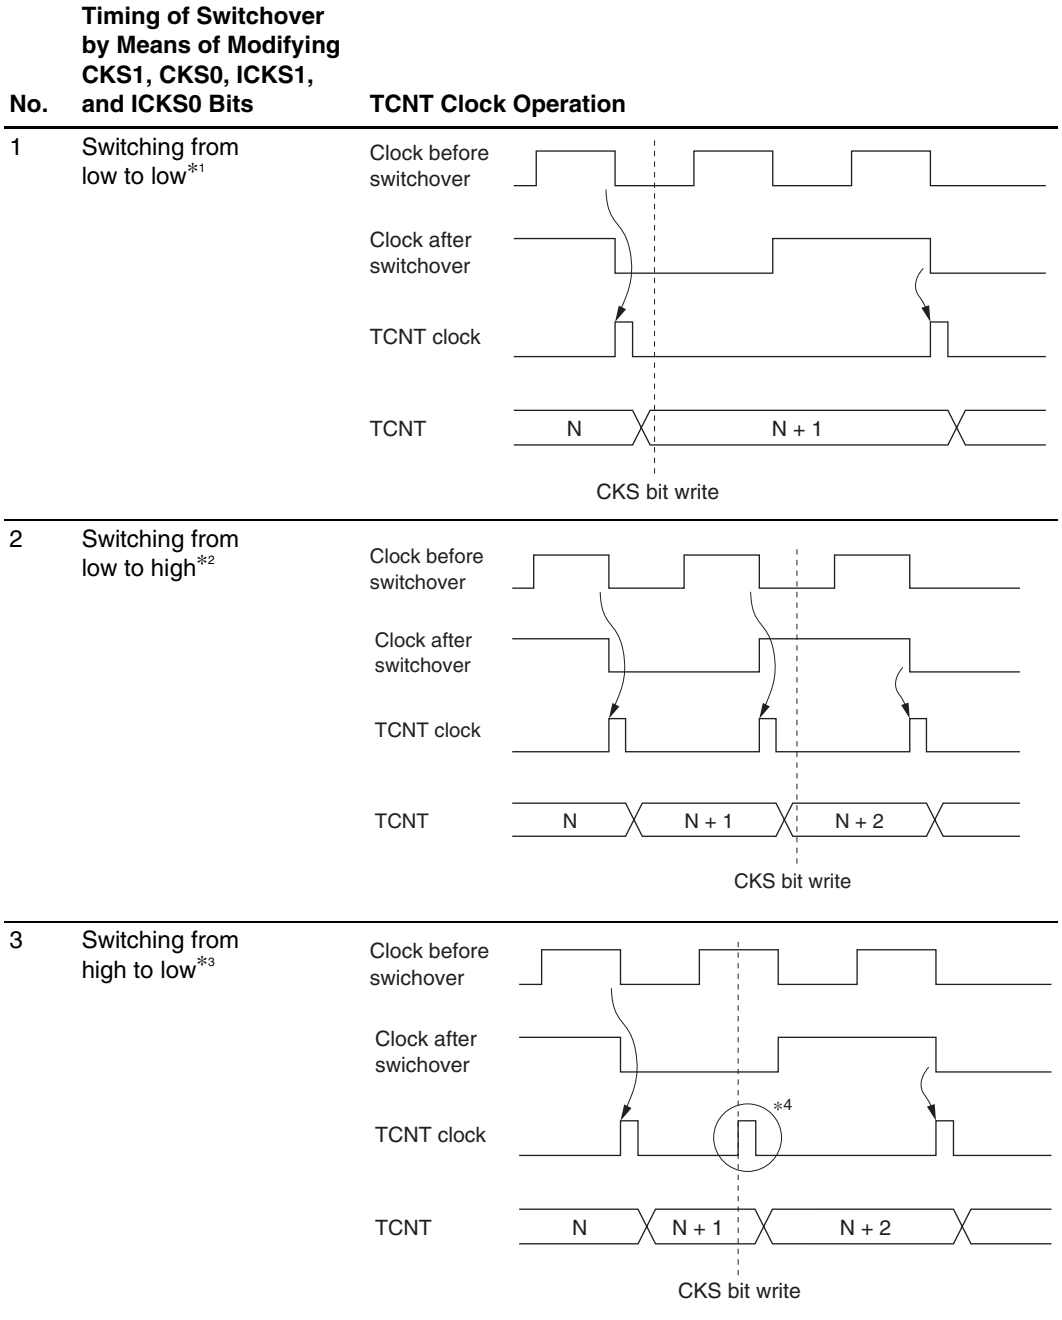

### 13.8.5 Switching of Internal Clocks and TCNT Operation

TCNT may increment erroneously when the internal clock is switched over. Table 13.6 shows the relationship between the timing at which the internal clock is switched (by writing to CKS1, CKS0, ICKS1, and ICKS0 bits) and the TCNT operation.

When the TCNT clock is generated from an internal clock, the rising edge or falling edge of the internal clock pulse is detected. Therefore, when the falling edge is selected, if clock switching causes a change from high to low level, as shown in case 3 in table 13.6, a TCNT clock pulse is generated and the TCNT incremented on the assumption that the switchover is a falling edge. This is the same as when the rising edge is selected.

The erroneous incrementation can also happen when switching between the rising edge and falling edge of an internal clock or switching between internal and external clocks.

**Table 13.6 Switching of Internal Clock and TCNT Operation**

### Timing of Switchover by Means of Modifying CKS1, CKS0, ICKS1, and ICKS0 Bits

- Notes:
1. Includes switching from low to stop, and from stop to low.
  2. Includes switching from stop to high.
  3. Includes switching from high to stop.
  4. Generated on the assumption that the switchover is a falling edge; TCNT is incremented.

### 13.8.6 Mode Setting with Cascaded Connection

If 16-bit counter mode and compare match count mode are specified at the same time, input clocks for TCNT\_0 and TCNT\_1 are not generated, and the counter stops. Do not specify 16-bit counter and compare match count modes simultaneously.

### 13.8.7 Module Stop Function Setting

Operation of the TMR can be disabled or enabled using the module stop control register. The initial setting is for operation of the TMR to be halted. Register access is enabled by clearing the module stop state. For details, refer to section 23, Power-Down Modes.

### 13.8.8 Interrupts in Module Stop State

If a transition is made to the module stop state when an interrupt has been requested, it will not be possible to clear the CPU interrupt source or the DTC and DMAC activation source. Interrupts should therefore be disabled before entering the module stop state.

## Section 14 Watchdog Timer (WDT)

The watchdog timer (WDT) is an 8-bit timer that outputs an overflow signal ( $\overline{\text{WDTOVF}}$ ) if a system crash prevents the CPU from writing to the timer counter, thus allowing it to overflow. At the same time, the WDT can also generate an internal reset signal.

When this watchdog function is not needed, the WDT can be used as an interval timer. In interval timer operation, an interval timer interrupt is generated each time the counter overflows.

The block diagram of the WDT is shown in figure 14.1.

### 14.1 Features

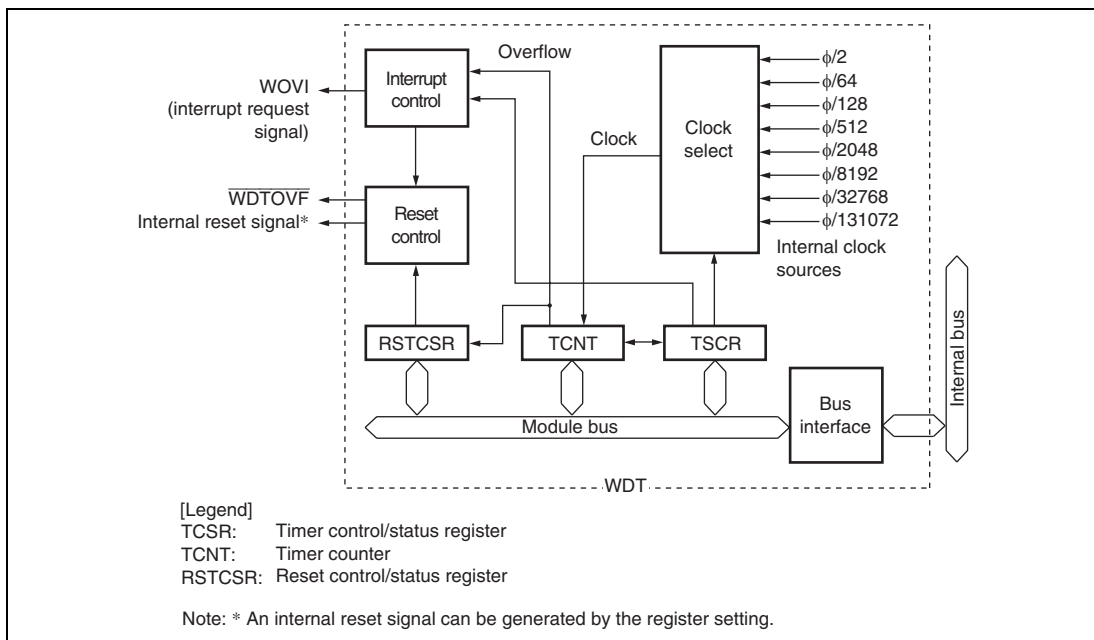

- Selectable from eight counter input clocks
- Switchable between watchdog timer mode and interval timer mode

#### Watchdog Timer Mode

- If the counter overflows, the WDT outputs  $\overline{\text{WDTOVF}}$ . It is possible to select whether or not the entire chip is reset at the same time.

#### Interval Timer Mode

- If the counter overflows, the WDT generates an interval timer interrupt (WOVI).

**Figure 14.1 Block Diagram of WDT**

## 14.2 Input/Output Pin

Table 14.1 shows the WDT pin configuration.

**Table 14.1 Pin Configuration**

| Name                    | Symbol                     | I/O    | Function   |
|-------------------------|----------------------------|--------|--|
| Watchdog timer overflow | $\overline{\text{WDTOVF}}$ | Output | Outputs counter overflow signal in watchdog timer mode |

## 14.3 Register Descriptions

The WDT has the following three registers. To prevent accidental overwriting, TCSR, TCNT, and RSTCSR have to be written to in a method different from normal registers. For details, refer to section 14.6.1, Notes on Register Access.

- Timer counter (TCNT)
- Timer control/status register (TCSR)
- Reset control/status register (RSTCSR)

### 14.3.1 Timer Counter (TCNT)

TCNT is an 8-bit readable/writable up-counter. TCNT is initialized to H'00 when the TME bit in TCSR is cleared to 0.

### 14.3.2 Timer Control/Status Register (TCSR)

TCSR selects the clock source to be input to TCNT, and the timer mode.

| Bit | Bit Name | Initial Value | R/W    | Description  |
|-----|----------|---------------|--------|--|
| 7   | OVF      | 0             | R/(W)* | <p>Overflow Flag</p> <p>Indicates that TCNT has overflowed in interval timer mode. Only a write of 0 is permitted, to clear the flag.</p> <p>[Setting condition]</p> <p>When TCNT overflows in interval timer mode (changes from H'FF to H'00)</p> <p>When internal reset request generation is selected in watchdog timer mode, OVF is cleared automatically by the internal reset.</p> <p>[Clearing conditions]</p> <p>Cleared by reading TCSR when OVF = 1, then writing 0 to OVF</p> |

| Bit  | Bit Name | Initial Value | R/W | Description  |
|------|----------|---------------|-----|--|
| 6    | WT/IT    | 0             | R/W | <p>Timer Mode Select</p> <p>Selects whether the WDT is used as a watchdog timer or interval timer.</p> <p>0: Interval timer mode</p> <p>When TCNT overflows, an interval timer interrupt (WOVI) is requested.</p> <p>1: Watchdog timer mode</p> <p>When TCNT overflows, the <math>\overline{\text{WDTOVF}}</math> signal is output.</p>  |
| 5    | TME      | 0             | R/W | <p>Timer Enable</p> <p>When this bit is set to 1, TCNT starts counting. When this bit is cleared, TCNT stops counting and is initialized to H'00.</p>  |
| 4, 3 | —        | All 1         | —   | <p>Reserved</p> <p>These bits are always read as 1 and cannot be modified.</p>   |
| 2    | CKS2     | 0             | R/W | Clock Select 2 to 0  |
| 1    | CKS1     | 0             | R/W | <p>Selects the clock source to be input to TCNT. The overflow frequency for <math>\phi = 20</math> MHz is enclosed in parentheses.</p> <p>000: Clock <math>\phi/2</math> (frequency: 25.6 <math>\mu\text{s}</math>)</p> <p>001: Clock <math>\phi/64</math> (frequency: 819.2 <math>\mu\text{s}</math>)</p> <p>010: Clock <math>\phi/128</math> (frequency: 1.6 ms)</p> <p>011: Clock <math>\phi/512</math> (frequency: 6.6 ms)</p> <p>100: Clock <math>\phi/2048</math> (frequency: 26.2 ms)</p> <p>101: Clock <math>\phi/8192</math> (frequency: 104.9 ms)</p> <p>110: Clock <math>\phi/32768</math> (frequency: 419.4 ms)</p> <p>111: Clock <math>\phi/131072</math> (frequency: 1.68 s)</p> |
| 0    | CKS0     | 0             | R/W |  |

Note: \* Only a write of 0 is permitted, to clear the flag.

### 14.3.3 Reset Control/Status Register (RSTCSR)

RSTCSR controls the generation of the internal reset signal when TCNT overflows, and selects the type of internal reset signal. RSTCSR is initialized to H'1F by a reset signal from the  $\overline{\text{RES}}$  pin, but not by the WDT internal reset signal caused by overflows.

| Bit    | Bit Name | Initial Value | R/W    | Description  |
|--------|----------|---------------|--------|--|
| 7      | WOVF     | 0             | R/(W)* | <p>Watchdog Timer Overflow Flag</p> <p>This bit is set when TCNT overflows in watchdog timer mode. This bit cannot be set in interval timer mode, and only 0 can be written.</p> <p>[Setting condition]<br/>Set when TCNT overflows (changed from H'FF to H'00) in watchdog timer mode</p> <p>[Clearing condition]<br/>Cleared by reading RSTCSR when WOVF = 1, and then writing 0 to WOVF</p> |
| 6      | RSTE     | 0             | R/W    | <p>Reset Enable</p> <p>Specifies whether or not a reset signal is generated in the chip if TCNT overflows during watchdog timer operation.</p> <p>0: Reset signal is not generated even if TCNT overflows<br/>(Though this LSI is not reset, TCNT and TCSR in WDT are reset)</p> <p>1: Reset signal is generated if TCNT overflows</p>   |
| 5      | —        | 0             | R/W    | <p>Reserved</p> <p>Can be read and written, but does not affect operation.</p>   |
| 4 to 0 | —        | All 1         | —      | <p>Reserved</p> <p>These bits are always read as 1 and cannot be modified.</p>   |

Note: \* Only a write of 0 is permitted, to clear the flag.

## 14.4 Operation

### 14.4.1 Watchdog Timer Mode

To use the WDT as a watchdog timer mode, set the  $\overline{WT/IT}$  and TME bits in TCSR to 1.

If TCNT overflows without being rewritten because of a system crash or other error, the  $\overline{WDTOVF}$  signal is output.

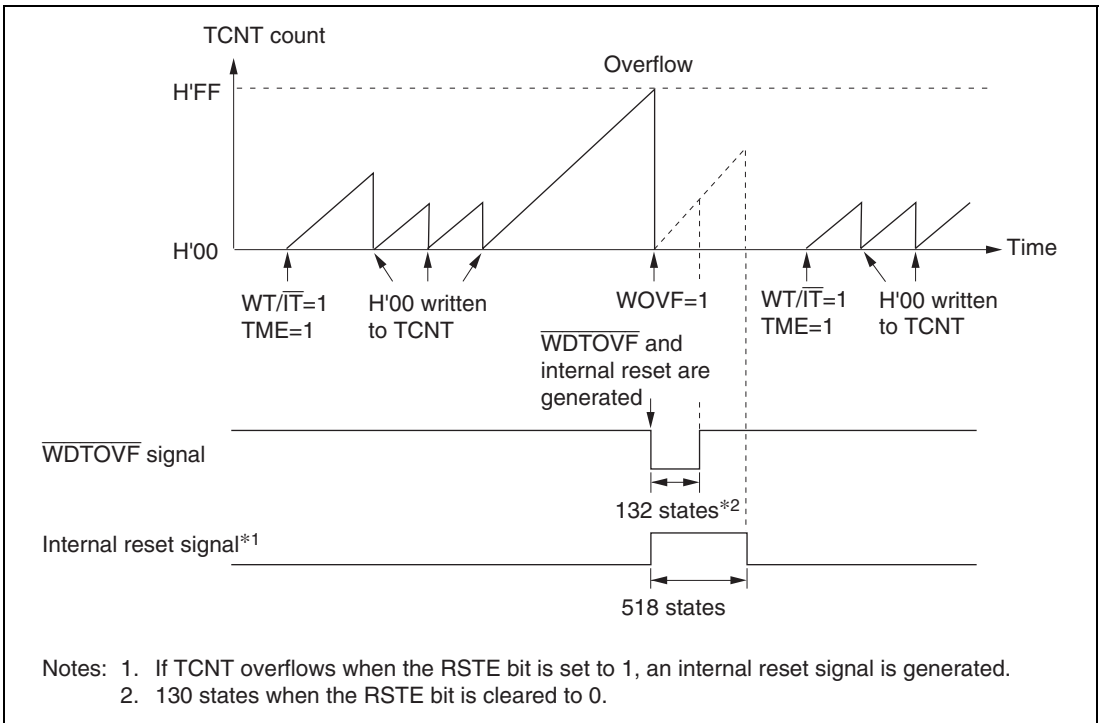

This ensures that TCNT does not overflow while the system is operating normally. Software must prevent TCNT overflows by rewriting the TCNT value (normally by writing H'00) before overflow occurs. This  $\overline{WDTOVF}$  signal can be used to reset the chip internally in watchdog timer mode.

If TCNT overflows when 1 is set in the RSTE bit in RSTCSR, a signal that resets this LSI internally is generated at the same time as the  $\overline{WDTOVF}$  signal. If a reset caused by a signal input to the  $\overline{RES}$  pin occurs at the same time as a reset caused by a WDT overflow, the  $\overline{RES}$  pin reset has priority and the WOVF bit in RSTCSR is cleared to 0.

The  $\overline{WDTOVF}$  signal is output for 132 states when RSTE = 1, and for 130 states when RSTE = 0. The internal reset signal is output for 518 states.

When TCNT overflows in watchdog timer mode, the WOVF bit in RSTCSR is set to 1. If TCNT overflows when 1 is set in the RSTE bit in RSTCSR, an internal reset signal is generated to the entire chip.

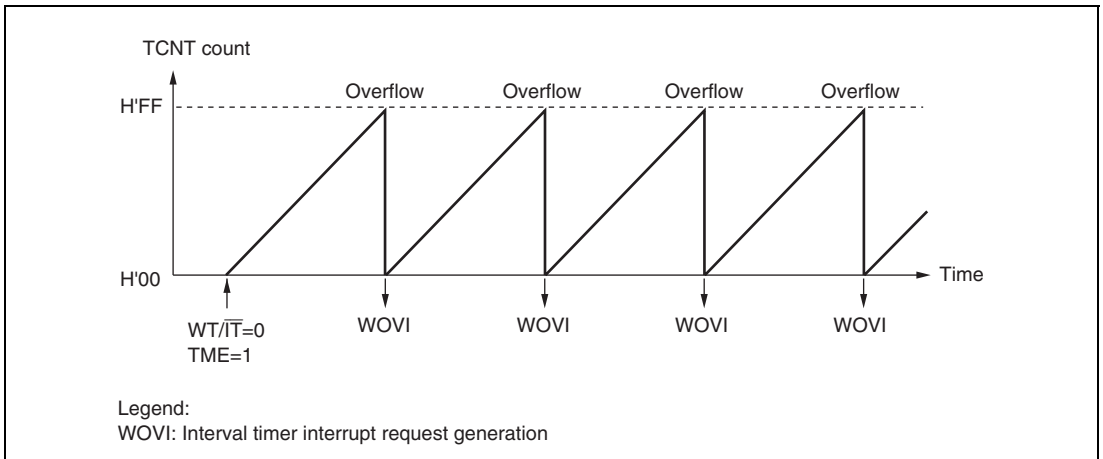

**Figure 14.2 Operation in Watchdog Timer Mode**

### 14.4.2 Interval Timer Mode

To use the WDT as an interval timer, set the  $WT/\overline{IT}$  bit to 0 and TME bit in TCSR to 1.

When the WDT is used as an interval timer, an interval timer interrupt (WOVI) is generated each time the TCNT overflows. Therefore, an interrupt can be generated at intervals.

When the TCNT overflows in interval timer mode, an interval timer interrupt (WOVI) is requested at the same time the OVF bit in the TCSR is set to 1.

**Figure 14.3 Operation in Interval Timer Mode**

## 14.5 Interrupt Source

During interval timer mode operation, an overflow generates an interval timer interrupt (WOVI). The interval timer interrupt is requested whenever the OVF flag is set to 1 in TCSR. OVF must be cleared to 0 in the interrupt handling routine.

**Table 14.2 WDT Interrupt Source**

| Name | Interrupt Source | Interrupt Flag | DTC Activation |
|------|------------------|----------------|----------------|
| WOVI | TCNT overflow    | OVF            | Impossible     |

## 14.6 Usage Notes

### 14.6.1 Notes on Register Access

The watchdog timer's TCNT, TCSR, and RSTCSR registers differ from other registers in being more difficult to write to. The procedures for writing to and reading these registers are given below.

#### (1) Writing to TCNT, TCSR, and RSTCSR

TCNT and TCSR must be written to by a word transfer instruction. They cannot be written to by a byte transfer instruction.

TCNT and TCSR both have the same write address. Therefore, satisfy the relative condition shown in figure 14.4 to write to TCNT or TCSR. The transfer instruction writes the lower byte data to TCNT or TCSR according to the satisfied condition.

To write to RSTCSR, execute a word transfer instruction for address H'FFBE. A byte transfer instruction cannot perform writing to RSTCSR.

The method of writing 0 to the WOVF bit differs from that of writing to the RSTE bit. To write 0 to the WOVF bit, satisfy the lower condition shown in figure 14.4.

If satisfied, the transfer instruction clears the WOVF bit to 0, but has no effect on the RSTE bit. To write to the RSTE bit, satisfy the above condition shown in figure 14.4. If satisfied, the transfer instruction writes the value in bit 6 of the lower byte into the RSTE bit, but has no effect on the WOVF bit.

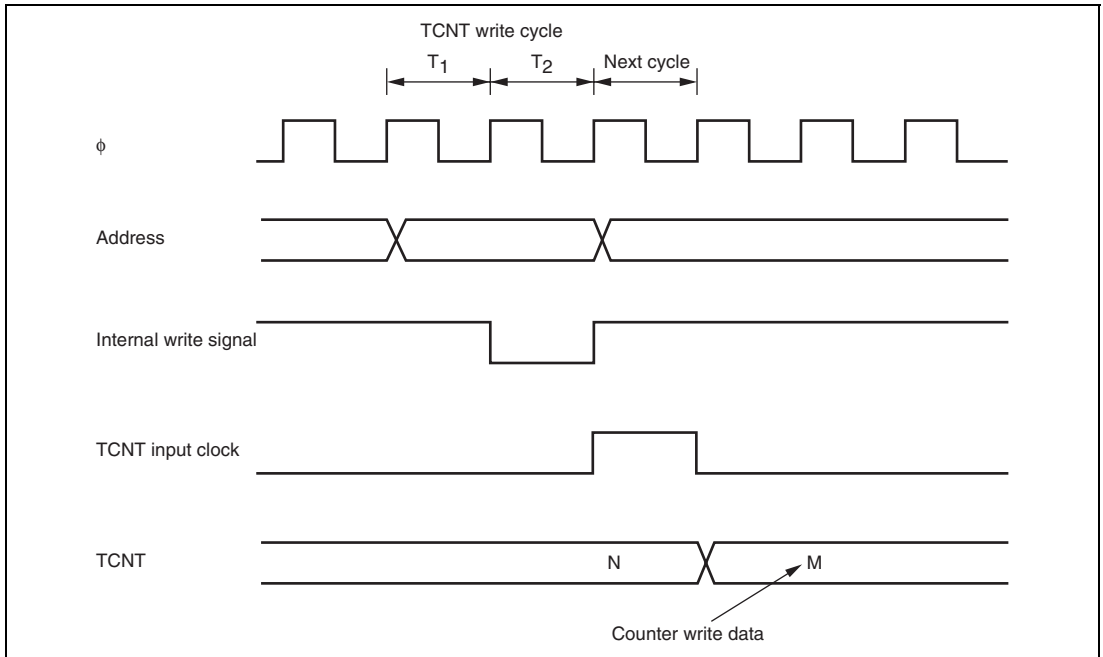

**Figure 14.4 Writing to TCNT, TCSR, and RSTCSR**

## (2) Reading TCNT, TCSR, and RSTCSR

These registers are read in the same way as other registers. The read addresses are H'FFBC for TCSR, H'FFBD for TCNT, and H'FFBF for RSTCSR.

### 14.6.2 Contention between Timer Counter (TCNT) Write and Increment

If a timer counter clock pulse is generated during the next cycle after the  $T_2$  state of a TCNT write cycle, the write takes priority and the timer counter is not incremented. Figure 14.5 shows this operation.

**Figure 14.5 Contention between TCNT Write and Increment**

### 14.6.3 Changing Value of CKS2 to CKS0

If bits CKS2 to CKS0 in TCSR are written to while the WDT is operating, errors could occur in the incrementation. Software must stop the watchdog timer (by clearing the TME bit to 0) before changing the value of bits CKS2 to CKS0.

### 14.6.4 Switching between Watchdog Timer Mode and Interval Timer Mode

If the mode is switched from watchdog timer to interval timer, while the WDT is operating, errors could occur in the incrementation. Software must stop the watchdog timer (by clearing the TME bit to 0) before switching the mode.

### 14.6.5 Internal Reset in Watchdog Timer Mode

This LSI is not reset internally if TCNT overflows while the RSTE bit is cleared to 0 during watchdog timer mode operation, but TCNT and TCSR of the WDT are reset.

TCNT, TCSR, and RSTCR cannot be written to while the  $\overline{\text{WDTOVF}}$  signal is low. Also note that a read of the WOVF flag is not recognized during this period. To clear the WOVF flag, therefore, read TCSR after the  $\overline{\text{WDTOVF}}$  signal goes high, then write 0 to the WOVF flag.

### 14.6.6 System Reset by $\overline{\text{WDTOVF}}$ Signal

If the  $\overline{\text{WDTOVF}}$  output signal is input to the  $\overline{\text{RES}}$  pin, the chip will not be initialized correctly. Make sure that the  $\overline{\text{WDTOVF}}$  signal is not input logically to the  $\overline{\text{RES}}$  pin.

To reset the entire system by means of the  $\overline{\text{WDTOVF}}$  signal, use the circuit shown in figure 14.6.

**Figure 14.6** Circuit for System Reset by  $\overline{\text{WDTOVF}}$  Signal (Example)

## Section 15 Serial Communication Interface (SCI, IrDA)

This LSI has five independent serial communication interface (SCI) channels. The SCI can handle both asynchronous and clocked synchronous serial communication. Serial data communication can be carried out with standard asynchronous communication chips such as a Universal Asynchronous Receiver/Transmitter (UART) or Asynchronous Communication Interface Adapter (ACIA). A function is also provided for serial communication between processors (multiprocessor communication function) in asynchronous mode. The SCI also supports an IC card (Smart Card) interface conforming to ISO/IEC 7816-3 (Identification Card) as an asynchronous serial communication interface extension function. One of the five SCI channels (SCI\_0) can generate an IrDA communication waveform conforming to IrDA specification version 1.0.

Figure 15.1 shows a block diagram of the SCI.

### 15.1 Features

- Choice of asynchronous or clocked synchronous serial communication mode
- Full-duplex communication capability

The transmitter and receiver are mutually independent, enabling transmission and reception to be executed simultaneously. Double-buffering is used in both the transmitter and the receiver, enabling continuous transmission and continuous reception of serial data.

- On-chip baud rate generator allows any bit rate to be selected.

External clock can be selected as a transfer clock source (except for in Smart Card interface mode).

- Choice of LSB-first or MSB-first transfer (except in the case of asynchronous mode 7-bit data)
- Four interrupt sources

Four interrupt sources — transmit-end, transmit-data-empty, receive-data-full, and receive error — that can issue requests. The transmit-data-empty interrupt and receive data full interrupts can activate the data transfer controller (DTC) or DMA controller (DMAC).

- Module stop state can be set.

## Asynchronous Mode

- Data length: 7 or 8 bits
- Stop bit length: 1 or 2 bits
- Parity: Even, odd, or none
- Receive error detection: Parity, overrun, and framing errors
- Break detection: Break can be detected by reading the RxD pin level directly in case of a framing error
- Average transfer rate generator (SCI\_2 only):
  - 115.152 or 460.606 kbps at 10.667-MHz operation
  - 115.196, 460.784, or 720 kbps at 16-MHz operation
  - 720 kbps at 32-MHz operation

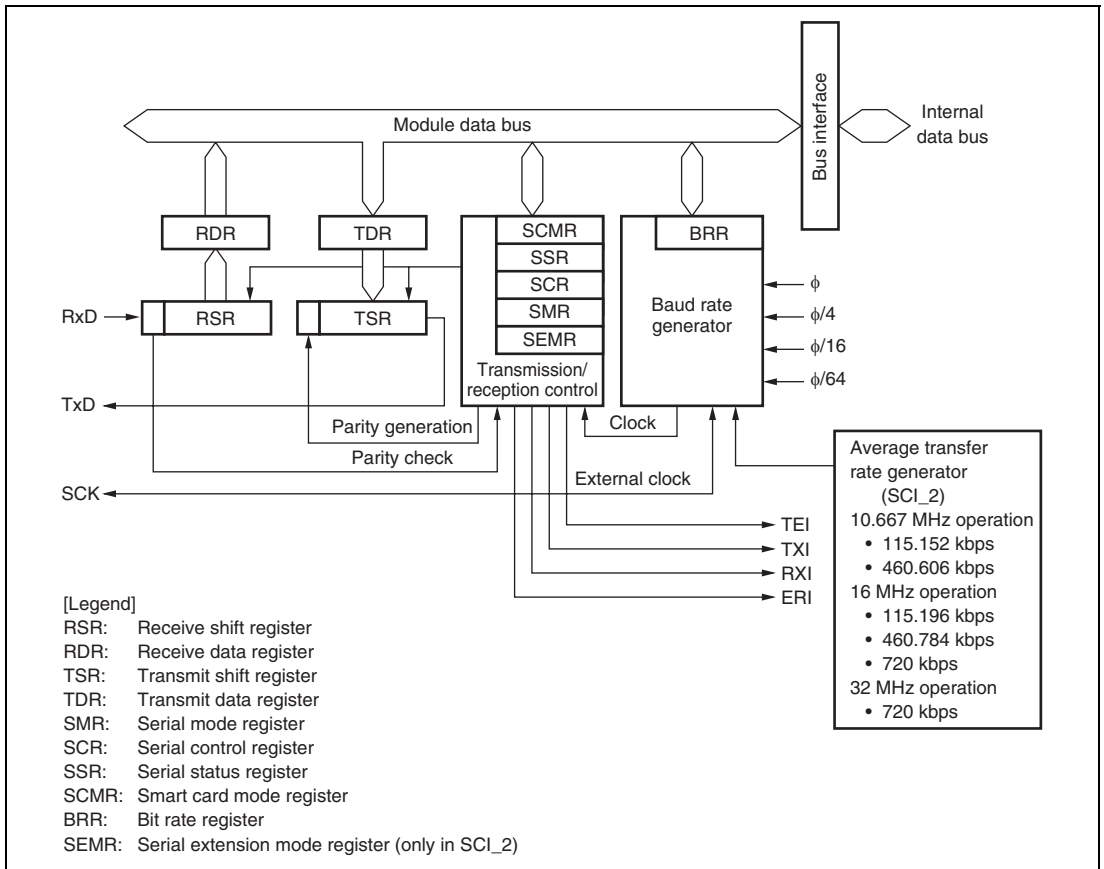

## Clocked Synchronous Mode

- Data length: 8 bits
- Receive error detection: Overrun errors detected

## Smart Card Interface

- Automatic transmission of error signal (parity error) in receive mode
- Error signal detection and automatic data retransmission in transmit mode
- Direct convention and inverse convention both supported

**Figure 15.1 Block Diagram of SCI**

## 15.2 Input/Output Pins

Table 15.1 shows the pin configuration of the serial communication interface.

**Table 15.1 Pin Configuration**

| Channel | Pin Name*  | I/O    | Function                                     |
|---------|------------|--------|--|
| 0       | SCK0       | I/O    | Channel 0 clock input/output                 |
|         | RxD0/IrRxD | Input  | Channel 0 receive data input (normal/IrDA)   |
|         | TxD0/IrTxD | Output | Channel 0 transmit data output (normal/IrDA) |
| 1       | SCK1       | I/O    | Channel 1 clock input/output                 |
|         | RxD1       | Input  | Channel 1 receive data input                 |
|         | TxD1       | Output | Channel 1 transmit data output               |
| 2       | SCK2       | I/O    | Channel 2 clock input/output                 |
|         | RxD2       | Input  | Channel 2 receive data input                 |
|         | TxD2       | Output | Channel 2 transmit data output               |
| 3       | SCK3       | I/O    | Channel 3 clock input/output                 |
|         | RxD3       | Input  | Channel 3 receive data input                 |
|         | TxD3       | Output | Channel 3 transmit data output               |
| 4       | SCK4       | I/O    | Channel 4 clock input/output                 |
|         | RxD4       | Input  | Channel 4 receive data input                 |
|         | TxD4       | Output | Channel 4 transmit data output               |

Note: \* Pin names SCK, RxD, and TxD are used in the text for all channels, omitting the channel designation.

## 15.3 Register Descriptions

The SCI has the following registers. The serial mode register (SMR), serial status register (SSR), and serial control register (SCR) are described separately for normal serial communication interface mode and Smart Card interface mode because their bit functions partially differ.

- Receive shift register\_0 (RSR\_0)
- Transmit shift register\_0 (TSR\_0)
- Receive data register\_0 (RDR\_0)
- Transmit data register\_0 (TDR\_0)
- Serial mode register\_0 (SMR\_0)
- Serial control register\_0 (SCR\_0)
- Serial status register\_0 (SSR\_0)
- Smart card mode register\_0 (SCMR\_0)
- Bit rate register\_0 (BRR\_0)
- IrDA control register\_0 (IrCR\_0)
- Receive shift register\_1 (RSR\_1)
- Transmit shift register\_1 (TSR\_1)
- Receive data register\_1 (RDR\_1)
- Transmit data register\_1 (TDR\_1)
- Serial mode register\_1 (SMR\_1)
- Serial control register\_1 (SCR\_1)
- Serial status register\_1 (SSR\_1)
- Smart card mode register\_1 (SCMR\_1)
- Bit rate register\_1 (BRR\_1)
- Receive shift register\_2 (RSR\_2)
- Transmit shift register\_2 (TSR\_2)
- Receive data register\_2 (RDR\_2)
- Transmit data register\_2 (TDR\_2)
- Serial mode register\_2 (SMR\_2)
- Serial control register\_2 (SCR\_2)
- Serial status register\_2 (SSR\_2)
- Smart card mode register\_2 (SCMR\_2)
- Bit rate register\_2 (BRR\_2)
- Serial extension mode register\_2 (SEMR\_2)

- Receive shift register\_3 (RSR\_3)
- Transmit shift register\_3 (TSR\_3)
- Receive data register\_3 (RDR\_3)
- Transmit data register\_3 (TDR\_3)
- Serial mode register\_3 (SMR\_3)
- Serial control register\_3 (SCR\_3)
- Serial status register\_3 (SSR\_3)
- Smart card mode register\_3 (SCMR\_3)
- Bit rate register\_3 (BRR\_3)
- Receive shift register\_4 (RSR\_4)
- Transmit shift register\_4 (TSR\_4)
- Receive data register\_4 (RDR\_4)
- Transmit data register\_4 (TDR\_4)
- Serial mode register\_4 (SMR\_4)
- Serial control register\_4 (SCR\_4)
- Serial status register\_4 (SSR\_4)
- Smart card mode register\_4 (SCMR\_4)
- Bit rate register\_4 (BRR\_4)

### 15.3.1 Receive Shift Register (RSR)

RSR is a shift register used to receive serial data that is input to the RxD pin and convert it into parallel data. When one byte of data has been received, it is transferred to RDR automatically. RSR cannot be directly accessed by the CPU.

### 15.3.2 Receive Data Register (RDR)

RDR is an 8-bit register that stores receive data. When the SCI has received one byte of serial data, it transfers the received serial data from RSR to RDR where it is stored. After this, RSR is receive-enabled. Since RSR and RDR function as a double buffer in this way, enables continuous receive operations to be performed. After confirming that the RDRF bit in SSR is set to 1, read RDR for only once. RDR cannot be written to by the CPU.

### 15.3.3 Transmit Data Register (TDR)

TDR is an 8-bit register that stores transmit data. When the SCI detects that TSR is empty, it transfers the transmit data written in TDR to TSR and starts transmission. The double-buffered structures of TDR and TSR enable continuous serial transmission. If the next transmit data has already been written to TDR during serial transmission, the SCI transfers the written data to TSR to continue transmission. Although TDR can be read or written to by the CPU at all times, to achieve reliable serial transmission, write transmit data to TDR for only once after confirming that the TDRE bit in SSR is set to 1.

### 15.3.4 Transmit Shift Register (TSR)

TSR is a shift register that transmits serial data. To perform serial data transmission, the SCI first transfers transmit data from TDR to TSR, then sends the data to the TxD pin starting. TSR cannot be directly accessed by the CPU.

### 15.3.5 Serial Mode Register (SMR)

SMR is used to set the SCI's serial transfer format and select the on-chip baud rate generator clock source. Some bit functions of SMR differ in normal serial communication interface mode and Smart Card interface mode.

Normal Serial Communication Interface Mode (When SMIF bit in SCMR is 0)

| Bit | Bit Name    | Initial Value | R/W | Description   |
|-----|-------------|---------------|-----|---|
| 7   | $C/\bar{A}$ | 0             | R/W | Communication Mode<br>0: Asynchronous mode<br>1: Clocked synchronous mode   |
| 6   | CHR         | 0             | R/W | Character Length (enabled only in asynchronous mode)<br>0: Selects 8 bits as the data length.<br>1: Selects 7 bits as the data length. LSB-first is fixed and the MSB (bit 7) of TDR is not transmitted in transmission.<br><br>In clocked synchronous mode, a fixed data length of 8 bits is used. |

| Bit | Bit Name    | Initial Value | R/W | Description  |
|-----|-------------|---------------|-----|--|
| 5   | PE          | 0             | R/W | <p>Parity Enable (enabled only in asynchronous mode)</p> <p>When this bit is set to 1, the parity bit is added to transmit data before transmission, and the parity bit is checked in reception. For a multiprocessor format, parity bit addition and checking are not performed regardless of the PE bit setting.</p>   |
| 4   | O $\bar{E}$ | 0             | R/W | <p>Parity Mode (enabled only when the PE bit is 1 in asynchronous mode)</p> <p>0: Selects even parity.<br/>1: Selects odd parity.</p>  |
| 3   | STOP        | 0             | R/W | <p>Stop Bit Length (enabled only in asynchronous mode)</p> <p>Selects the stop bit length in transmission.</p> <p>0: 1 stop bit<br/>1: 2 stop bits</p> <p>In reception, only the first stop bit is checked regardless of the STOP bit setting. If the second stop bit is 0, it is treated as the start bit of the next transmit character.</p>   |
| 2   | MP          | 0             | R/W | <p>Multiprocessor Mode (enabled only in asynchronous mode)</p> <p>When this bit is set to 1, the multiprocessor communication function is enabled. The PE bit and O<math>\bar{E}</math> bit settings are invalid in multiprocessor mode.</p>   |
| 1   | CKS1        | 0             | R/W | Clock Select 1 and 0   |
| 0   | CKS0        | 0             | R/W | <p>These bits select the clock source for the on-chip baud rate generator.</p> <p>00: <math>\phi</math> clock (n = 0)<br/>01: <math>\phi/4</math> clock (n = 1)<br/>10: <math>\phi/16</math> clock (n = 2)<br/>11: <math>\phi/64</math> clock (n = 3)</p> <p>For the relation between the bit rate register setting and the baud rate, see section 15.3.9, Bit Rate Register (BRR). n is the decimal display of the value of n in BRR (see section 15.3.9, Bit Rate Register (BRR)).</p> |

## Smart Card Interface Mode (When SMIF bit in SCMR is 1)

| Bit | Bit Name    | Initial Value | R/W | Description  |
|-----|-------------|---------------|-----|--|
| 7   | GM          | 0             | R/W | <p>GSM Mode</p> <p>When this bit is set to 1, the SCI operates in GSM mode. In GSM mode, the timing of the TEND setting is advanced by 11.0 etu (Elementary Time Unit: the time for transfer of 1 bit), and clock output control mode addition is performed. For details, refer to section 15.7.8, Clock Output Control.</p> |
| 6   | BLK         | 0             | R/W | <p>When this bit is set to 1, the SCI operates in block transfer mode. For details on block transfer mode, refer to section 15.7.3, Block Transfer Mode.</p>   |
| 5   | PE          | 0             | R/W | <p>Parity Enable (enabled only in asynchronous mode)</p> <p>When this bit is set to 1, the parity bit is added to transmit data before transmission, and the parity bit is checked in reception. In Smart Card interface mode, this bit must be set to 1.</p>  |
| 4   | O $\bar{E}$ | 0             | R/W | <p>Parity Mode (enabled only when the PE bit is 1 in asynchronous mode)</p> <p>0: Selects even parity.<br/>1: Selects odd parity.</p> <p>For details on setting this bit in Smart Card interface mode, refer to section 15.7.2, Data Format (Except for Block Transfer Mode).</p>  |

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 3   | BCP1     | 0             | R/W | Basic Clock Pulse 1 and 0   |
| 2   | BCP0     | 0             | R/W | <p>These bits, in combination with the BCP2 bit in SCMR, select the number of basic clock cycles in a 1-bit transfer interval in Smart Card interface mode.</p> <p>BCP2 to BCP0 Settings:</p> <p>000: 93 clock cycles (S = 93)</p> <p>001: 128 clock cycles (S = 128)</p> <p>010: 186 clock cycles (S = 186)</p> <p>011: 512 clock cycles (S = 512)</p> <p>100: 32 clock cycles (S = 32) (initial value)</p> <p>101: 64 clock cycles (S = 64)</p> <p>110: 372 clock cycles (S = 372)</p> <p>111: 256 clock cycles (S = 256)</p> <p>For details, refer to section 15.7.4, Receive Data Sampling Timing and Reception Margin. S stands for the value of S in BRR (see section 15.3.9, Bit Rate Register (BRR)).</p> |
| 1   | CKS1     | 0             | R/W | Clock Select 1 and 0  |
| 0   | CKS0     | 0             | R/W | <p>These bits select the clock source for the on-chip baud rate generator.</p> <p>00: <math>\phi</math> clock (n = 0)</p> <p>01: <math>\phi/4</math> clock (n = 1)</p> <p>10: <math>\phi/16</math> clock (n = 2)</p> <p>11: <math>\phi/64</math> clock (n = 3)</p> <p>For the relation between the bit rate register setting and the baud rate, see section 15.3.9, Bit Rate Register (BRR). n is the decimal display of the value of n in BRR (see section 15.3.9, Bit Rate Register (BRR)).</p>   |

### 15.3.6 Serial Control Register (SCR)

SCR performs enabling or disabling of SCI transfer operations and interrupt requests, and selection of the transfer/receive clock source. For details on interrupt requests, refer to section 15.9, Interrupt Sources. Some bit functions of SCR differ in normal serial communication interface mode and Smart Card interface mode.

Normal Serial Communication Interface Mode (When SMIF bit in SCMR is 0)

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | TIE      | 0             | R/W | <p>Transmit Interrupt Enable</p> <p>When this bit is set to 1, TXI interrupt request is enabled.</p> <p>TXI interrupt request cancellation can be performed by reading 1 from the TDRE flag, then clearing it to 0, or clearing the TIE bit to 0.</p>   |
| 6   | RIE      | 0             | R/W | <p>Receive Interrupt Enable</p> <p>When this bit is set to 1, RXI and ERI interrupt requests are enabled.</p> <p>RXI and ERI interrupt request cancellation can be performed by reading 1 from the RDRF flag, or the FER, PER, or ORER flag, then clearing the flag to 0, or by clearing the RIE bit to 0.</p>  |
| 5   | TE       | 0             | R/W | <p>Transmit Enable</p> <p>When this bit is set to 1, transmission is enabled. In this state, serial transmission is started when transmit data is written to TDR and the TDRE flag in SSR is cleared to 0. SMR setting must be performed to decide the transfer format before setting the TE bit to 1.</p> <p>The TDRE flag in SSR is fixed at 1 if transmission is disabled by clearing this bit to 0.</p> |

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 4   | RE       | 0             | R/W | <p>Receive Enable</p> <p>When this bit is set to 1, reception is enabled.</p> <p>Serial reception is started in this state when a start bit is detected in asynchronous mode or serial clock input is detected in clocked synchronous mode. SMR setting must be performed to decide the transfer format before setting the RE bit to 1.</p> <p>Clearing the RE bit to 0 does not affect the RDRF, FER, PER, and ORER flags, which retain their states.</p>   |
| 3   | MPIE     | 0             | R/W | <p>Multiprocessor Interrupt Enable (enabled only when the MP bit in SMR is 1 in asynchronous mode)</p> <p>When this bit is set to 1, receive data in which the multiprocessor bit is 0 is skipped, and setting of the RDRF, FER, and ORER status flags in SSR is prohibited. On receiving data in which the multiprocessor bit is 1, this bit is automatically cleared and normal reception is resumed. For details, refer to section 15.5, Multiprocessor Communication Function.</p> <p>When receive data including MPB = 0 in SSR is received, receive data transfer from RSR to RDR, receive error detection, and setting of the RDRF, FER, and ORER flags in SSR, is not performed. When receive data including MPB = 1 is received, the MPB bit in SSR is set to 1, the MPIE bit is cleared to 0 automatically, and generation of RXI and ERI interrupts (when the TIE and RIE bits in SCR are set to 1) and FER and ORER flag setting is enabled.</p> |
| 2   | TEIE     | 0             | R/W | <p>Transmit End Interrupt Enable</p> <p>When this bit is set to 1, TEI interrupt request is enabled. TEI cancellation can be performed by reading 1 from the TDRE flag in SSR, then clearing it to 0 and clearing the TEND flag to 0, or by clearing the TEIE bit to 0.</p>  |

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 1   | CKE1     | 0             | R/W | Clock Enable 1 and 0  |
| 0   | CKE0     | 0             | R/W | <p>Selects the clock source and SCK pin function.</p> <p>Asynchronous mode</p> <p>00: On-chip baud rate generator<br/>SCK pin functions as I/O port</p> <p>01: On-chip baud rate generator<br/>(Outputs a clock of the same frequency as the bit rate from the SCK pin.)</p> <p>1x: External clock<br/>(Inputs a clock with a frequency 16 times the bit rate from the SCK pin.)</p> <p>Clocked synchronous mode</p> <p>0x: Internal clock (SCK pin functions as clock output)</p> <p>1x: External clock (SCK pin functions as clock input)</p> |

### 15.3.7 Serial Status Register (SSR)

SSR is a register containing status flags of the SCI and multiprocessor bits for transfer. 1 cannot be written to flags TDRE, RDRF, ORER, PER, and FER; they can only be cleared. Some bit functions of SSR differ in normal serial communication interface mode and Smart Card interface mode.

Normal Serial Communication Interface Mode (When SMIF bit in SCMR is 0)

| Bit | Bit Name | Initial Value | R/W    | Description  |
|-----|----------|---------------|--------|--|
| 7   | TDRE     | 1             | R/(W)* | <p>Transmit Data Register Empty</p> <p>Indicates whether TDR contains transmit data.</p> <p>[Setting conditions]</p> <ul style="list-style-type: none"> <li>• When the TE bit in SCR is 0</li> <li>• When data is transferred from TDR to TSR, and data writing to TDR is enabled.</li> </ul> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> <li>• When 0 is written to TDRE after reading TDRE = 1</li> <li>• When the DMAC or DTC is activated by a TXI interrupt request and transfers data to TDR</li> </ul>  |
| 6   | RDRF     | 0             | R/(W)* | <p>Receive Data Register Full</p> <p>Indicates that the received data is stored in RDR.</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> <li>• When serial reception ends normally and receive data is transferred from RSR to RDR</li> </ul> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> <li>• When 0 is written to RDRF after reading RDRF = 1</li> <li>• When the DMAC or DTC is activated by an RXI interrupt and transferred data from RDR</li> </ul> <p>The RDRF flag is not affected and retains its previous value when the RE bit in SCR is cleared to 0. Exercise care because if reception of the next data is completed while the RDRF flag is set to 1, an overrun error occurs and receive data will be lost.</p> |

| Bit | Bit Name | Initial Value | R/W    | Description   |
|-----|----------|---------------|--------|---|
| 5   | ORER     | 0             | R/(W)* | <p>Overrun Error</p> <p>Indicates that an overrun error occurred while receiving and the reception has ended abnormally.</p> <p>[Setting condition]</p> <ul style="list-style-type: none"><li>When the next serial reception is completed while RDRF = 1</li></ul> <p>The receive data prior to the overrun error is retained in RDR, and the data received subsequently is lost. Also, subsequent serial reception cannot be continued while the ORER flag is set to 1. In clocked synchronous mode, serial transmission cannot be continued, either.</p> <p>[Clearing condition]</p> <ul style="list-style-type: none"><li>When 0 is written to ORER after reading ORER = 1</li></ul> <p>The ORER flag is not affected and retains its previous state when the RE bit in SCR is cleared to 0.</p> |

| Bit | Bit Name | Initial Value | R/W    | Description   |
|-----|----------|---------------|--------|---|
| 4   | FER      | 0             | R/(W)* | <p><b>Framing Error</b></p> <p>Indicates that a framing error occurred while receiving in asynchronous mode and the reception has ended abnormally.</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> <li>When the stop bit is 0           <p>In 2-stop-bit mode, only the first stop bit is checked for a value of 0; the second stop bit is not checked. If a framing error occurs, the receive data is transferred to RDR but the RDRF flag is not set. Also, subsequent serial reception cannot be continued while the FER flag is set to 1. In clocked synchronous mode, serial transmission cannot be continued, either.</p> </li> </ul> <p>[Clearing condition]</p> <ul style="list-style-type: none"> <li>When 0 is written to FER after reading FER = 1           <p>The FER flag is not affected and retains its previous state when the RE bit in SCR is cleared to 0.</p> </li> </ul> |
| 3   | PER      | 0             | R/(W)* | <p><b>Parity Error</b></p> <p>Indicates that a parity error occurred while receiving in asynchronous mode and the reception has ended abnormally.</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> <li>When a parity error is detected during reception           <p>If a parity error occurs, the receive data is transferred to RDR but the RDRF flag is not set. Also, subsequent serial reception cannot be continued while the PER flag is set to 1. In clocked synchronous mode, serial transmission cannot be continued, either.</p> </li> </ul> <p>[Clearing condition]</p> <ul style="list-style-type: none"> <li>When 0 is written to PER after reading PER = 1           <p>The PER flag is not affected and retains its previous state when the RE bit in SCR is cleared to 0.</p> </li> </ul>   |

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 2   | TEND     | 1             | R   | Transmit End<br>[Setting conditions] <ul style="list-style-type: none"> <li>• When the TE bit in SCR is 0</li> <li>• When TDRE = 1 at transmission of the last bit of a 1-byte serial transmit character</li> </ul> [Clearing conditions] <ul style="list-style-type: none"> <li>• When 0 is written to TDRE after reading TDRE = 1</li> <li>• When the DMAC or DTC is activated by a TXI interrupt and writes data to TDR</li> </ul> |
| 1   | MPB      | 0             | R   | Multiprocessor Bit<br>MPB stores the multiprocessor bit in the receive data. When the RE bit in SCR is cleared to 0 its previous state is retained.   |
| 0   | MPBT     | 0             | R/W | Multiprocessor Bit Transfer<br>MPBT sets the multiprocessor bit to be added to the transmit data.   |

Note: \* Only 0 can be written, to clear the flag.

## Smart Card Interface Mode (When SMIF bit in SCMR is 1)

| Bit | Bit Name | Initial Value | R/W    | Description  |
|-----|----------|---------------|--------|--|
| 7   | TDRE     | 1             | R/(W)* | <p>Transmit Data Register Empty</p> <p>Indicates whether TDR contains transmit data.</p> <p>[Setting conditions]</p> <ul style="list-style-type: none"> <li>• When the TE bit in SCR is 0</li> <li>• When data is transferred from TDR to TSR, and data writing to TDR is enabled.</li> </ul> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> <li>• When 0 is written to TDRE after reading TDRE = 1</li> <li>• When the DMAC or DTC is activated by a TXI interrupt request and transfers data to TDR</li> </ul>  |
| 6   | RDRF     | 0             | R/(W)* | <p>Receive Data Register Full</p> <p>Indicates that the received data is stored in RDR.</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> <li>• When serial reception ends normally and receive data is transferred from RSR to RDR</li> </ul> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> <li>• When 0 is written to RDRF after reading RDRF = 1</li> <li>• When the DMAC or DTC is activated by an RXI interrupt and transferred data from RDR</li> </ul> <p>The RDRF flag is not affected and retains its previous value when the RE bit in SCR is cleared to 0. Exercise care because if reception of the next data is completed while the RDRF flag is set to 1, an overrun error occurs and receive data will be lost.</p> |

| Bit | Bit Name | Initial Value | R/W    | Description   |

### 15.3.9 Bit Rate Register (BRR)

BRR is an 8-bit register that adjusts the bit rate. As the SCI performs baud rate generator control independently for each channel, different bit rates can be set for each channel. Table 15.2 shows the relationships between the N setting in BRR and bit rate B for normal asynchronous mode, clocked synchronous mode, and Smart Card interface mode. The initial value of BRR is H'FF, and it can be read or written to by the CPU at all times.

**Table 15.2 Relationships between N Setting in BRR and Bit Rate B**

| Mode                      | ABCS Bit | Bit Rate   | Error   |
|---------------------------|----------|--|---|
| Asynchronous Mode         | 0        | $B = \frac{\phi \times 10^6}{64 \times 2^{2n-1} \times (N + 1)}$ | $\text{Error (\%)} = \left\{ \frac{\phi \times 10^6}{B \times 64 \times 2^{2n-1} \times (N + 1)} - 1 \right\} \times 100$ |
|                           | 1        | $B = \frac{\phi \times 10^6}{32 \times 2^{2n-1} \times (N + 1)}$ | $\text{Error (\%)} = \left\{ \frac{\phi \times 10^6}{B \times 32 \times 2^{2n-1} \times (N + 1)} - 1 \right\} \times 100$ |
| Clocked Synchronous Mode  |          | $B = \frac{\phi \times 10^6}{8 \times 2^{2n-1} \times (N + 1)}$  |   |
| Smart Card Interface Mode |          | $B = \frac{\phi \times 10^6}{S \times 2^{2n+1} \times (N + 1)}$  | $\text{Error (\%)} = \left\{ \frac{\phi \times 10^6}{B \times S \times 2^{2n+1} \times (N + 1)} - 1 \right\} \times 100$  |

Note: B: Bit rate (bit/s)

N: BRR setting for baud rate generator ( $0 \leq N \leq 255$ )

$\phi$ : Operating frequency (MHz)

n and S: Determined by the SMR settings shown in the following tables.

| SMR Setting |      |   | SCMR Setting | SMR Setting |      |     |
|-------------|------|---|--------------|-------------|------|-----|
| CKS1        | CKS0 | n | BCP2         | BCP1        | BCP0 | S   |
| 0           | 0    | 0 | 0            | 0           | 0    | 93  |
| 0           | 1    | 1 | 0            | 0           | 1    | 128 |
| 1           | 0    | 2 | 0            | 1           | 0    | 186 |
| 1           | 1    | 3 | 0            | 1           | 1    | 512 |
|             |      |   | 1            | 0           | 0    | 32  |
|             |      |   | 1            | 0           | 1    | 64  |
|             |      |   | 1            | 1           | 0    | 372 |
|             |      |   | 1            | 1           | 1    | 256 |

Table 15.3 shows sample N settings in BRR in normal asynchronous mode. Table 15.4 shows the maximum bit rate for each frequency in normal asynchronous mode. Table 15.6 shows sample N settings in BRR in clocked synchronous mode. Table 15.8 shows sample N settings in BRR in Smart Card interface mode. In Smart Card interface mode, S (the number of basic clock cycles in a 1-bit transfer interval) can be selected. For details, refer to section 15.7.4, Receive Data Sampling Timing and Reception Margin. Tables 15.5 and 15.7 show the maximum bit rates with external clock input.

The bit rate should be twice the value in table 15.3 when the ABCS bit in the serial expansion mode register of the SCI\_2 (SEMR\_2) is 1 in asynchronous mode.

**Table 15.3 BRR Settings for Various Bit Rates (Asynchronous Mode)**

| Bit Rate<br>(bit/s) | Operating Frequency $\phi$ (MHz) |     |           |        |     |           |    |     |           |    |     |           |

| 38400               | 0                                | 19  | 1.73      | 0  | 23  | 1.73      | 0  | 26  | -0.54     |

Note: For the SCI\_2, values in the table are the examples with ABCS = 0 in SEMR\_2. When ABCS = 1, the bit rates should be twice the values given above.

**Table 15.4 Maximum Bit Rate for Each Frequency (Asynchronous Mode)**

| $\phi$ (MHz) | Maximum Bit Rate (bit/s) | n | N |
|--------------|--------------------------|---|---|
| 8            | 250000                   | 0 | 0 |
| 9.8304       | 307200                   | 0 | 0 |
| 10           | 312500                   | 0 | 0 |
| 12           | 375000                   | 0 | 0 |
| 12.288       | 384000                   | 0 | 0 |
| 14           | 437500                   | 0 | 0 |
| 14.7456      | 460800                   | 0 | 0 |
| 16           | 500000                   | 0 | 0 |
| 17.2032      | 537600                   | 0 | 0 |
| 18           | 562500                   | 0 | 0 |
| 19.6608      | 614400                   | 0 | 0 |
| 20           | 625000                   | 0 | 0 |
| 25           | 781250                   | 0 | 0 |
| 30           | 937500                   | 0 | 0 |
| 33           | 1031250                  | 0 | 0 |

Note: For the SCI\_2, values in the table are the examples with ABCS = 0 in SEMR\_2. When ABCS = 1, the bit rates should be twice the values given above.

**Table 15.5 Maximum Bit Rate with External Clock Input (Asynchronous Mode)**

| $\phi$ (MHz) | External Input Clock (MHz) | Maximum Bit Rate (bit/s) |
|--------------|----------------------------|--------------------------|
| 8            | 2.0000                     | 125000                   |
| 9.8304       | 2.4576                     | 153600                   |
| 10           | 2.5000                     | 156250                   |
| 12           | 3.0000                     | 187500                   |
| 12.288       | 3.0720                     | 192000                   |
| 14           | 3.5000                     | 218750                   |
| 14.7456      | 3.6864                     | 230400                   |
| 16           | 4.0000                     | 250000                   |
| 17.2032      | 4.3008                     | 268800                   |
| 18           | 4.5000                     | 281250                   |

### 15.3.10 IrDA Control Register (IrCR)

IrCR selects the function of SCI\_0.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | IrE      | 0             | R/W | <p>IrDA Enable</p> <p>Specifies normal SCI mode or IrDA mode for SCI_0 input/output.</p> <p>0: Pins TxD0/IrTxD and RxD0/IrRxD function as TxD0 and RxD0</p> <p>1: Pins TxD0/IrTxD and RxD0/IrRxD function as IrTxD and IrRxD</p>   |
| 6   | IrCKS2   | 0             | R/W | IrDA Clock Select 2 to 0   |
| 5   | IrCKS1   | 0             | R/W | Specifies the high pulse width in IrTxD output pulse encoding when the IrDA function is enabled.   |
| 4   | IrCKS0   | 0             | R/W | <p>000: Pulse width = <math>B \times 3/16</math> (3/16 of bit rate)</p> <p>001: Pulse width = <math>\phi/2</math></p> <p>010: Pulse width = <math>\phi/4</math></p> <p>011: Pulse width = <math>\phi/8</math></p> <p>100: Pulse width = <math>\phi/16</math></p> <p>101: Pulse width = <math>\phi/32</math></p> <p>110: Pulse width = <math>\phi/64</math></p> <p>111: Pulse width = <math>\phi/128</math></p> |
| 3   | IrTxINV  | 0             | R/W | <p>IrTx Data Invert</p> <p>Specifies the logic level of the IrTxD output to be inverted. When inversion is performed, the high pulse width specified by bits 6 to 4 becomes the low pulse width.</p> <p>0: Transmit data is used as IrTxD output without change</p> <p>1: Transmit data is inverted before used as IrTxD output</p>  |

| Bit  | Bit Name | Initial Value | R/W | Description   |
|------|----------|---------------|-----|---|
| 2    | IrRxINV  | 0             | R/W | <p>IrRx Data Invert</p> <p>Specifies the logic level of the IrRxD output to be inverted. When inversion is performed, the high pulse width specified by bits 6 to 4 becomes the low pulse width.</p> <p>0: Transmit data is used as IrRxD output without change</p> <p>1: Transmit data is inverted before used as IrRxD output</p> |
| 1, 0 | —        | All 0         | —   | <p>Reserved</p> <p>These bits are always read as 0 and cannot be modified.</p>  |

### 15.3.11 Serial Extension Mode Register (SEMR)

SEMR selects the clock source in asynchronous mode for the SCI\_2. The basic clock can be automatically set by selecting the average transfer rate.

| Bit    | Bit Name | Initial Value | R/W | Description  |
|--------|----------|---------------|-----|--|
| 7 to 4 | —        | Undefined     | —   | <p>Reserved</p> <p>If these bits are read, an undefined value will be returned and cannot be modified.</p>   |
| 3      | ABCS     | 0             | R/W | <p>Asynchronous basic clock selection (valid only in asynchronous mode)</p> <p>Selects the basic clock for 1-bit period in asynchronous mode.</p> <p>0: Operates on a basic clock with a frequency of 16 times the transfer rate.</p> <p>1: Operates on a basic clock with a frequency of 8 times the transfer rate.</p> |

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|

## 15.4 Operation in Asynchronous Mode

Figure 15.2 shows the general format for asynchronous serial communication. One frame consists of a start bit (low level), followed by transfer data, a parity bit, and finally stop bits (high level). In asynchronous serial communication, the transmission line is usually held in the mark state (high level). The SCI monitors the transmission line, and when it goes to the space state (low level), recognizes a start bit and starts serial communication. In asynchronous serial communication, the communication line is usually held in the mark state (high level). The SCI monitors the communication line, and when it goes to the space state (low level), recognizes a start bit and starts serial communication. Inside the SCI, the transmitter and receiver are independent units, enabling full-duplex communication. Both the transmitter and the receiver also have a double-buffered structure, so that data can be read or written during transmission or reception, enabling continuous data transfer.

**Figure 15.2 Data Format in Asynchronous Communication  
(Example with 8-Bit Data, Parity, Two Stop Bits)**

### 15.4.1 Data Transfer Format

Table 15.10 shows the data transfer formats that can be used in asynchronous mode. Any of 12 transfer formats can be selected according to the SMR setting. For details on the multiprocessor bit, refer to section 15.5, Multiprocessor Communication Function.

**Table 15.10 Serial Transfer Formats (Asynchronous Mode)**

| SMR Settings |    |    |      | Serial Transfer Format and Frame Length |            |   |   |   |   |   |   |      |      |      |      |  |  |  |
|--------------|----|----|------|---|------------|---|---|---|---|---|---|------|------|------|------|--|--|--|
| CHR          | PE | MP | STOP | 1                                       | 2          | 3 | 4 | 5 | 6 | 7 | 8 | 9    | 10   | 11   | 12   |  |  |  |
| 0            | 0  | 0  | 0    | S                                       | 8-bit data |   |   |   |   |   |   |      | STOP |      |      |  |  |  |
| 0            | 0  | 0  | 1    | S                                       | 8-bit data |   |   |   |   |   |   |      | STOP | STOP |      |  |  |  |
| 0            | 1  | 0  | 0    | S                                       | 8-bit data |   |   |   |   |   |   |      | P    | STOP |      |  |  |  |
| 0            | 1  | 0  | 1    | S                                       | 8-bit data |   |   |   |   |   |   |      | P    | STOP | STOP |  |  |  |
| 1            | 0  | 0  | 0    | S                                       | 7-bit data |   |   |   |   |   |   | STOP |      |      |      |  |  |  |
| 1            | 0  | 0  | 1    | S                                       | 7-bit data |   |   |   |   |   |   | STOP | STOP |      |      |  |  |  |
| 1            | 1  | 0  | 0    | S                                       | 7-bit data |   |   |   |   |   |   | P    | STOP |      |      |  |  |  |
| 1            | 1  | 0  | 1    | S                                       | 7-bit data |   |   |   |   |   |   | P    | STOP | STOP |      |  |  |  |
| 0            | —  | 1  | 0    | S                                       | 8-bit data |   |   |   |   |   |   |      | MPB  | STOP |      |  |  |  |
| 0            | —  | 1  | 1    | S                                       | 8-bit data |   |   |   |   |   |   |      | MPB  | STOP | STOP |  |  |  |
| 1            | —  | 1  | 0    | S                                       | 7-bit data |   |   |   |   |   |   | MPB  | STOP |      |      |  |  |  |
| 1            | —  | 1  | 1    | S                                       | 7-bit data |   |   |   |   |   |   | MPB  | STOP | STOP |      |  |  |  |

[Legend]

S: Start bit

STOP: Stop bit

P: Parity bit

MPB: Multiprocessor bit

### 15.4.2 Receive Data Sampling Timing and Reception Margin in Asynchronous Mode

In asynchronous mode, the SCI operates on a basic clock with a frequency of 16 times the bit rate. In reception, the SCI samples the falling edge of the start bit using the basic clock, and performs internal synchronization. Receive data is latched at the middle of each bit by sampling the data at the rising edge of the 8th pulse of the basic clock as shown in figure 15.3. Thus the reception margin in asynchronous mode is given by formula (1) below.

$$M = \left\{ \left( 0.5 - \frac{1}{2N} \right) - (L - 0.5) F - \frac{|D - 0.5|}{N} (1 + F) \right\} \times 100 [\%] \quad \dots \text{Formula (1)}$$

Where M: Reception Margin

N: Ratio of bit rate to clock ( $N = 16$ )

D: Clock duty cycle ( $D = 0.5$  to  $1.0$ )

L: Frame length ( $L = 9$  to  $12$ )

F: Absolute value of clock rate deviation

Assuming values of  $F = 0$  and  $D = 0.5$  in formula (1), a reception margin is given by formula below.

$$M = \{ 0.5 - 1/(2 \times 16) \} \times 100 [\%] = 46.875\%$$

However, this is only the computed value, and a margin of 20% to 30% should be allowed in system design.

**Figure 15.3 Receive Data Sampling Timing in Asynchronous Mode**

### 15.4.3 Clock

Either an internal clock generated by the on-chip baud rate generator or an external clock input at the SCK pin can be selected as the SCI's serial clock, according to the setting of the  $C/\bar{A}$  bit in SMR and the CKE1 and CKE0 bits in SCR. When an external clock is input at the SCK pin, the clock frequency should be 16 times the bit rate used.

When the SCI is operated on an internal clock, the clock can be output from the SCK pin. The frequency of the clock output in this case is equal to the bit rate, and the phase is such that the rising edge of the clock is in the middle of the transmit data, as shown in figure 15.4.

**Figure 15.4 Relation between Output Clock and Transfer Data Phase (Asynchronous Mode)**

### 15.4.4 SCI Initialization (Asynchronous Mode)

Before transmitting and receiving data, you should first clear the TE and RE bits in SCR to 0, then initialize the SCI as shown in figure 15.5. When the operating mode, transfer format, etc., is changed, the TE and RE bits must be cleared to 0 before making the change. When the TE bit is cleared to 0, the TDRE flag is set to 1. Note that clearing the RE bit to 0 does not initialize the contents of the RDRF, PER, FER, and ORER flags, or the contents of RDR. When the external clock is used in asynchronous mode, the clock must be supplied even during initialization.

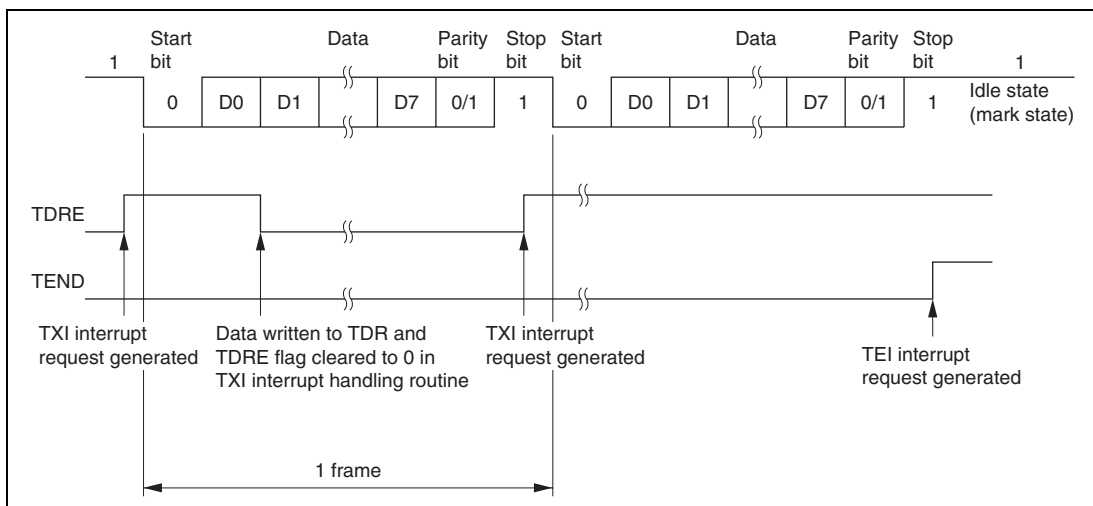

**Figure 15.5 Sample SCI Initialization Flowchart**

### 15.4.5 Data Transmission (Asynchronous Mode)

Figure 15.6 shows an example of the operation for transmission in asynchronous mode. In transmission, the SCI operates as described below.

1. The SCI monitors the TDRE flag in SSR, and if it is cleared to 0, it recognizes that data has been written to TDR, and transfers the data from TDR to TSR.
2. After transferring data from TDR to TSR, the SCI sets the TDRE flag to 1 and starts transmission. If the TIE bit is set to 1 at this time, a transmit data empty interrupt request (TXI) is generated. Because the TXI interrupt routine writes the next transmit data to TDR before transmission of the current transmit data has finished, continuous transmission can be enabled.
3. Data is sent from the TxD pin in the following order: start bit, transmit data, parity bit or multiprocessor bit (may be omitted depending on the format), and stop bit.
4. The SCI checks the TDRE flag at the timing for sending the stop bit.
5. If the TDRE flag is 0, the data is transferred from TDR to TSR, the stop bit is sent, and then serial transmission of the next frame is started.
6. If the TDRE flag is 1, the TEND flag in SSR is set to 1, the stop bit is sent, and then the "mark state" is entered in which 1 is output. If the TEIE bit in SCR is set to 1 at this time, a TEI interrupt request is generated.

Figure 15.7 shows a sample flowchart for transmission in asynchronous mode.

**Figure 15.6 Example of Operation in Transmission in Asynchronous Mode  
(Example with 8-Bit Data, Parity, One Stop Bit)**

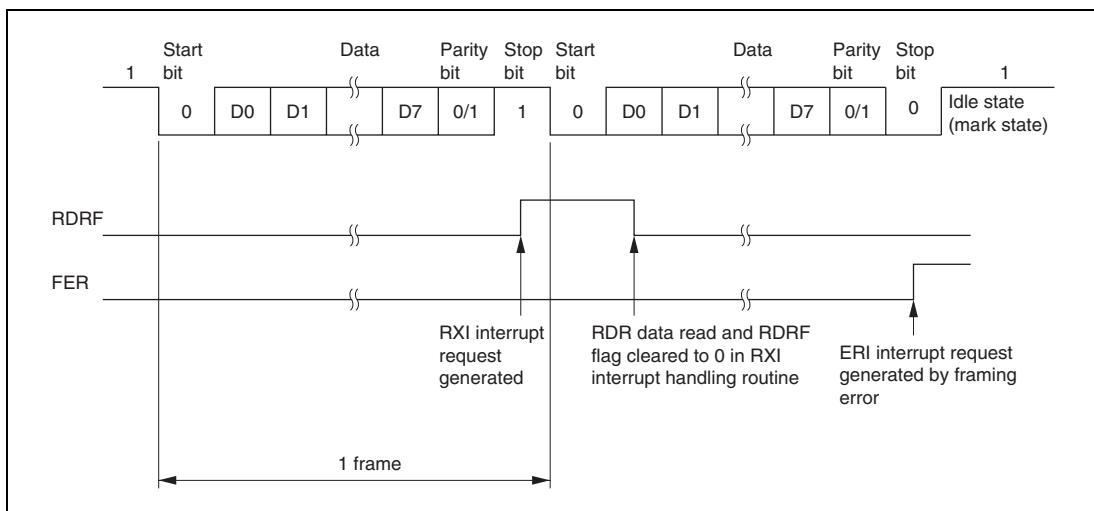

**Figure 15.7 Sample Serial Transmission Flowchart**

### 15.4.6 Serial Data Reception (Asynchronous Mode)

Figure 15.8 shows an example of the operation for reception in asynchronous mode. In serial reception, the SCI operates as described below.

1. The SCI monitors the communication line, and if a start bit is detected, performs internal synchronization, receives receive data in RSR, and checks the parity bit and stop bit.
2. If an overrun error (when reception of the next data is completed while the RDRF flag is still set to 1) occurs, the ORE bit in SSR is set to 1. If the RIE bit in SCR is set to 1 at this time, an ERI interrupt request is generated. Receive data is not transferred to RDR. The RDRF flag remains to be set to 1.
3. If a parity error is detected, the PER bit in SSR is set to 1 and receive data is transferred to RDR. If the RIE bit in SCR is set to 1 at this time, an ERI interrupt request is generated.
4. If a framing error (when the stop bit is 0) is detected, the FER bit in SSR is set to 1 and receive data is transferred to RDR. If the RIE bit in SCR is set to 1 at this time, an ERI interrupt request is generated.
5. If reception finishes successfully, the RDRF bit in SSR is set to 1, and receive data is transferred to RDR. If the RIE bit in SCR is set to 1 at this time, an RXI interrupt request is generated. Because the RXI interrupt routine reads the receive data transferred to RDR before reception of the next receive data has finished, continuous reception can be enabled.

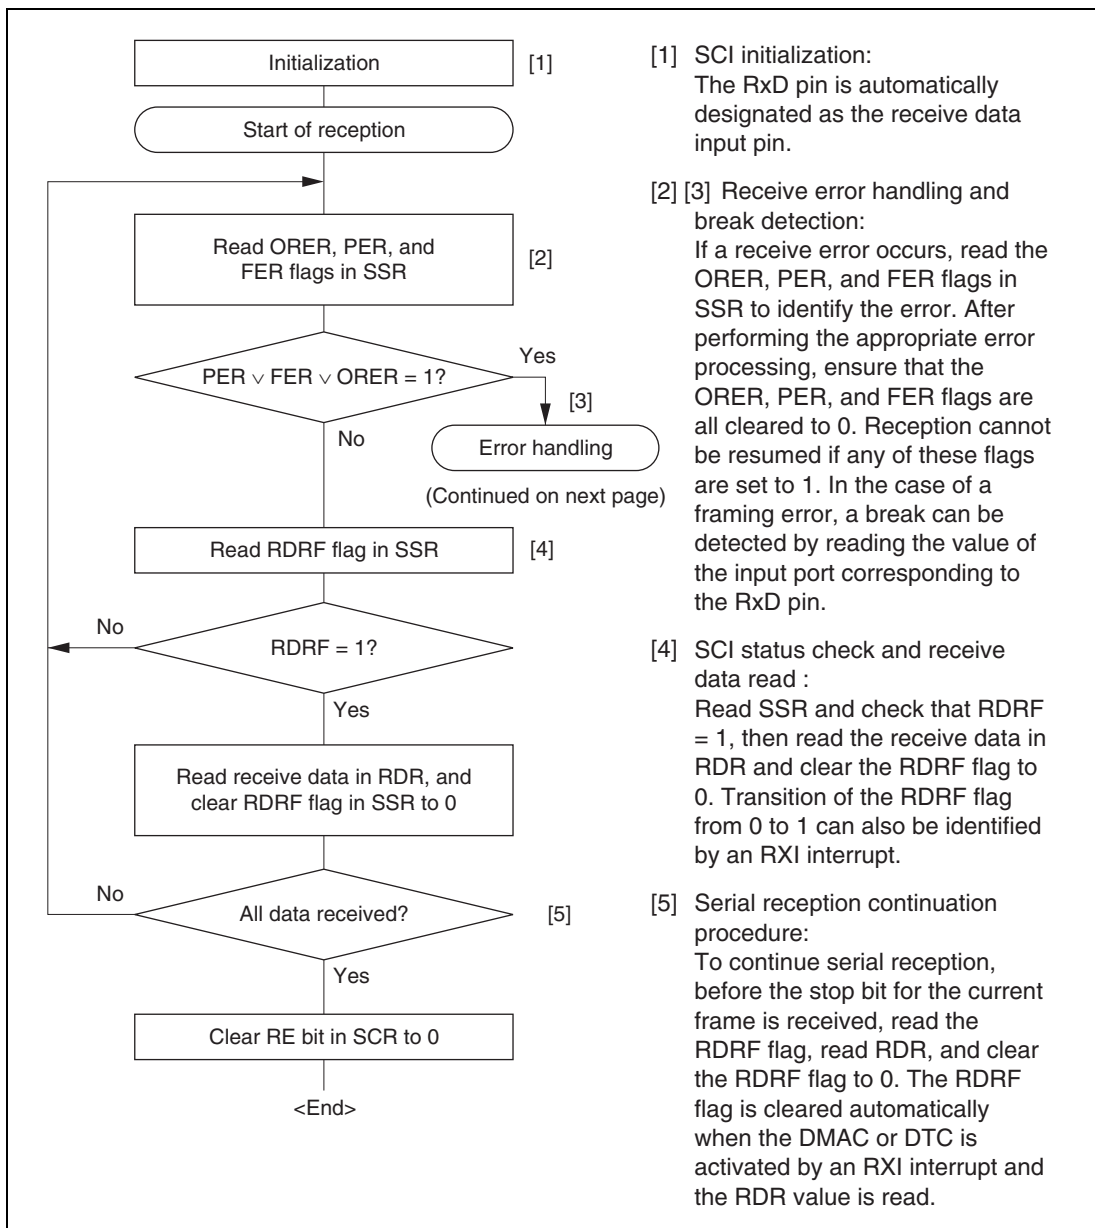

**Figure 15.8 Example of SCI Operation in Reception  
(Example with 8-Bit Data, Parity, One Stop Bit)**

Table 15.11 shows the states of the SSR status flags and receive data handling when a receive error is detected. If a receive error is detected, the RDRF flag retains its state before receiving data. Reception cannot be resumed while a receive error flag is set to 1. Accordingly, clear the ORER, FER, PER, and RDRF bits to 0 before resuming reception. Figure 15.9 shows a sample flowchart for serial data reception.

**Table 15.11 SSR Status Flags and Receive Data Handling**

| SSR Status Flag |      |     |     | Receive Data       | Receive Error Type                            |
|-----------------|------|-----|-----|--------------------|---|
| RDRF*           | ORER | FER | PER |                    |   |
| 1               | 1    | 0   | 0   | Lost               | Overflow error                                |
| 0               | 0    | 1   | 0   | Transferred to RDR | Framing error                                 |
| 0               | 0    | 0   | 1   | Transferred to RDR | Parity error                                  |
| 1               | 1    | 1   | 0   | Lost               | Overflow error + framing error                |
| 1               | 1    | 0   | 1   | Lost               | Overflow error + parity error                 |
| 0               | 0    | 1   | 1   | Transferred to RDR | Framing error + parity error                  |
| 1               | 1    | 1   | 1   | Lost               | Overflow error + framing error + parity error |

Note: \* The RDRF flag retains its state before data reception.

**Figure 15.9 Sample Serial Reception Data Flowchart (1)**

Figure 15.9 Sample Serial Reception Data Flowchart (2)

## 15.5 Multiprocessor Communication Function

Use of the multiprocessor communication function enables data transfer to be performed among a number of processors sharing communication lines by means of asynchronous serial communication using the multiprocessor format, in which a multiprocessor bit is added to the transfer data. When multiprocessor communication is carried out, each receiving station is addressed by a unique ID code. The serial communication cycle consists of two component cycles: an ID transmission cycle which specifies the receiving station, and a data transmission cycle to the specified receiving station. The multiprocessor bit is used to differentiate between the ID transmission cycle and the data transmission cycle. If the multiprocessor bit is 1, the cycle is an ID transmission cycle, and if the multiprocessor bit is 0, the cycle is a data transmission cycle. Figure 15.10 shows an example of inter-processor communication using the multiprocessor format. The transmitting station first sends communication data with a 1 multiprocessor bit added to the ID code of the receiving station. It then sends transmit data as data with a 0 multiprocessor bit added. When data with a 1 multiprocessor bit is received, the receiving station compares that data with its own ID. The station whose ID matches then receives the data sent next. Stations whose ID does not match continue to skip data until data with a 1 multiprocessor bit is again received.

The SCI uses the MPIE bit in SCR to implement this function. When the MPIE bit is set to 1, transfer of receive data from RSR to RDR, error flag detection, and setting the SSR status flags, RDRF, FER, and ORER to 1 are inhibited until data with a 1 multiprocessor bit is received. On reception of receive character with a 1 multiprocessor bit, the MPBR bit in SSR is set to 1 and the MPIE bit is automatically cleared, thus normal reception is resumed. If the RIE bit in SCR is set to 1 at this time, an RXI interrupt is generated.

When the multiprocessor format is selected, the parity bit setting is invalid. All other bit settings are the same as those in normal asynchronous mode. The clock used for multiprocessor communication is the same as that in normal asynchronous mode.

**Figure 15.10 Example of Communication Using Multiprocessor Format  
(Transmission of Data H'AA to Receiving Station A)**

### 15.5.1 Multiprocessor Serial Data Transmission

Figure 15.11 shows a sample flowchart for multiprocessor serial data transmission. For an ID transmission cycle, set the MPBT bit in SSR to 1 before transmission. For a data transmission cycle, clear the MPBT bit in SSR to 0 before transmission. All other SCI operations are the same as those in asynchronous mode.

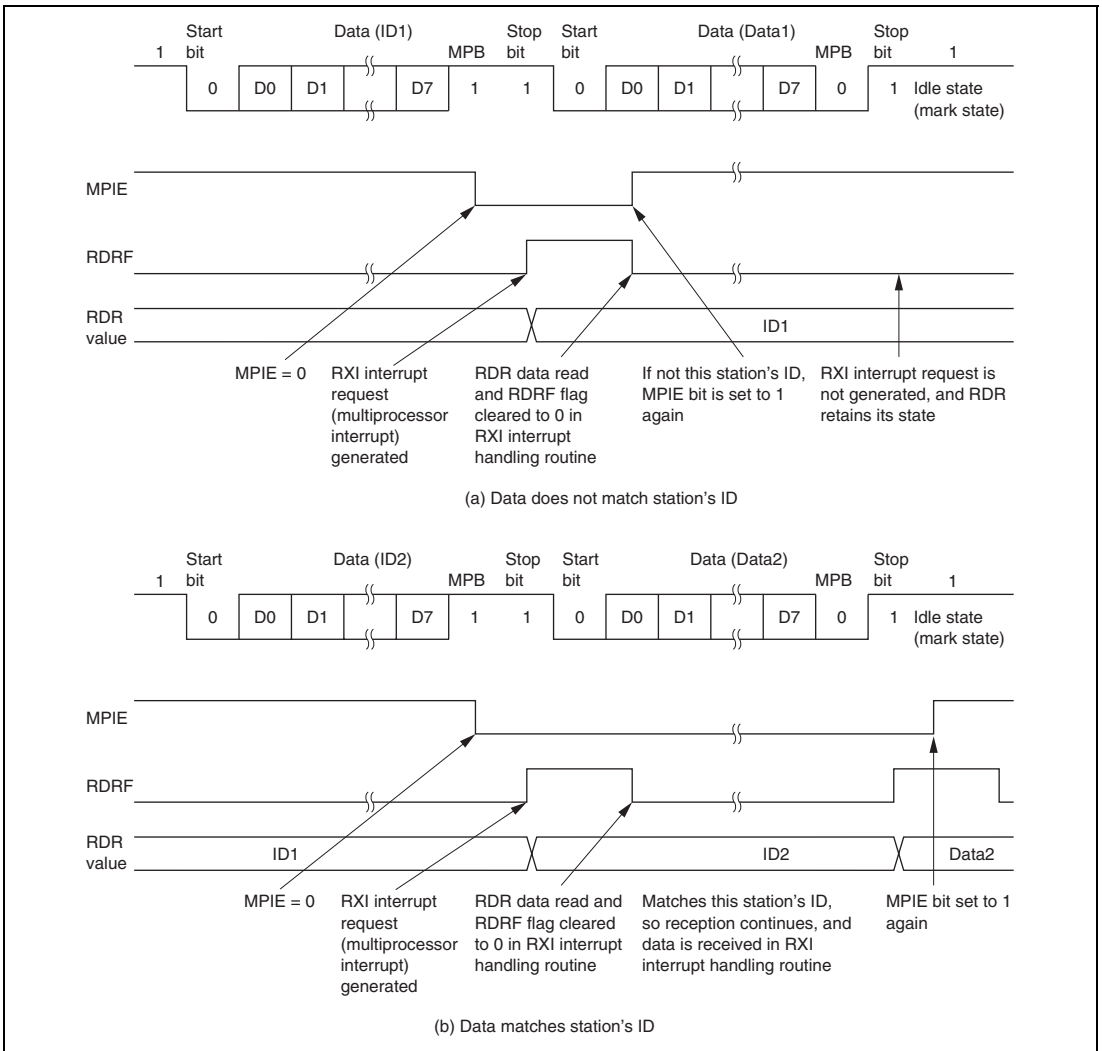

**Figure 15.11 Sample Multiprocessor Serial Transmission Flowchart**

## 15.5.2 Multiprocessor Serial Data Reception

Figure 15.13 shows a sample flowchart for multiprocessor serial data reception. If the MPIE bit in SCR is set to 1, data is skipped until data with a 1 multiprocessor bit is received. On receiving data with a 1 multiprocessor bit, the receive data is transferred to RDR. An RXI interrupt request is generated at this time. All other SCI operations are the same as in asynchronous mode. Figure 15.12 shows an example of SCI operation for multiprocessor format reception.

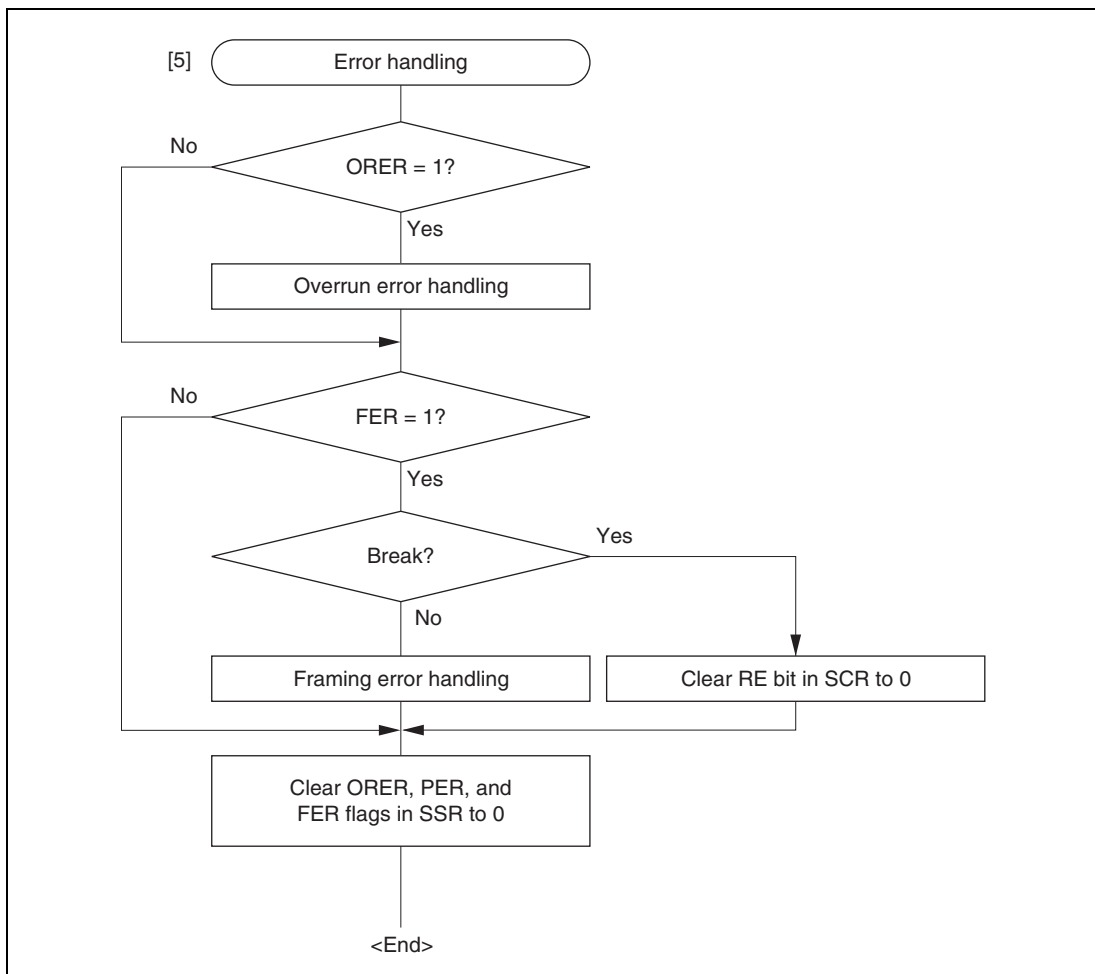

**Figure 15.12 Example of SCI Operation in Reception  
(Example with 8-Bit Data, Multiprocessor Bit, One Stop Bit)**

- [1] SCI initialization:  
The RxD pin is automatically designated as the receive data input pin.
- [2] ID reception cycle:  
Set the MPIE bit in SCR to 1.
- [3] SCI status check, ID reception and comparison:  
Read SSR and check that the RDRF flag is set to 1, then read the receive data in RDR and compare it with this station's ID. If the data is not this station's ID, set the MPIE bit to 1 again, and clear the RDRF flag to 0. If the data is this station's ID, clear the RDRF flag to 0.
- [4] SCI status check and data reception:  
Read SSR and check that the RDRF flag is set to 1, then read the data in RDR.
- [5] Receive error handling and break detection:  
If a receive error occurs, read the ORER and FER flags in SSR to identify the error. After performing the appropriate error handling, ensure that the ORER and FER flags are both cleared to 0. Reception cannot be resumed if either of these flags is set to 1. In the case of a framing error, a break can be detected by reading the RxD pin value.

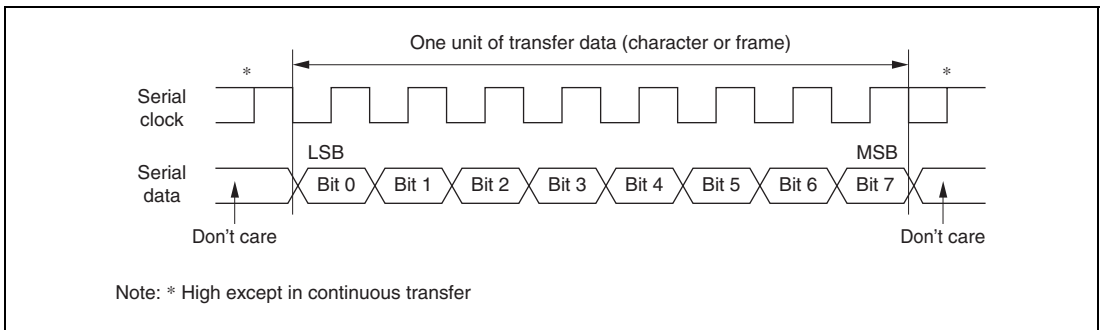

**Figure 15.13 Sample Multiprocessor Serial Reception Flowchart (1)**

**Figure 15.13 Sample Multiprocessor Serial Reception Flowchart (2)**

## 15.6 Operation in Clocked Synchronous Mode

Figure 15.14 shows the general format for clocked synchronous communication. In clocked synchronous mode, data is transmitted or received in synchronization with clock pulses. One character of communication data consists of 8-bit data. In clocked synchronous serial communication, data on the transmission line is output from one falling edge of the serial clock to the next. In clocked synchronous mode, the SCI receives data in synchronization with the rising edge of the serial clock. After 8-bit data is output, the transmission line holds the MSB state. In clocked synchronous mode, no parity or multiprocessor bit is added. Inside the SCI, the transmitter and receiver are independent units, enabling full-duplex communication by use of a common clock. Both the transmitter and the receiver also have a double-buffered structure, so that data can be read or written during transmission or reception, enabling continuous data transfer.

**Figure 15.14 Data Format in Clocked Synchronous Communication (For LSB-First)**

### 15.6.1 Clock

Either an internal clock generated by the on-chip baud rate generator or an external synchronization clock input at the SCK pin can be selected, according to the setting of CKE1 and CKE0 bits in SCR. When the SCI is operated on an internal clock, the serial clock is output from the SCK pin. Eight serial clock pulses are output in the transfer of one character, and when no transfer is performed the clock is fixed high.

## 15.6.2 SCI Initialization (Clocked Synchronous Mode)

Before transmitting and receiving data, you should first clear the TE and RE bits in SCR to 0, then initialize the SCI as described in a sample flowchart in figure 15.15. When the operating mode, transfer format, etc., is changed, the TE and RE bits must be cleared to 0 before making the change. When the TE bit is cleared to 0, the TDRE flag is set to 1. Note that clearing the RE bit to 0 does not change the contents of the RDRF, PER, FER, and ORER flags, or the contents of RDR.

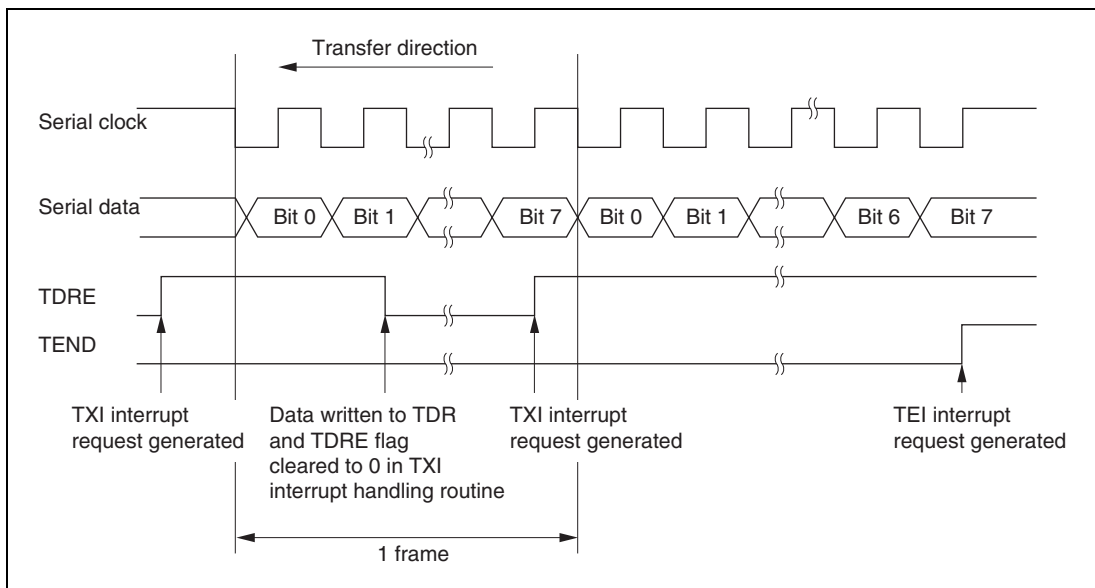

**Figure 15.15 Sample SCI Initialization Flowchart**

### 15.6.3 Serial Data Transmission (Clocked Synchronous Mode)

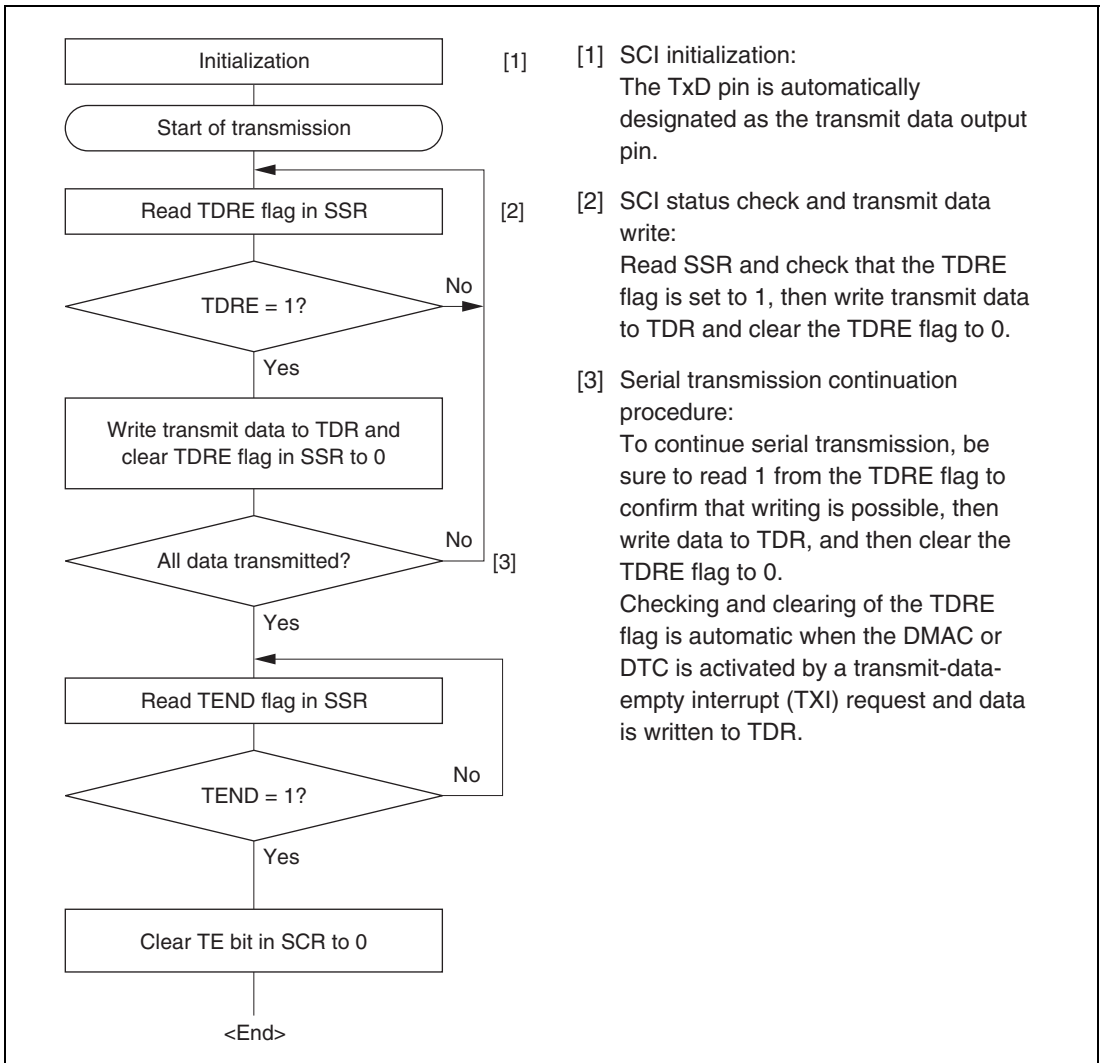

Figure 15.16 shows an example of SCI operation for transmission in clocked synchronous mode. In serial transmission, the SCI operates as described below.

1. The SCI monitors the TDRE flag in SSR, and if is 0, recognizes that data has been written to TDR, and transfers the data from TDR to TSR.
2. After transferring data from TDR to TSR, the SCI sets the TDRE flag to 1 and starts transmission. If the TIE bit in SCR is set to 1 at this time, a TXI interrupt request is generated. Because the TXI interrupt routine writes the next transmit data to TDR before transmission of the current transmit data has finished, continuous transmission can be enabled.
3. 8-bit data is sent from the TxD pin synchronized with the output clock when output clock mode has been specified and synchronized with the input clock when use of an external clock has been specified.
4. The SCI checks the TDRE flag at the timing for sending the MSB.
5. If the TDRE flag is cleared to 0, data is transferred from TDR to TSR, and serial transmission of the next frame is started.
6. If the TDRE flag is set to 1, the TEND flag in SSR is set to 1, and the TxD pin maintains the output state of the last bit. If the TEIE bit in SCR is set to 1 at this time, a TEI interrupt request is generated. The SCK pin is fixed high.

Figure 15.17 shows a sample flowchart for serial data transmission. Even if the TDRE flag is cleared to 0, transmission will not start while a receive error flag (ORER, FER, or PER) is set to 1. Make sure to clear the receive error flags to 0 before starting transmission. Note that clearing the RE bit to 0 does not clear the receive error flags.

**Figure 15.16 Sample SCI Transmission Operation in Clocked Synchronous Mode**

**Figure 15.17 Sample Serial Transmission Flowchart**

### 15.6.4 Serial Data Reception (Clocked Synchronous Mode)

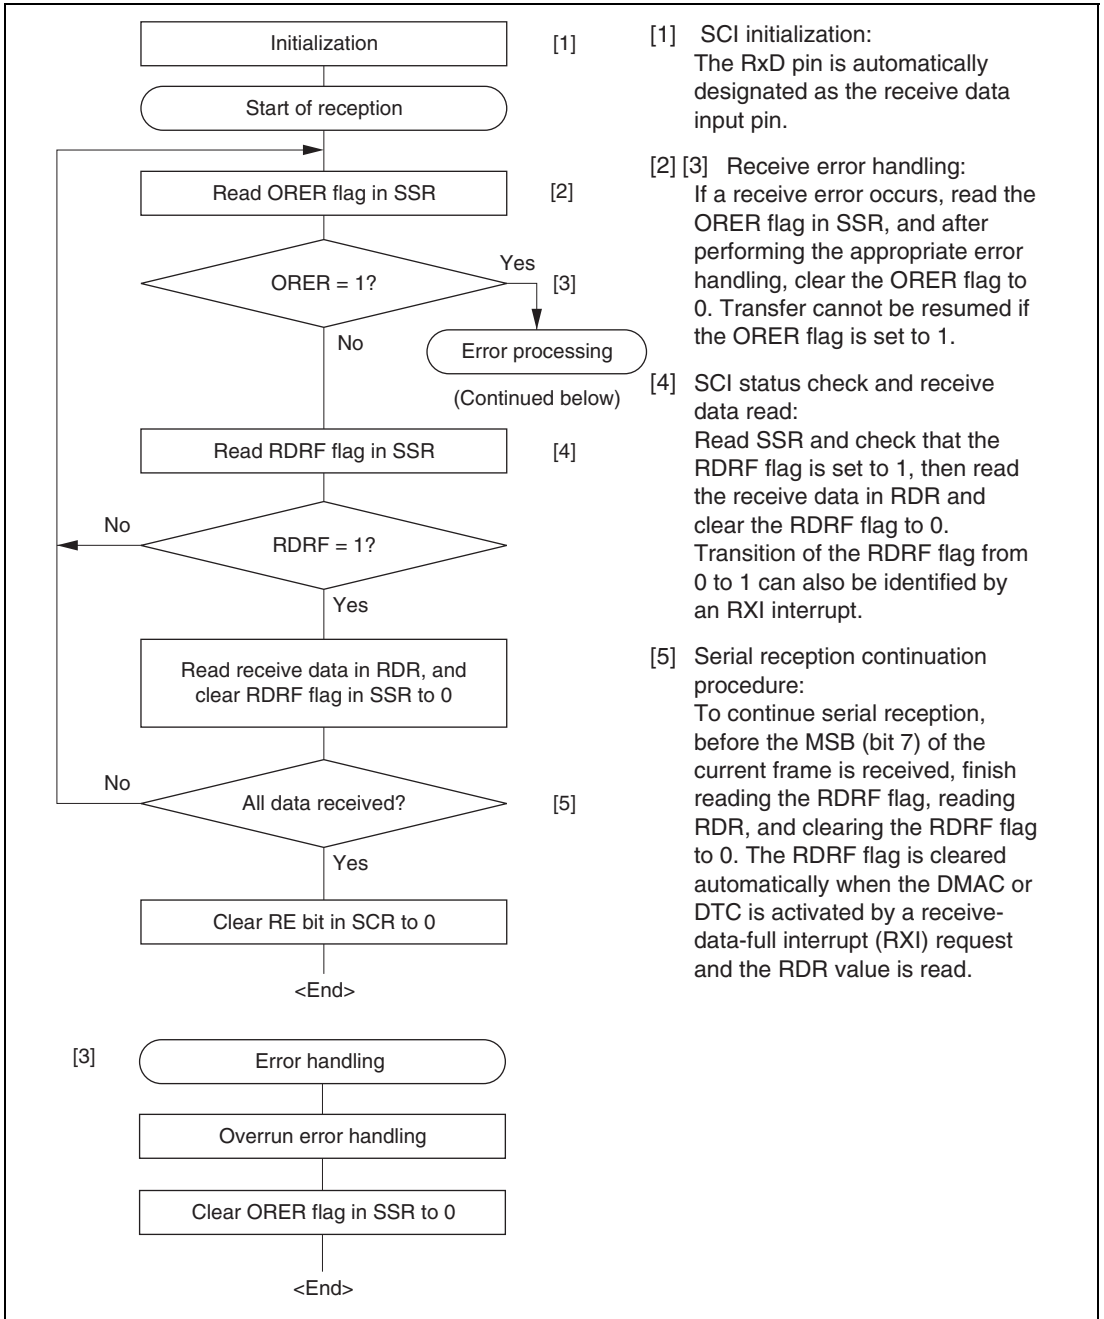

Figure 15.18 shows an example of SCI operation for reception in clocked synchronous mode. In serial reception, the SCI operates as described below.

1. The SCI performs internal initialization in synchronization with a synchronization clock input or output, starts receiving data, and stores the received data in RSR.
2. If an overrun error (when reception of the next data is completed while the RDRF flag is still set to 1) occurs, the ORER bit in SSR is set to 1. If the RIE bit in SCR is set to 1 at this time, an ERI interrupt request is generated. Receive data is not transferred to RDR. The RDRF flag remains to be set to 1.
3. If reception finishes successfully, the RDRF bit in SSR is set to 1, and receive data is transferred to RDR. If the RIE bit in SCR is set to 1 at this time, an RXI interrupt request is generated. Because the RXI interrupt routine reads the receive data transferred to RDR before reception of the next receive data has finished, continuous reception can be enabled.

**Figure 15.18 Example of SCI Operation in Reception**

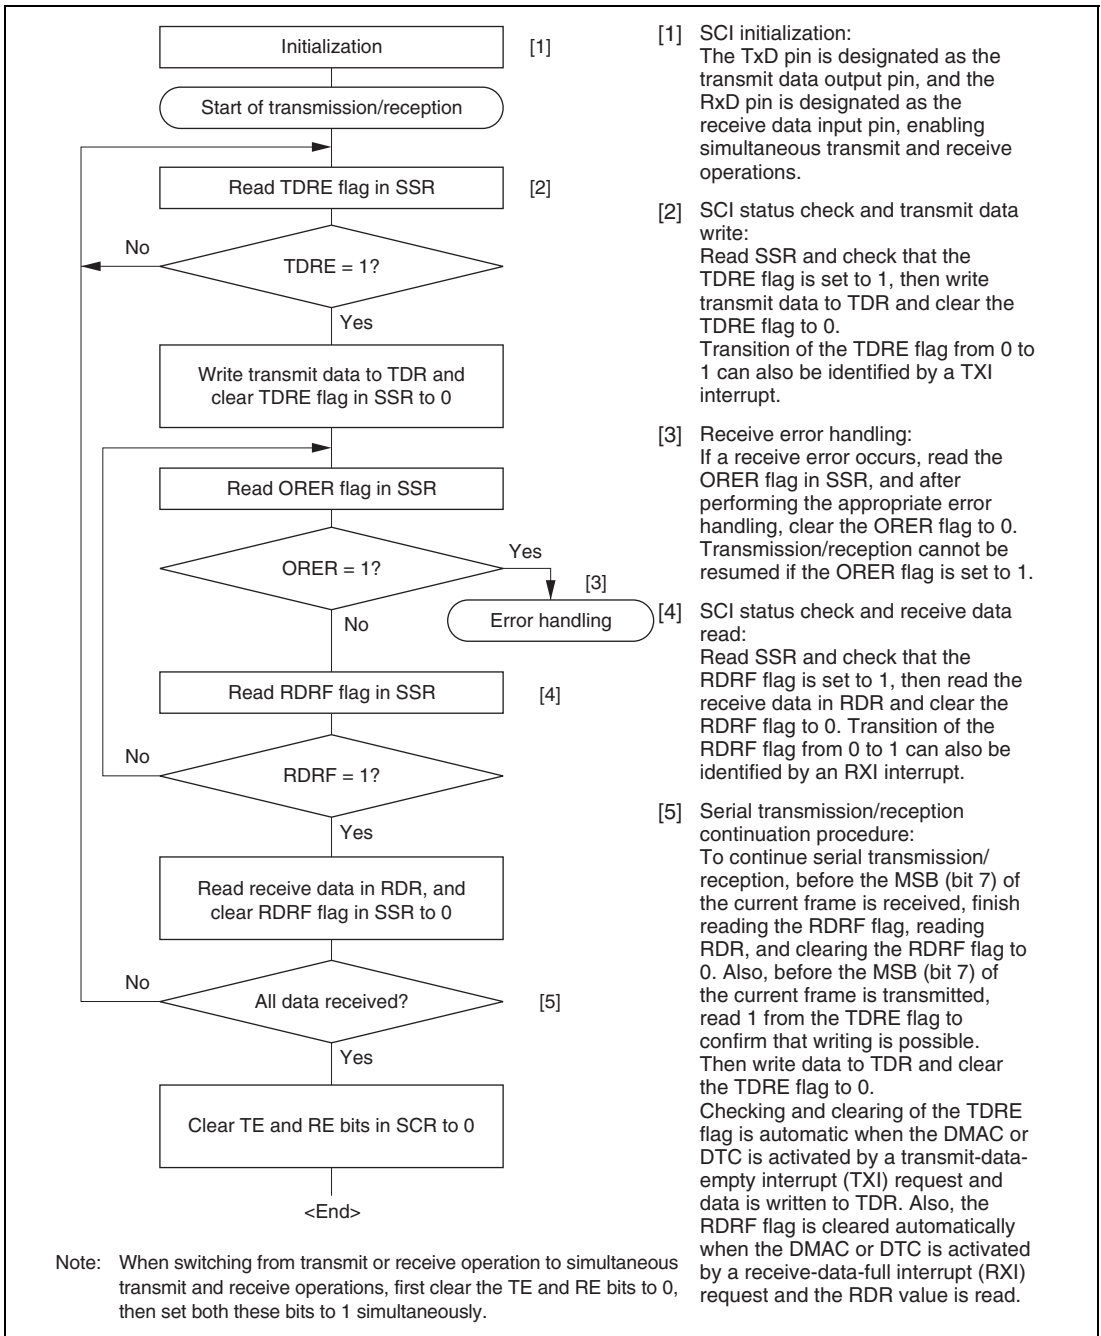

Transfer cannot be resumed while a receive error flag is set to 1. Accordingly, clear the ORER, FER, PER, and RDRF bits to 0 before resuming reception. Figure 15.19 shows a sample flowchart for serial data reception.

**Figure 15.19 Sample Serial Reception Flowchart**

### 15.6.5 Simultaneous Serial Data Transmission and Reception (Clocked Synchronous Mode)

Figure 15.20 shows a sample flowchart for simultaneous serial transmit and receive operations. The following procedure should be used for simultaneous serial data transmit and receive operations after the SCI is initialized. To switch from transmit mode to simultaneous transmit and receive mode, after checking that the SCI has finished transmission and the TDRE and TEND flags are set to 1, clear TE to 0. Then simultaneously set TE and RE to 1 with a single instruction. To switch from receive mode to simultaneous transmit and receive mode, after checking that the SCI has finished reception, clear RE to 0. Then after checking that the RDRF and receive error flags (ORER, FER, and PER) are cleared to 0, simultaneously set TE and RE to 1 with a single instruction.

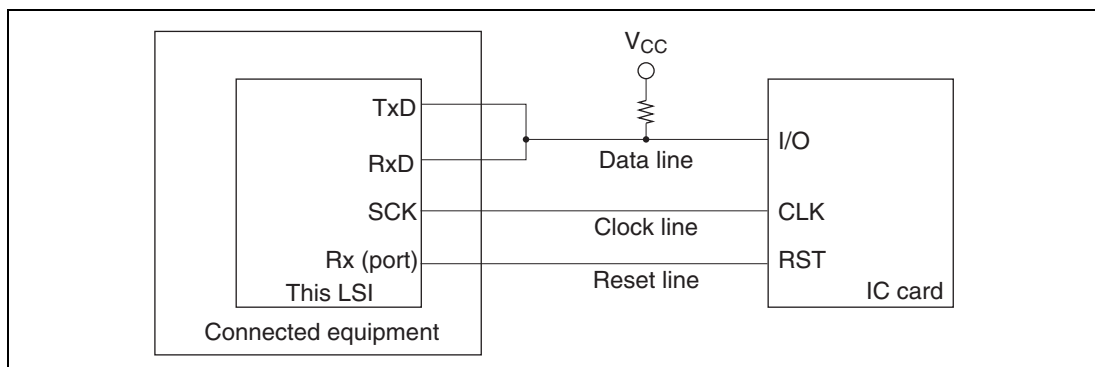

**Figure 15.20 Sample Flowchart of Simultaneous Serial Transmit and Receive Operations**

## 15.7 Operation in Smart Card Interface Mode

The SCI supports an IC card (Smart Card) interface conforming to ISO/IEC 7816-3 (Identification Card) as a serial communication interface extension function. Switching between the normal serial communication interface and the Smart Card interface is carried out by means of a register setting.

### 15.7.1 Pin Connection Example

Figure 15.21 shows an example of connection with the Smart Card. In communication with an IC card, since both transmission and reception are carried out on a single data transmission line, the TxD pin and RxD pin should be connected with the LSI pin. The data transmission line should be pulled up to the  $V_{CC}$  power supply with a resistor. If an IC card is not connected, and the TE and RE bits are both set to 1, closed transmission/reception is possible, enabling self-diagnosis to be carried out. When the clock generated on the SCI is used by an IC card, the SCK pin output is input to the CLK pin of the IC card. This LSI port output is used as the reset signal.

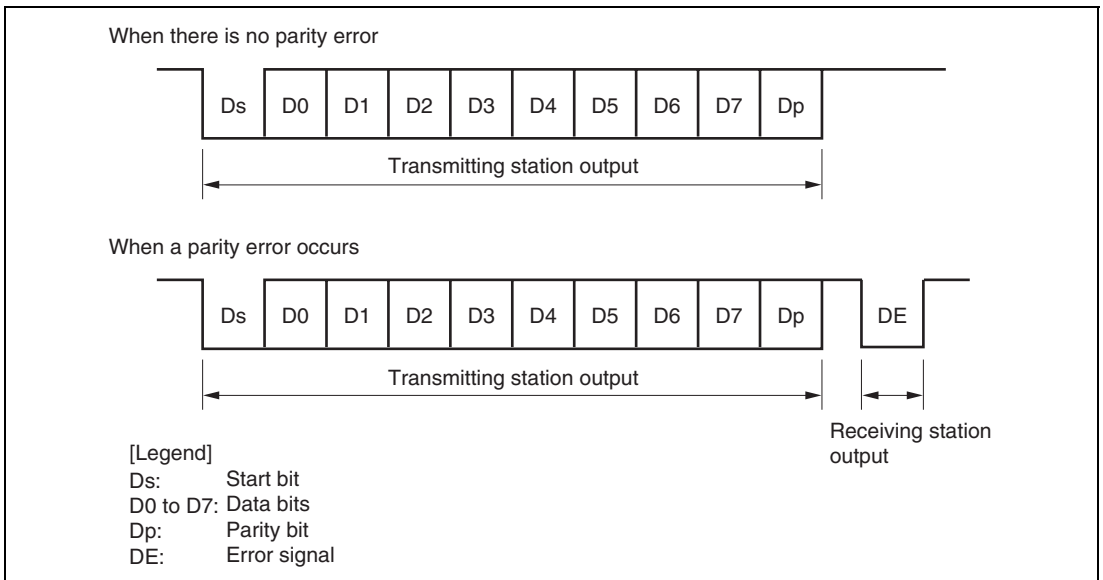

**Figure 15.21 Schematic Diagram of Smart Card Interface Pin Connections**

### 15.7.2 Data Format (Except for Block Transfer Mode)

Figure 15.22 shows the transfer data format in Smart Card interface mode.

- One frame consists of 8-bit data plus a parity bit in asynchronous mode.
- In transmission, a guard time of at least 2 etu (Elementary Time Unit: time for transfer of 1 bit) is left between the end of the parity bit and the start of the next frame.
- If a parity error is detected during reception, a low error signal level is output for one etu period, 10.5 etu after the start bit.
- If an error signal is sampled during transmission, the same data is retransmitted automatically after the elapse of 2 etu or longer.

**Figure 15.22 Normal Smart Card Interface Data Format**

Data transfer with the types of IC cards (direct convention and inverse convention) are performed as described in the following.

**Figure 15.23 Direct Convention (SDIR = SINV =  $O/\bar{E} = 0$ )**

As in the above sample start character, with the direct convention type, the logic 1 level corresponds to state Z and the logic 0 level to state A, and transfer is performed in LSB-first order. The start character data above is H'3B. For the direct convention type, clear the SDIR and SINV bits in SCMR to 0. According to the Smart Card regulations, clear the  $O/\bar{E}$  bit in SMR to 0 to select even parity mode.

**Figure 15.24 Inverse Convention (SDIR = SINV =  $O/\bar{E}$  = 1)**

With the inverse convention type, the logic 1 level corresponds to state A and the logic 0 level to state Z, and transfer is performed in MSB-first order. The start character data above is H'3F. For the inverse convention type, set the SDIR and SINV bits in SCMR to 1. According to the Smart Card regulations, even parity mode is the logic 0 level of the parity bit, and corresponds to state Z. In this LSI, the SINV bit inverts only data bits D7 to D0. Therefore, set the  $O/\bar{E}$  bit in SMR to 1 to invert the parity bit for both transmission and reception.

### 15.7.3 Block Transfer Mode

Operation in block transfer mode is the same as that in normal Smart Card interface, except for the following points.

- In reception, though the parity check is performed, no error signal is output even if an error is detected. However, the PER bit in SSR is set to 1 and must be cleared before receiving the parity bit of the next frame.
- In transmission, a guard time of at least 1 etu is left between the end of the parity bit and the start of the next frame.
- In transmission, because retransmission is not performed, the TEND flag is set to 1, 11.5 etu after transmission start.
- As with the normal Smart Card interface, the ERS flag indicates the error signal status, but since error signal transfer is not performed, this flag is always cleared to 0.

### 15.7.4 Receive Data Sampling Timing and Reception Margin

Only the internal clock generated by the on-chip baud rate generator is used as transmit/receive clock in Smart Card interface. In Smart Card interface mode, the SCI operates on a basic clock with a frequency of 32, 64, 372, 256, 93, 128, 186, or 512 times the bit rate (fixed at 16 times in normal asynchronous mode) as determined by bits BCP2 to BCP0. In reception, the SCI samples the falling edge of the start bit using the basic clock, and performs internal synchronization. As shown in figure 15.25, by sampling receive data at the rising-edge of the 16th, 32nd, 186th, 128th, 46th, 64th, 93rd, or 256th pulse of the basic clock, data can be latched at the middle of the bit. The reception margin is given by the following formula.

$$M = \left| \left( 0.5 - \frac{1}{2N} \right) - (L - 0.5) F - \frac{|D - 0.5|}{N} (1 + F) \right| \times 100 [\%]$$

Where M: Reception margin (%)

N: Ratio of bit rate to clock (N = 32, 64, 372, 256, 93, 128, 186, or 512)

D: Clock duty cycle (D = 0 to 1.0)

L: Frame length (L = 10)

F: Absolute value of clock frequency deviation

Assuming values of F = 0, D = 0.5 and N = 372 in the above formula, the reception margin formula is as follows.

$$\begin{aligned} M &= (0.5 - 1/2 \times 372) \times 100\% \\ &= 49.866\% \end{aligned}$$

**Figure 15.25 Receive Data Sampling Timing in Smart Card Mode  
(Using Clock of 372 Times the Bit Rate)**

### 15.7.5 Initialization

Before transmitting and receiving data, initialize the SCI as described below. Initialization is also necessary when switching from transmit mode to receive mode, or vice versa.

1. Clear the TE and RE bits in SCR to 0.
2. Clear the error flags ERS, PER, and ORER in SSR to 0.
3. Set the GM, BLK,  $O/\bar{E}$ , BCP1, BCP0, CKS1, and CKS0 bits in SMR, and the BCP2 bit in SCMR. Set the PE bit to 1.
4. Set the SMIF, SDIR, and SINV bits in SCMR.  
When the SMIF bit is set to 1, the TxD and RxD pins are both switched from ports to SCI pins, and are placed in the high-impedance state.
5. Set the value corresponding to the bit rate in BRR.
6. Set the CKE0 and CKE1 bits in SCR. Clear the TIE, RIE, TE, RE, MPIE, and TEIE bits to 0.  
If the CKE0 bit is set to 1, the clock is output from the SCK pin.
7. Wait at least one bit interval, then set the TIE, RIE, TE, and RE bits in SCR. Do not set the TE bit and RE bit at the same time, except for self-diagnosis.

To switch from receive mode to transmit mode, after checking that the SCI has finished reception, initialize the SCI, and clear RE to 0 and set TE to 1. Whether SCI has finished reception can be checked with the RDRF, PER, or ORER flag. To switch from transmit mode to receive mode, after checking that the SCI has finished transmission, initialize the SCI, and clear TE to 0 and set RE to 1. Whether SCI has finished transmission can be checked with the TEND flag.

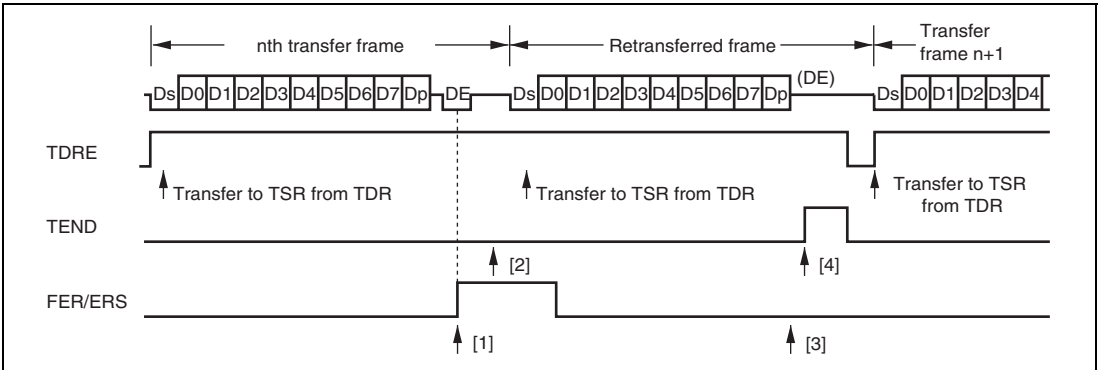

### 15.7.6 Data Transmission (Except for Block Transfer Mode)

As data transmission in Smart Card interface mode involves error signal sampling and retransmission processing, the operations are different from those in normal serial communication interface mode (except for block transfer mode). Figure 15.26 illustrates the retransfer operation when the SCI is in transmit mode.

1. If an error signal is sampled from the receiving end after transmission of one frame is completed, the ERS bit in SSR is set to 1. If the RIE bit in SCR is set at this time, an ERI interrupt request is generated. The ERS bit in SSR should be cleared to 0 before the next parity bit is sampled.
2. The TEND bit in SSR is not set for a frame for which an error signal is received. Data is retransferred from TDR to TSR, and retransmitted automatically.
3. If an error signal is not sent back from the receiving end, the ERS bit in SSR is not set.
4. Transmission of one frame, including a retransfer, is judged to have been completed, and the TEND bit in SSR is set to 1. If the TIE bit in SCR is set at this time, a TXI interrupt request is generated. Writing transmit data to TDR transfers the next transmit data.

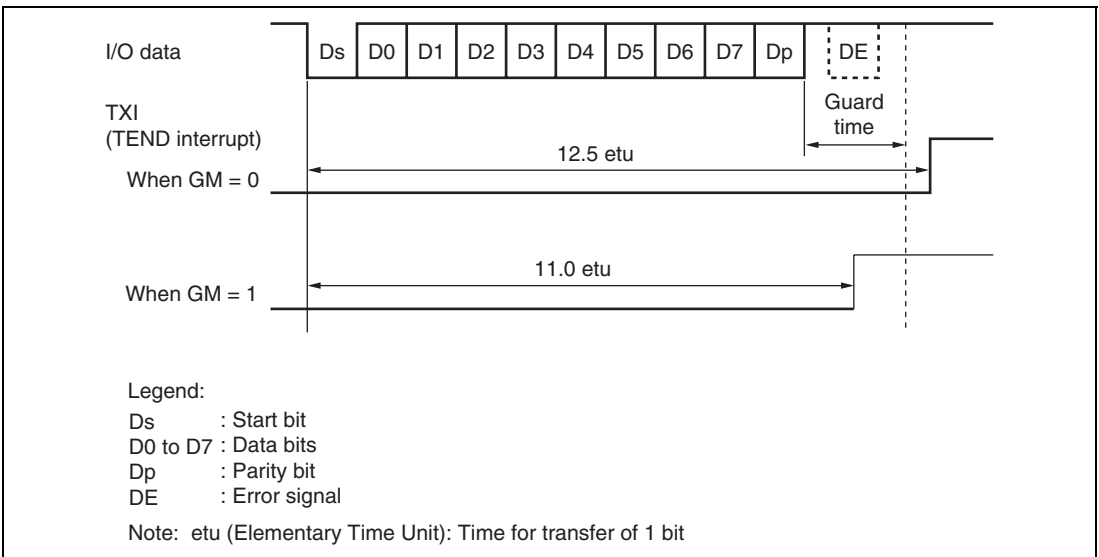

Figure 15.28 shows a flowchart for transmission. The sequence of transmit operations can be performed automatically by specifying the DTC or DMAC to be activated with a TXI interrupt source. In a transmit operation, the TDRE flag is also set to 1 at the same time as the TEND flag in SSR, and a TXI interrupt will be generated if the TIE bit in SCR has been set to 1. If the TXI request is designated beforehand as a DTC or DMAC activation source, the DTC or DMAC will be activated by the TXI request, and transfer of the transmit data will be carried out. The TDRE and TEND flags are automatically cleared to 0 when data transfer is performed by the DTC or DMAC. In the event of an error, the SCI retransmits the same data automatically. During this period, the TEND flag remains cleared to 0 and the DTC or DMAC is not activated. Therefore, the SCI and DTC or DMAC will automatically transmit the specified number of bytes in the event of an error, including retransmission. However, the ERS flag is not cleared automatically when an error occurs, and so the RIE bit should be set to 1 beforehand so that an ERI request will be generated in the event of an error, and the ERS flag will be cleared.

When performing transfer using the DTC or DMAC, it is essential to set and enable the DTC or DMAC before carrying out SCI setting. For details on the DTC or DMAC setting procedures, refer to section 9, Data Transfer Controller (DTC) or section 7, DMA Controller (DMAC).

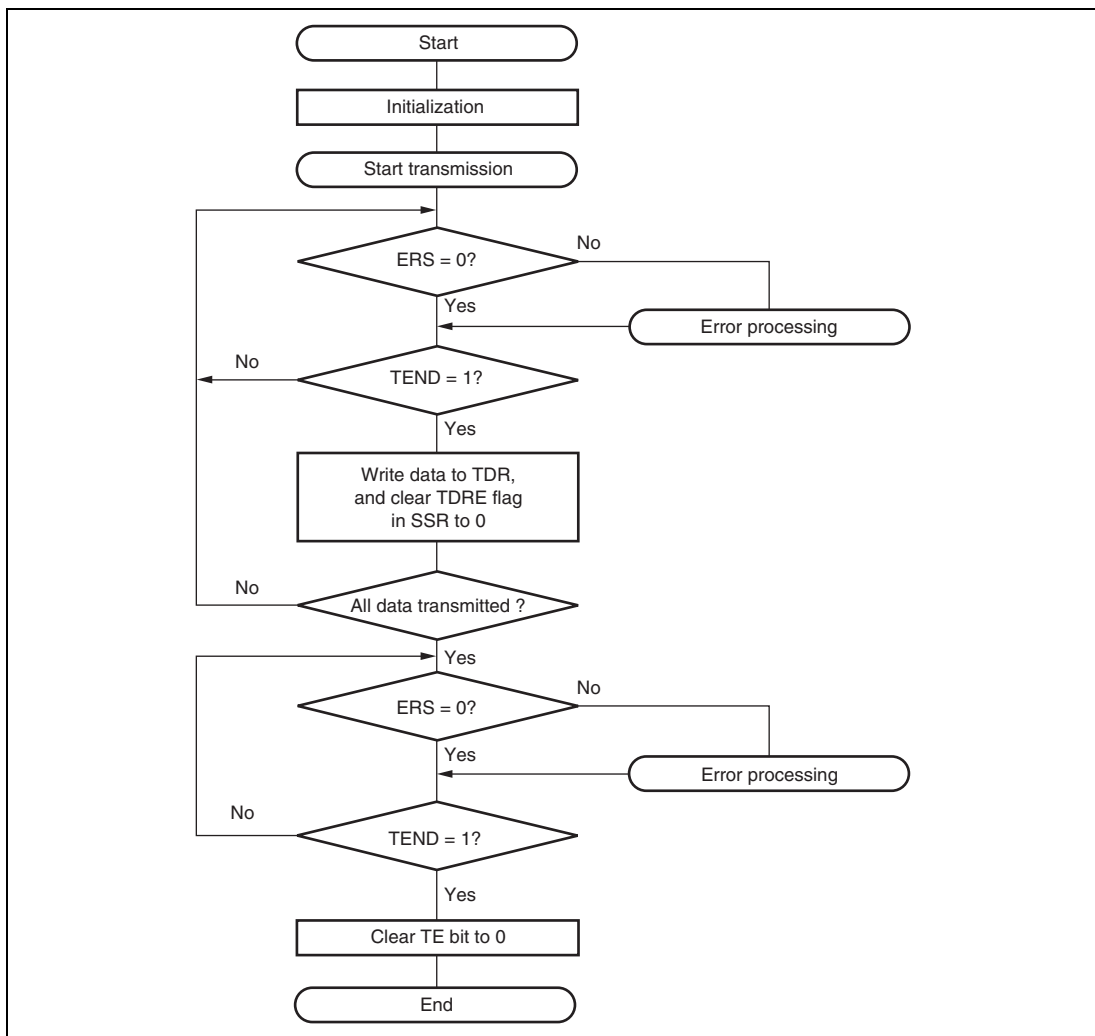

**Figure 15.26 Retransfer Operation in SCI Transmit Mode**

The timing for setting the TEND flag depends on the value of the GM bit in SMR. The TEND flag generation timing is shown in figure 15.27.

**Figure 15.27 TEND Flag Generation Timing in Transmission Operation**

**Figure 15.28 Example of Transmission Processing Flow**

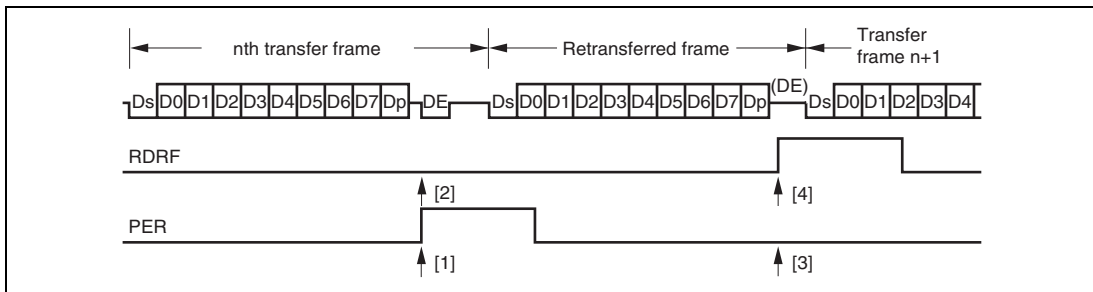

### 15.7.7 Serial Data Reception (Except for Block Transfer Mode)

Data reception in Smart Card interface mode uses the same operation procedure as for normal serial communication interface mode. Figure 15.29 illustrates the retransfer operation when the SCI is in receive mode.

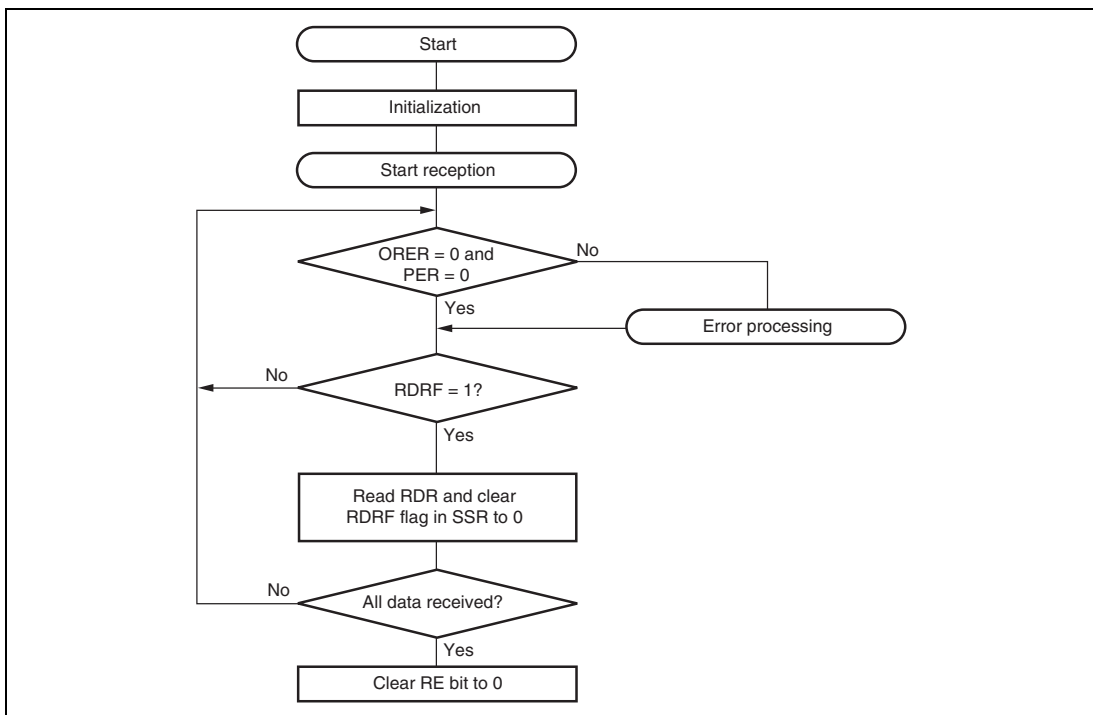

1. If an error is found when the received parity bit is checked, the PER bit in SSR is automatically set to 1. If the RIE bit in SCR is set at this time, an ERI interrupt request is generated. The PER bit in SSR should be cleared to 0 before the next parity bit is sampled.
2. The RDRF bit in SSR is not set for a frame in which an error has occurred.
3. If no error is found when the received parity bit is checked, the PER bit in SSR is not set to 1.
4. The receive operation is judged to have been completed normally, and the RDRF flag in SSR is automatically set to 1. If the RIE bit in SCR is set at this time, an RXI interrupt request is generated.

Figure 15.30 shows a flowchart for reception. The sequence of receive operations can be performed automatically by specifying the DTC or DMAC to be activated with an RXI interrupt source. In a receive operation, an RXI interrupt request is generated when the RDRF flag in SSR is set to 1. If the RXI request is designated beforehand as a DTC or DMAC activation source, the DTC or DMAC will be activated by the RXI request, and transfer of the receive data will be carried out. The RDRF flag is cleared to 0 automatically when data transfer is performed by the DTC or DMAC. If an error occurs in receive mode and the ORER or PER flag is set to 1, a transfer error interrupt (ERI) request will be generated, and so the error flag must be cleared to 0. In the event of an error, the DTC or DMAC is not activated and receive data is skipped. Therefore, receive data is transferred for only the specified number of bytes in the event of an error. Even when a parity error occurs in receive mode and the PER flag is set to 1, the data that has been received is transferred to RDR and can be read from there.

**Note:** For details on receive operations in block transfer mode, refer to section 15.4, Operation in Asynchronous Mode.

**Figure 15.29 Retransfer Operation in SCI Receive Mode**

**Figure 15.30 Example of Reception Processing Flow**

### 15.7.8 Clock Output Control

When the GM bit in SMR is set to 1, the clock output level can be fixed with bits CKE1 and CKE0 in SCR. At this time, the minimum clock pulse width can be made the specified width.

Figure 15.31 shows the timing for fixing the clock output level. In this example, GM is set to 1, CKE1 is cleared to 0, and the CKE0 bit is controlled.

**Figure 15.31 Timing for Fixing Clock Output Level**

When turning on the power or switching between Smart Card interface mode and software standby mode, the following procedures should be followed in order to maintain the clock duty cycle.

**Powering On:** To secure the clock duty cycle from power-on, the following switching procedure should be followed.

1. The initial state is port input and high impedance. Use a pull-up resistor or pull-down resistor to fix the potential.
2. Fix the SCK pin to the specified output level with the CKE1 bit in SCR.
3. Set SMR and SCMR, and switch to Smart Card mode operation.
4. Set the CKE0 bit in SCR to 1 to start clock output.

### When Changing from Smart Card Interface Mode to Software Standby Mode:

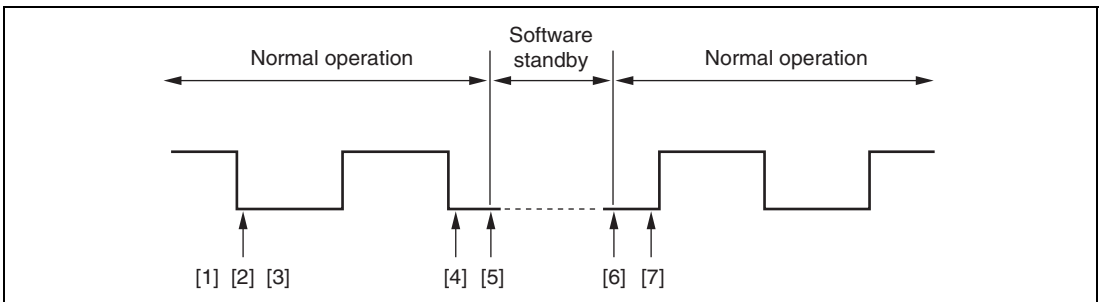

1. Set the data register (DR) and data direction register (DDR) corresponding to the SCK pin to the value for the fixed output state in software standby mode.
2. Write 0 to the TE bit and RE bit in the serial control register (SCR) to halt transmit/receive operation. At the same time, set the CKE1 bit to the value for the fixed output state in software standby mode.
3. Write 0 to the CKE0 bit in SCR to halt the clock.
4. Wait for one serial clock cycle.

During this interval, clock output is fixed at the specified level, with the duty cycle preserved.

5. Make the transition to the software standby state.

### When Returning to Smart Card Interface Mode from Software Standby Mode:

1. Exit the software standby state.
2. Write 1 to the CKE0 bit in SCR and output the clock. Signal generation is started with the normal duty cycle.

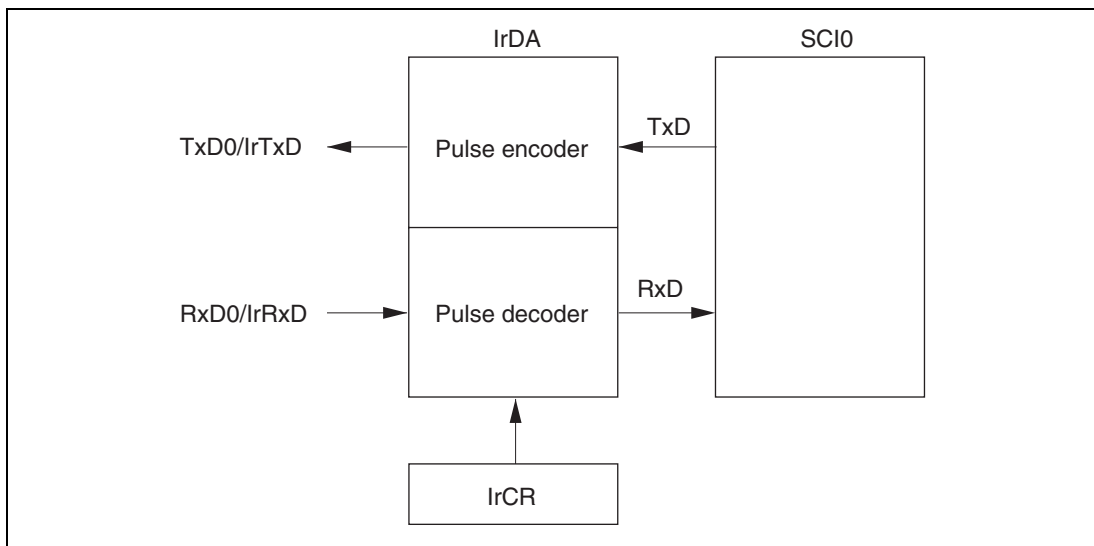

**Figure 15.32 Clock Halt and Restart Procedure**

## 15.8 IrDA Operation

When the IrDA function is enabled with bit IrE in IrCR, the SCI\_0 TxD0 and RxD0 signals are subjected to waveform encoding/decoding conforming to IrDA specification version 1.0 (IrTxD and IrRxD pins). By connecting these pins to an infrared transceiver/receiver, it is possible to implement infrared transmission/reception conforming to the IrDA specification version 1.0 system.

In the IrDA specification version 1.0 system, communication is started at a transfer rate of 9600 bps, and subsequently the transfer rate can be varied as necessary. As the IrDA interface in this LSI does not include a function for varying the transfer rate automatically, the transfer rate setting must be changed by software.

Figure 15.33 shows a block diagram of the IrDA function.

**Figure 15.33 Block Diagram of IrDA**

## (1) Transmission

In transmission, the output signal (UART frame) from the SCI is converted to an IR frame by the IrDA interface (see figure 15.34).

When the serial data is 0, a high pulse of  $3/16$  the bit rate (interval equivalent to the width of one bit) is output (initial value). The high-level pulse can be varied according to the setting of bits IrCKS2 to IrCKS0 in IrCR.

In the specification, the high pulse width is fixed at a minimum of  $1.41 \mu\text{s}$ , and a maximum of  $(3/16 + 2.5\%) \times \text{bit rate}$  or  $(3/16 \times \text{bit rate}) + 1.08 \mu\text{s}$ . When system clock  $\phi$  is 20 MHz,  $1.6 \mu\text{s}$  can be set for a high pulse width with a minimum value of  $1.41 \mu\text{s}$ .

When the serial data is 1, no pulse is output.

**Figure 15.34 IrDA Transmit/Receive Operations**

## (2) Reception

In reception, IR frame data is converted to a UART frame by the IrDA interface, and input to the SCI.

When a high pulse is detected, 0 data is output, and if there is no pulse during a one-bit interval, 1 data is output. Note that a pulse shorter than the minimum pulse width of 1.41  $\mu\text{s}$  will be identified as a 0 signal.

## (3) High Pulse Width Selection

Table 15.12 shows possible settings for bits IrCKS2 to IrCKS0 (minimum pulse width), and operating frequencies of this LSI and bit rates, for making the pulse width shorter than 3/16 times the bit rate in transmission.

**Table 15.12 Settings of IrCKS2 to IrCKS0 Bits**

| Operating Frequency<br>$\phi$ (MHz) | Bit Rate (bps) (Above)/Bit Period $\times$ 3/16 ( $\mu$ s) (Below) |              |             |             |             |             |
|-------------------------------------|--|--------------|-------------|-------------|-------------|-------------|
|                                     | 2400   | 9600         | 19200       | 38400       | 57600       | 115200      |
|                                     | <b>78.13</b>   | <b>19.53</b> | <b>9.77</b> | <b>4.88</b> | <b>3.26</b> | <b>1.63</b> |

[Legend]

—: A bit rate setting cannot be made on the SCI side.

## 15.9 Interrupt Sources

### 15.9.1 Interrupts in Normal Serial Communication Interface Mode

Table 15.13 shows the interrupt sources in normal serial communication interface mode. A different interrupt vector is assigned to each interrupt source, and individual interrupt sources can be enabled or disabled using the enable bits in SCR.

When the TDRE flag in SSR is set to 1, a TXI interrupt request is generated. When the TEND flag in SSR is set to 1, a TEI interrupt request is generated. A TXI interrupt can activate the DTC or DMAC to perform data transfer. The TDRE flag is cleared to 0 automatically when data transfer is performed by the DTC or DMAC.

When the RDRF flag in SSR is set to 1, an RXI interrupt request is generated. When the ORER, PER, or FER flag in SSR is set to 1, an ERI interrupt request is generated. An RXI interrupt request can activate the DTC or DMAC to perform data transfer. The RDRF flag is cleared to 0 automatically when data transfer is performed by the DTC or DMAC.

A TEI interrupt is generated when the TEND flag is set to 1 while the TEIE bit is set to 1. If a TEI interrupt and a TXI interrupt are generated simultaneously, the TXI interrupt has priority for acceptance. However, note that if the TDRE and TEND flags are cleared simultaneously by the TXI interrupt routine, the SCI cannot branch to the TEI interrupt routine later.

## 15.9.2 Interrupts in Smart Card Interface Mode

Table 15.14 shows the interrupt sources in Smart Card interface mode. The transmit end interrupt (TEI) request cannot be used in this mode.

**Table 15.14 Interrupt Sources**

| Channel | Name | Interrupt Source         | Interrupt Flag | DTC Activation | DMAC Activation | Priority |
|---------|------|--------------------------|----------------|----------------|-----------------|----------|
| 0       | ERI0 | Receive Error, detection | ORER, PER, ERS | Not possible   | Not possible    | High     |
|         | RX10 | Receive Data Full        | RDRF           | Possible       | Possible        |          |
|         | TX10 | Transmit Data Empty      | TEND           | Possible       | Possible        |          |
| 1       | ERI1 | Receive Error, detection | ORER, PER, ERS | Not possible   | Not possible    | ↑        |
|         | RX11 | Receive Data Full        | RDRF           | Possible       | Possible        |          |
|         | TX11 | Transmit Data Empty      | TEND           | Possible       | Possible        |          |
| 2       | ERI2 | Receive Error, detection | ORER, PER, ERS | Not possible   | Not possible    | ↑        |
|         | RX12 | Receive Data Full        | RDRF           | Possible       | Not possible    |          |
|         | TX12 | Transmit Data Empty      | TEND           | Possible       | Not possible    |          |
| 3       | ERI3 | Receive Error, detection | ORER, PER, ERS | Not possible   | Not possible    | ↑        |
|         | RX13 | Receive Data Full        | RDRF           | Possible       | Not possible    |          |
|         | TX13 | Transmit Data Empty      | TEND           | Possible       | Not possible    |          |
| 4       | ERI4 | Receive Error, detection | ORER, PER, ERS | Not possible   | Not possible    | ↑        |
|         | RX14 | Receive Data Full        | RDRF           | Possible       | Not possible    |          |
|         | TX14 | Transmit Data Empty      | TEND           | Possible       | Not possible    |          |

In Smart Card interface mode, as in normal serial communication interface mode, transfer can be carried out using the DTC or DMAC. In transmit operations, the TDRE flag is also set to 1 at the same time as the TEND flag in SSR, and a TXI interrupt is generated. If the TXI request is designated beforehand as a DTC or DMAC activation source, the DTC or DMAC will be activated by the TXI request, and transfer of the transmit data will be carried out. The TDRE and TEND flags are automatically cleared to 0 when data transfer is performed by the DTC or DMAC. In the event of an error, the SCI retransmits the same data automatically. During this period, the TEND flag remains cleared to 0 and the DTC or DMAC is not activated. Therefore, the SCI and DTC or DMAC will automatically transmit the specified number of bytes in the event of an error, including retransmission. However, the ERS flag is not cleared automatically when an error occurs, and so the RIE bit should be set to 1 beforehand so that an ERI request will be generated in the event of an error, and the ERS flag will be cleared.

When performing transfer using the DTC or DMAC, it is essential to set and enable the DTC or DMAC before carrying out SCI setting. For details on the DTC or DMAC setting procedures, refer to section 9, Data Transfer Controller (DTC) or section 7, DMA Controller (DMAC).

In receive operations, an RXI interrupt request is generated when the RDRF flag in SSR is set to 1. If the RXI request is designated beforehand as a DTC or DMAC activation source, the DTC or DMAC will be activated by the RXI request, and transfer of the receive data will be carried out. The RDRF flag is cleared to 0 automatically when data transfer is performed by the DTC or DMAC. If an error occurs, an error flag is set but the RDRF flag is not. Consequently, the DTC or DMAC is not activated, but instead, an ERI interrupt request is sent to the CPU. Therefore, the error flag should be cleared.

## 15.10 Usage Notes

### 15.10.1 Module Stop Function Setting

SCI operation can be disabled or enabled using the module stop control register. The initial setting is for SCI operation to be halted. Register access is enabled by clearing the module stop state. For details, refer to section 23, Power-Down Modes.

### 15.10.2 Break Detection and Processing

When framing error detection is performed, a break can be detected by reading the RxD pin value directly. In a break, the input from the RxD pin becomes all 0s, and so the FER flag is set, and the PER flag may also be set. Note that, since the SCI continues the receive operation after receiving a break, even if the FER flag is cleared to 0, it will be set to 1 again.

### 15.10.3 Mark State and Break Sending

When TE is 0, the TxD pin is used as an I/O port whose direction (input or output) and level are determined by DR and DDR. This can be used to set the TxD pin to mark state or send a break during serial data transmission. To maintain the communication line at mark state until TE is set to 1, set both DDR and DR to 1. Since TE is cleared to 0 at this point, the TxD pin becomes an I/O port, and 1 is output from the TxD pin. To send a break during serial transmission, first set DDR to 1 and clear DR to 0, and then clear TE to 0. When TE is cleared to 0, the transmitter is initialized regardless of the current transmission state, the TxD pin becomes an I/O port, and 0 is output from the TxD pin.

### 15.10.4 Receive Error Flags and Transmit Operations (Clocked Synchronous Mode Only)

Transmission cannot be started when a receive error flag (ORER, PER, or FER) is set to 1, even if the TDRE flag is cleared to 0. Be sure to clear the receive error flags to 0 before starting transmission. Note also that receive error flags cannot be cleared to 0 even if the RE bit is cleared to 0.

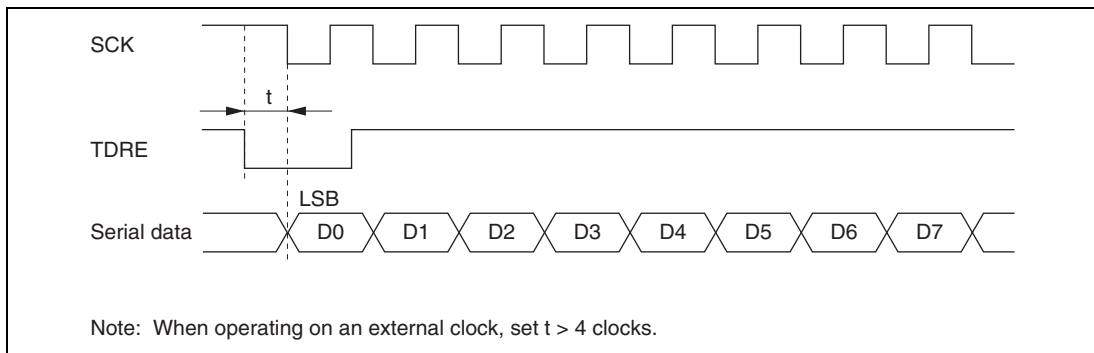

### 15.10.5 Relation between Writes to TDR and the TDRE Flag

The TDRE flag in SSR is a status flag that indicates that transmit data has been transferred from TDR to TSR. When the SCI transfers data from TDR to TSR, the TDRE flag is set to 1.

Data can be written to TDR regardless of the state of the TDRE flag. However, if new data is written to TDR when the TDRE flag is cleared to 0, the data stored in TDR will be lost since it has not yet been transferred to TSR. It is therefore essential to check that the TDRE flag is set to 1 before writing transmit data to TDR.

### 15.10.6 Restrictions on Use of DMAC or DTC

- When an external clock source is used as the serial clock, the transmit clock should not be input until at least 5  $\phi$  clock cycles after TDR is updated by the DMAC or DTC. Incorrect operation may occur if the transmit clock is input within 4  $\phi$  clocks after TDR is updated. (Figure 15.35)
- When RDR is read by the DMAC or DTC, be sure to set the activation source to the relevant SCI receive-data-full interrupt (RXI).

**Figure 15.35 Example of Synchronous Transmission Using DTC**

### 15.10.7 Operation in Case of Mode Transition

- Transmission

Operation should be stopped (by clearing TE, TIE, and TEIE to 0) before setting the module stop state or making a transition to software standby mode. TSR, TDR, and SSR are reset. The output pin states in the module stop state or software standby mode depend on the port settings, and become high-level output after the relevant mode is cleared. If a transition is made during transmission, the data being transmitted will be undefined.

When transmitting without changing the transmit mode after the relevant mode is cleared, transmission can be started by setting TE to 1 again, and performing the following sequence: SSR read → TDR write → TDRE clearance. To transmit with a different transmit mode after clearing the relevant mode, the procedure must be started again from initialization.

Figure 15.36 shows a sample flowchart for mode transition during transmission. Port pin states during mode transition are shown in figures 15.37 and 15.38.

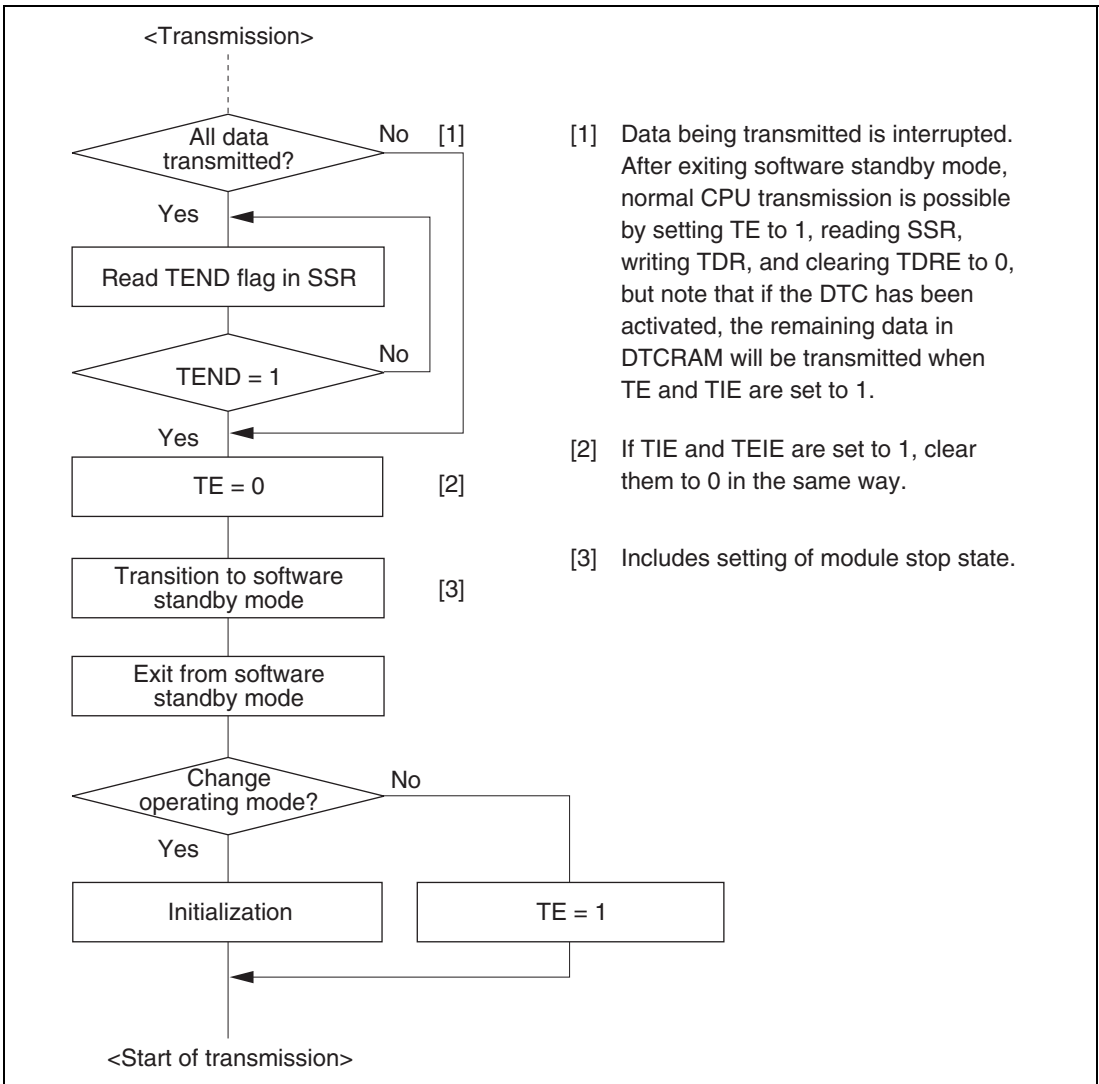

Operation should also be stopped (by clearing TE, TIE, and TEIE to 0) before making a transition from transmission by DTC transfer to module stop state setting or software standby mode transition. To perform transmission with the DTC after the relevant mode is cleared, setting TE and TIE to 1 will set the TXI flag and start DTC transmission.

- Reception

Receive operation should be stopped (by clearing RE to 0) before setting the module stop state or making a transition to software standby mode. RSR, RDR, and SSR are reset. If a transition is made during reception, the data being received will be invalid.

To continue receiving without changing the reception mode after the relevant mode is cleared, set RE to 1 before starting reception. To receive with a different receive mode, the procedure must be started again from initialization.

Figure 15.39 shows a sample flowchart for mode transition during reception.

**Figure 15.36 Sample Flowchart for Mode Transition during Transmission**

**Figure 15.37 Port Pin States during Mode Transition (Internal Clock, Asynchronous Transmission)**

**Figure 15.39 Sample Flowchart for Mode Transition during Reception**

## Section 16 I<sup>2</sup>C Bus Interface 2 (IIC2)

This LSI has a four-channel I<sup>2</sup>C bus interface.

The I<sup>2</sup>C bus interface conforms to and provides a subset of the NXP I<sup>2</sup>C bus (inter-IC bus) interface functions (Rev. 0.3) for standard-mode and fast-mode. The register configuration that controls the I<sup>2</sup>C bus differs partly from the NXP configuration, however.

Figure 16.1 shows a block diagram of the I<sup>2</sup>C bus interface 2. Figure 16.2 shows an example of I/O pin connections to external circuits.

### 16.1 Features

- Continuous transmission/reception  
Since the shift register, transmit data register, and receive data register are independent from each other, the continuous transmission/reception can be performed.
- Start and stop conditions generated automatically in master mode
- Selection of acknowledge output levels when receiving
- Automatic loading of acknowledge bit when transmitting
- Bit synchronization/wait function  
In master mode, the state of SCL is monitored per bit, and the timing is synchronized automatically. If transmission/reception is not yet possible, set the SCL to low until preparations are completed.
- Six interrupt sources  
Transmit-data-empty (including slave-address match), transmit-end, receive-data-full (including slave-address match), arbitration lost, NACK detection, and stop condition detection
- Direct bus drive  
Two pins, SCL and SDA pins function as NMOS open-drain outputs.

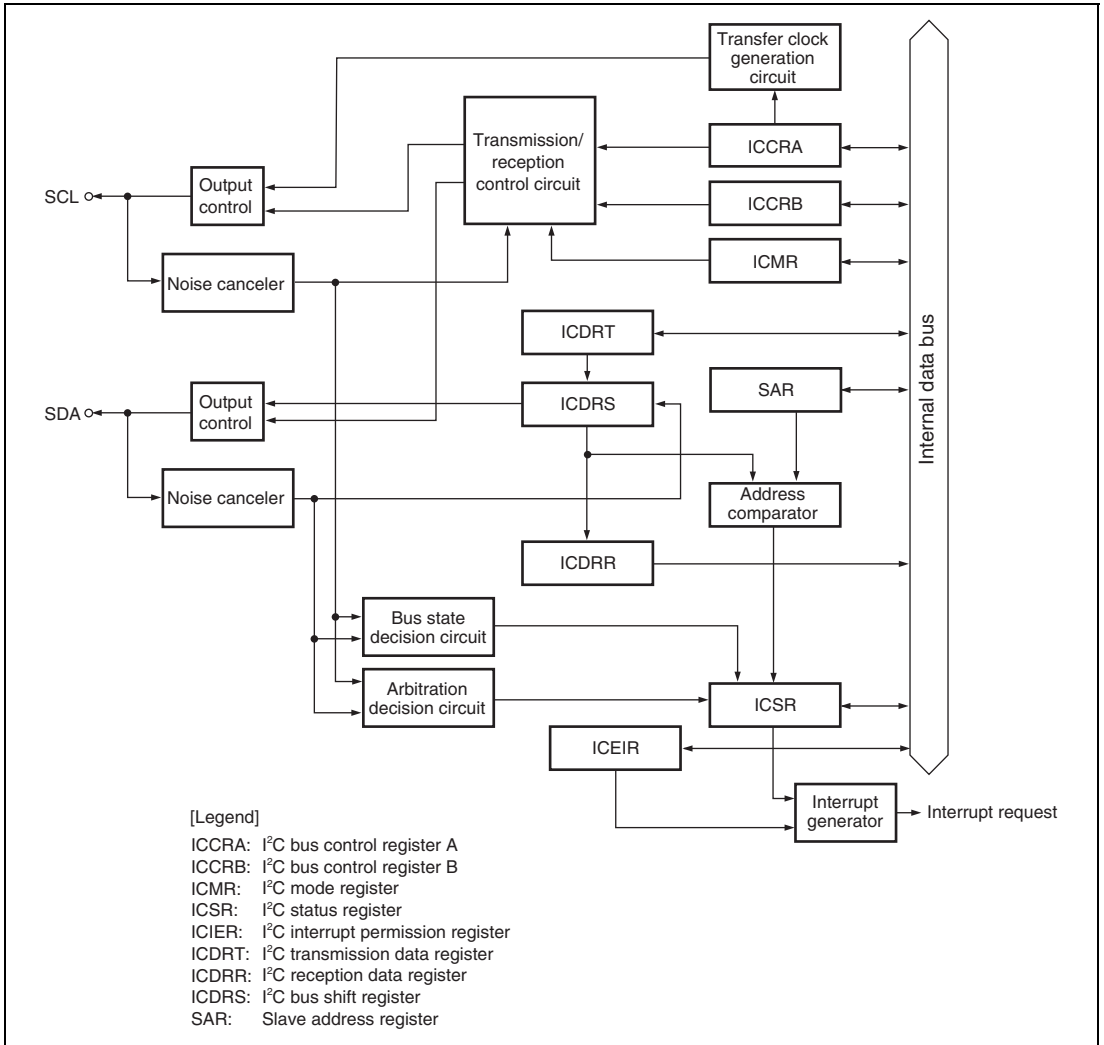

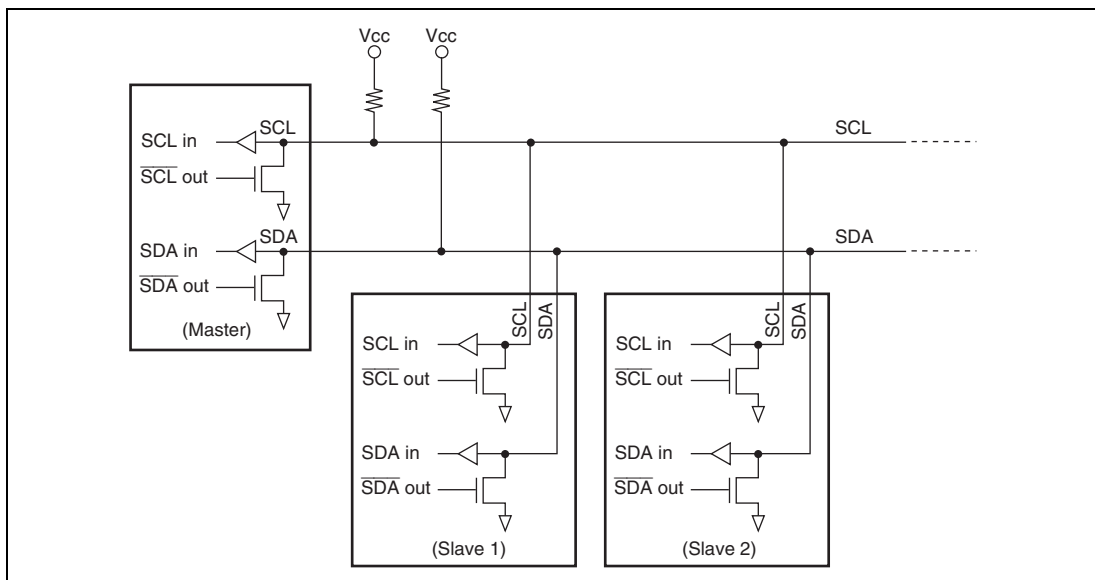

Figure 16.1 Block Diagram of I<sup>2</sup>C Bus Interface 2

**Figure 16.2 External Circuit Connections of I/O Pins**

## 16.2 Input/Output Pins

Table 16.1 shows the pin configuration of the I<sup>2</sup>C bus interface 2.

**Table 16.1 Pin Configuration**

| Name             | Abbreviation | I/O | Function                         |
|------------------|--------------|-----|----------------------------------|
| Serial clock pin | SCL0         | I/O | IIC2_0 serial clock input/output |
| Serial data pin  | SDA0         | I/O | IIC2_0 serial data input/output  |
| Serial clock pin | SCL1         | I/O | IIC2_1 serial clock input/output |
| Serial data pin  | SDA1         | I/O | IIC2_1 serial data input/output  |
| Serial clock pin | SCL2         | I/O | IIC2_2 serial clock input/output |
| Serial data pin  | SDA2         | I/O | IIC2_2 serial data input/output  |
| Serial clock pin | SCL3         | I/O | IIC2_3 serial clock input/output |
| Serial data pin  | SDA3         | I/O | IIC2_3 serial data input/output  |

Note: The pin symbols are represented as SCL and SDA; channel numbers are omitted in this manual.

## 16.3 Register Descriptions

The I<sup>2</sup>C bus interface has the following registers.

### Channel 0

- I<sup>2</sup>C bus control register A\_0 (ICCRA\_0)
- I<sup>2</sup>C bus control register B\_0 (ICCRB\_0)
- I<sup>2</sup>C bus mode register\_0 (ICMR\_0)
- I<sup>2</sup>C bus interrupt enable register\_0 (ICIER\_0)
- I<sup>2</sup>C bus status register\_0 (ICSR\_0)
- Slave address register\_0 (SAR\_0)
- I<sup>2</sup>C bus transmit data register\_0 (ICDRT\_0)
- I<sup>2</sup>C bus receive data register\_0 (ICDRR\_0)
- I<sup>2</sup>C bus shift register\_0 (ICDRS\_0)

### Channel 1

- I<sup>2</sup>C bus control register A\_1 (ICCRA\_1)
- I<sup>2</sup>C bus control register B\_1 (ICCRB\_1)
- I<sup>2</sup>C bus mode register\_1 (ICMR\_1)
- I<sup>2</sup>C bus interrupt enable register\_1 (ICIER\_1)
- I<sup>2</sup>C bus status register\_1 (ICSR\_1)
- Slave address register\_1 (SAR\_1)
- I<sup>2</sup>C bus transmit data register\_1 (ICDRT\_1)
- I<sup>2</sup>C bus receive data register\_1 (ICDRR\_1)
- I<sup>2</sup>C bus shift register\_1 (ICDRS\_1)

## Channel 2

- I<sup>2</sup>C bus control register A\_2 (ICCRA\_2)
- I<sup>2</sup>C bus control register B\_2 (ICCRB\_2)
- I<sup>2</sup>C bus mode register\_2 (ICMR\_2)
- I<sup>2</sup>C bus interrupt enable register\_2 (ICIER\_2)
- I<sup>2</sup>C bus status register\_2 (ICSR\_2)
- Slave address register\_2 (SAR\_2)
- I<sup>2</sup>C bus transmit data register\_2 (ICDRT\_2)
- I<sup>2</sup>C bus receive data register\_2 (ICDRR\_2)
- I<sup>2</sup>C bus shift register\_2 (ICDRS\_2)

## Channel 3

- I<sup>2</sup>C bus control register A\_3 (ICCRA\_3)
- I<sup>2</sup>C bus control register B\_3 (ICCRB\_3)
- I<sup>2</sup>C bus mode register\_3 (ICMR\_3)
- I<sup>2</sup>C bus interrupt enable register\_3 (ICIER\_3)
- I<sup>2</sup>C bus status register\_3 (ICSR\_3)
- Slave address register\_3 (SAR\_3)
- I<sup>2</sup>C bus transmit data register\_3 (ICDRT\_3)
- I<sup>2</sup>C bus receive data register\_3 (ICDRR\_3)
- I<sup>2</sup>C bus shift register\_3 (ICDRS\_3)

### 16.3.1 I<sup>2</sup>C Bus Control Register A (ICCRA)

ICCRA is an 8-bit readable/writable register that enables or disables the I<sup>2</sup>C bus interface, controls transmission or reception, and selects master or slave mode, transmission or reception, and transfer clock frequency in master mode.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | ICE      | 0             | R/W | <p>I<sup>2</sup>C Bus Interface Enable</p> <p>0: Disables SCL/SDA outputs. (Inputs to SCL/SDA are available.)</p> <p>1: This module is enabled for transfer operations. (SCL and SDA pins are bus drive state.)</p>   |
| 6   | RCVD     | 0             | R/W | <p>Reception Disable</p> <p>This bit enables or disables the next operation when TRS is 0 and ICDRR is read.</p> <p>0: Enables next reception.</p> <p>1: Disables next reception.</p>   |
| 5   | MST      | 0             | R/W | Master/Slave Select   |
| 4   | TRS      | 0             | R/W | <p>Transmit/Receive Select</p> <p>When arbitration is lost in master mode, MST and TRS are both reset by hardware, causing a transition to slave receive mode. Modification of the TRS bit should be made between transfer frames. In addition, TRS is set to 1 automatically in slave receive mode if the seventh bit of the start condition matches the slave address set in SAR and the eighth bit is set to 1.</p> <p>Operating modes are described below according to MST and TRS combination.</p> <p>00: Slave receive mode</p> <p>01: Slave transmit mode</p> <p>10: Master receive mode</p> <p>11: Master transmit mode</p> |
| 3   | CKS3     | 0             | R/W | Transfer Clock Select 3 to 0  |
| 2   | CKS2     | 0             | R/W | <p>In the master mode, these bits should be set according to the necessary transfer rate (see table 16.2). In the slave mode, they are used to secure the data setup time in transmit mode. The data setup time is 10 t<sub>cy</sub> if CKS3 is cleared to 0 and 20 t<sub>cy</sub> if CKS3 is set to 1.</p>   |
| 1   | CKS1     | 0             | R/W |   |
| 0   | CKS0     | 0             | R/W |   |

**Table 16.2 Transfer Rate**

| Bit 3 | Bit 2 | Bit 1 | Bit 0 | Transfer Rate |                        |                         |                         |                         |                         |
|-------|-------|-------|-------|---------------|------------------------|-------------------------|-------------------------|-------------------------|-------------------------|
|       |       |       |       | Clock         | $\phi = 8 \text{ MHz}$ | $\phi = 10 \text{ MHz}$ | $\phi = 20 \text{ MHz}$ | $\phi = 25 \text{ MHz}$ | $\phi = 33 \text{ MHz}$ |
| 0     | 0     | 0     | 0     | $\phi/28$     | 286 kHz                | 357 kHz                 | 714 kHz*                | 893 kHz*                | 1179 kHz*               |
|       |       |       | 1     | $\phi/40$     | 200 kHz                | 250 kHz                 | 500 kHz*                | 625 kHz*                | 825 kHz*                |
|       |       | 1     | 0     | $\phi/48$     | 167 kHz                | 208 kHz                 | 417 kHz*                | 521 kHz*                | 688 kHz*                |
|       |       |       | 1     | $\phi/64$     | 125 kHz                | 156 kHz                 | 313 kHz                 | 391 kHz                 | 516 kHz*                |
|       | 1     | 0     | 0     | $\phi/168$    | 47.6 kHz               | 59.5 kHz                | 119 kHz                 | 149 kHz                 | 196 kHz                 |
|       |       |       | 1     | $\phi/100$    | 80.0 kHz               | 100 kHz                 | 200 kHz                 | 250 kHz                 | 330 kHz                 |
|       |       | 1     | 0     | $\phi/112$    | 71.4 kHz               | 89.3 kHz                | 179 kHz                 | 223 kHz                 | 295 kHz                 |
|       |       |       | 1     | $\phi/128$    | 62.5 kHz               | 78.1 kHz                | 156 kHz                 | 195 kHz                 | 258 kHz                 |
| 1     | 0     | 0     | 0     | $\phi/56$     | 143 kHz                | 179 kHz                 | 357 kHz                 | 446 kHz*                | 589 kHz*                |
|       |       |       | 1     | $\phi/80$     | 100 kHz                | 125 kHz                 | 250 kHz                 | 313 kHz                 | 413 kHz*                |
|       |       | 1     | 0     | $\phi/96$     | 83.3 kHz               | 104 kHz                 | 208 kHz                 | 260 kHz                 | 344 kHz                 |
|       |       |       | 1     | $\phi/128$    | 62.5 kHz               | 78.1 kHz                | 156 kHz                 | 195 kHz                 | 258 kHz                 |
|       | 1     | 0     | 0     | $\phi/336$    | 23.8 kHz               | 29.8 kHz                | 59.5 kHz                | 74.4 kHz                | 98.2 kHz                |
|       |       |       | 1     | $\phi/200$    | 40.0 kHz               | 50.0 kHz                | 100 kHz                 | 125 kHz                 | 165 kHz                 |
|       |       | 1     | 0     | $\phi/224$    | 35.7 kHz               | 44.6 kHz                | 89.3 kHz                | 112 kHz                 | 147 kHz                 |
|       |       |       | 1     | $\phi/256$    | 31.3 kHz               | 39.1 kHz                | 78.1 kHz                | 97.7 kHz                | 129 kHz                 |

Note: \* Correct operation cannot be guaranteed since the transfer rate is beyond the I<sup>2</sup>C bus interface specification (normal mode: maximum 100 kHz, high-speed mode: maximum 400 kHz).

### 16.3.2 I<sup>2</sup>C Bus Control Register B (ICCRB)

ICCRB is an 8-bit readable/writable register that issues start/stop conditions, manipulates the SDA pin, monitors the SCL pin, and controls reset in I<sup>2</sup>C control.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | BBSY     | 0             | R/W | <p>Bus Busy</p> <p>This bit enables to confirm whether the I<sup>2</sup>C bus is occupied or released and to issue start and stop conditions in master mode. This bit is set to 1 when the SDA level changes from high to low under the condition of SCL = high, assuming that the start condition has been issued. This bit is cleared to 0 when the SDA level changes from low to high under the condition of SCL = high, assuming that the stop condition has been issued. Write 1 to BBSY and 0 to SCP to issue a start condition. Follow this procedure when also re-transmitting a start condition. Write 0 to BBSY and 0 to SCP to issue a stop condition. To issue a start/stop condition, use the MOV instruction.</p> |
| 6   | SCP      | 1             | R/W | <p>Start Condition/Stop Condition Prohibit</p> <p>The SCP bit controls the issue of start/stop conditions in master mode.</p> <p>To issue a start condition, write 1 in BBSY and 0 in SCP. A retransmit start condition is issued in the same way. To issue a stop condition, write 0 in BBSY and 0 in SCP. This bit is always read as 1. If 1 is written, the data is not stored.</p>  |
| 5   | SDAO     | 1             | R   | <p>This bit monitors SDA output level. When reading and SDA0 is 1, the SDA pin outputs high. When reading and SDA0 is 0, the SDA pin outputs low.</p> <p>The write value should always be 1.</p>  |
| 4   | —        | 1             | R/W | <p>Reserved</p> <p>The write value should always be 1.</p>  |
| 3   | SCLO     | 1             | R   | <p>This bit monitors SCL output level. When reading and SCLO is 1, the SCL pin outputs high. When reading and SCLO is 0, the SCL pin outputs low.</p>   |
| 2   | —        | 1             | —   | <p>Reserved</p> <p>This bit is always read as 1.</p>  |

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 1   | IICRST   | 0             | R/W | IIC Control Part Reset<br>This bit resets control parts except for I <sup>2</sup> C registers. If this bit is set to 1 when hang-up is occurred because of communication failure during I <sup>2</sup> C operation, I <sup>2</sup> C control part can be reset without setting ports and initializing registers. |
| 0   | —        | 1             | —   | Reserved<br>This bit is always read as 1.  |

### 16.3.3 I<sup>2</sup>C Bus Mode Register (ICMR)

ICMR controls the master mode wait and selects the number of transfer bits.

| Bit  | Bit Name | Initial Value | R/W | Description   |
|------|----------|---------------|-----|---|
| 7    | —        | 0             | —   | Reserved<br>The write value should always be 0.   |
| 6    | WAIT     | 0             | R/W | Wait Insertion<br>This bit selects whether to insert a wait after data transfer except for the acknowledge bit. When WAIT is set to 1, after the fall of the clock for the final data bit, low period is extended for two transfer clocks. If WAIT is cleared to 0, data and acknowledge bits are transferred consecutively with no wait inserted.<br>The setting of this bit is invalid in slave mode. |
| 5, 4 | —        | All 1         | —   | Reserved<br>These bits are always read as 1.  |
| 3    | BCWP     | 1             | R/W | BC Write Protect<br>This bit controls the BC2 to BC0 modifications. When modifying BC2 to BC0, this bit should be cleared to 0 and use the MOV instruction.<br>0: When writing, values of BC2 to BC0 are set.<br>1: When reading, 1 is always read.<br>When writing, settings of BC2 to BC0 are invalid.  |

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 2   | BC2      | 0             | R/W | Bit Counter 2 to 0   |
| 1   | BC1      | 0             | R/W | <p>These bits specify the number of bits to be transferred next. When read, the remaining number of transfer bits is indicated. The data is transferred with one addition acknowledge bit. Bit BC2 to BC0 settings should be made during an interval between transfer frames. If bits BC2 to BC0 are set to a value other than 000, the setting should be made while the SCL line is low. The value returns to 000 at the end of a data transfer, including the acknowledge bit.</p> <p>000: 9 bits<br/>           001: 2 bits<br/>           010: 3 bits<br/>           011: 4 bits<br/>           100: 5 bits<br/>           101: 6 bits<br/>           110: 7 bits<br/>           111: 8 bits</p> |
| 0   | BC0      | 0             | R/W |  |

### 16.3.4 I<sup>2</sup>C Bus Interrupt Enable Register (ICIER)

ICIER is an 8-bit readable/writable register that enables or disables interrupt sources and acknowledge bits, sets acknowledge bits to be transferred, and confirms acknowledge bits to be received.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | TIE      | 0             | R/W | <p>Transmit Interrupt Enable</p> <p>When the TDRE bit in ICSR is set to 1, this bit enables or disables the transmit data empty interrupt (TXI).</p> <p>0: Transmit data empty interrupt request (TXI) is disabled.</p> <p>1: Transmit data empty interrupt request (TXI) is enabled.</p>  |
| 6   | TEIE     | 0             | R/W | <p>Transmit End Interrupt Enable</p> <p>This bit enables or disables the transmit end interrupt (TEI) at the rising of the ninth clock while the TDRE bit in ICSR is 1. TEI can be canceled by clearing the TEND bit or the TEIE bit to 0.</p> <p>0: Transmit end interrupt request (TEI) is disabled.</p> <p>1: Transmit end interrupt request (TEI) is enabled.</p>                                      |
| 5   | RIE      | 0             | R/W | <p>Receive Interrupt Enable</p> <p>This bit enables or disables the receive data full interrupt request (RXI) when a received data is transferred from ICDRS to ICDRR and the RDRF bit in ICSR is set to 1. RXI can be canceled by clearing the RDRF or RIE bit to 0.</p> <p>0: Receive data full interrupt request (RXI) is disabled.</p> <p>1: Receive data full interrupt request (RXI) is enabled.</p> |

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 4   | NAKIE    | 0             | R/W | <p>NACK Receive Interrupt Enable</p> <p>This bit enables or disables the NACK receive interrupt request (NAKI) when the NACKF and AL bits in ICSR are set to 1. NAKI can be canceled by clearing the NACKF, AL, or NAKIE bit to 0.</p> <p>0: NACK receive interrupt request (NAKI) is disabled.</p> <p>1: NACK receive interrupt request (NAKI) is enabled.</p> |
| 3   | STIE     | 0             | R/W | <p>Stop Condition Detection Interrupt Enable</p> <p>0: Stop condition detection interrupt request (STPI) is disabled.</p> <p>1: Stop condition detection interrupt request (STPI) is enabled.</p>   |
| 2   | ACKE     | 0             | R/W | <p>Acknowledge Bit Judgement Select</p> <p>0: The value of the acknowledge bit is ignored, and continuous transfer is performed.</p> <p>1: If the acknowledge bit is 1, continuous transfer is interrupted.</p>   |
| 1   | ACKBR    | 0             | R   | <p>Receive Acknowledge</p> <p>In transmit mode, this bit stores the acknowledge data that are returned by the receive device. This bit cannot be modified.</p> <p>0: Receive acknowledge = 0</p> <p>1: Receive acknowledge = 1</p>  |
| 0   | ACKBT    | 0             | R/W | <p>Transmit Acknowledge</p> <p>In receive mode, this bit specifies the bit to be sent at the acknowledge timing.</p> <p>0: 0 is sent at the acknowledge timing.</p> <p>1: 1 is sent at the acknowledge timing.</p>  |

### 16.3.5 I<sup>2</sup>C Bus Status Register (ICSR)

ICSR is an 8-bit readable/writable register that performs confirmation of interrupt request flags and status.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | TDRE     | 0             | R/W | Transmit Data Register Empty<br>[Setting condition] <ul style="list-style-type: none"> <li>• When data is transferred from ICDRT to ICDRS and ICDRT becomes empty.</li> <li>• When TRS has been set.</li> <li>• When a start condition (including retransmission) has been issued.</li> <li>• When a transition from the receive mode to the transmit mode has been made in the slave mode.</li> <li>• [Clearing conditions]</li> <li>• When 0 is written in TDRE after reading TDRE = 1.</li> <li>• When data is written in ICDRT.</li> </ul> |
| 6   | TEND     | 0             | R/W | Transmit End<br>[Setting condition] <ul style="list-style-type: none"> <li>• When the ninth clock of SCL is rose while the TDRE flag is 1.</li> </ul> [Clearing conditions] <ul style="list-style-type: none"> <li>• When 0 is written in TEND after reading TEND = 1.</li> <li>• When data is written in ICDRT.</li> </ul>  |
| 5   | RDRF     | 0             | R/W | Receive Data Register Full<br>[Setting condition] <ul style="list-style-type: none"> <li>• When a received data is transferred from ICDRS to ICDRR.</li> </ul> [Clearing conditions] <ul style="list-style-type: none"> <li>• When 0 is written in RDRF after reading RDRF = 1.</li> <li>• When data is read from ICDRR.</li> </ul>  |

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 4   | NACKF    | 0             | R/W | <p>No Acknowledge Detection Flag</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> <li>When no acknowledge is detected from the receive device in transmission while the ACKE bit in ICIER is 1.</li> </ul> <p>[Clearing condition]</p> <ul style="list-style-type: none"> <li>When 0 is written in NACKF after reading NACKF = 1.</li> </ul>   |
| 3   | STOP     | 0             | R/W | <p>Stop Condition Detection Flag</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> <li>When a stop condition is detected after frame transfer.</li> </ul> <p>[Clearing condition]</p> <ul style="list-style-type: none"> <li>When 0 is written in STOP after reading STOP = 1.</li> </ul>   |
| 2   | AL       | 0             | R/W | <p>Arbitration Lost Flag</p> <p>This flag indicates that arbitration was lost in master mode.</p> <p>When two or more master devices attempt to seize the bus at nearly the same time, if the I<sup>2</sup>C bus interface detects data differing from the data it sent, it sets AL to 1 to indicate that the bus has been taken by another master.</p> <p>[Setting conditions]</p> <ul style="list-style-type: none"> <li>If the internal SDA and SDA pin disagree at the rise of SCL in master transmit mode.</li> <li>When the SDA pin outputs high in master mode while a start condition is detected.</li> </ul> <p>[Clearing condition]</p> <ul style="list-style-type: none"> <li>When 0 is written in AL after reading AL = 1.</li> </ul> |

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 1   | AAS      | 0             | R/W | <p>Slave Address Recognition Flag</p> <p>In slave receive mode, this flag is set to 1 if the first frame following a start condition matches bits SVA6 to SVA0 in SAR.</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> <li>When the slave address is detected in slave receive mode.</li> <li>When the general call address is detected in slave receive mode.</li> </ul> <p>[Clearing condition]</p> <ul style="list-style-type: none"> <li>When 0 is written in AAS after reading AAS = 1</li> </ul> |
| 0   | ADZ      | 0             | R/W | <p>General Call Address Recognition Flag</p> <p>This bit is valid in slave receive mode.</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> <li>When the general call address is detected in slave receive mode.</li> </ul> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> <li>When 0 is written in ADZ after reading ADZ = 1.</li> </ul>  |

### 16.3.6 Slave Address Register (SAR)

SAR is an 8-bit readable/writable register that sets slave address. When the chip is in slave mode, if the upper 7 bits of SAR match the upper 7 bits of the first frame received after a start condition, the chip operates as the slave device.

| Bit    | Bit Name     | Initial Value | R/W | Description   |
|--------|--------------|---------------|-----|---|
| 7 to 1 | SVA6 to SVA0 | All 0         | R/W | <p>Slave Address 6 to 0</p> <p>These bits set a unique address in bits SVA6 to SVA0, differing from the addresses of other slave devices connected to the I<sup>2</sup>C bus.</p> |
| 0      | —            | 0             | R/W | <p>Reserved</p> <p>This bit is readable/writable. The write value should always be 0.</p>   |

### 16.3.7 I<sup>2</sup>C Bus Transmit Data Register (ICDRT)

ICDRT is an 8-bit readable/writable register that stores the transmit data. When ICDRT detects the space in the I<sup>2</sup>C bus shift register (ICDRS), it transfers the transmit data which is written in ICDRT to ICDRS and starts transferring data. If the next transfer data is written to ICDRT during transferring data of ICDRS, continuous transfer is possible. The initial value of ICDRT is H'FF.

### 16.3.8 I<sup>2</sup>C Bus Receive Data Register (ICDRR)

ICDRR is an 8-bit register that stores the receive data. When data of one byte is received, ICDRR transfers the received data from ICDRS to ICDRR and the next data can be received. ICDRR is a receive-only register, therefore the CPU cannot be written to this register. The initial value of ICDRR is H'FF.

### 16.3.9 I<sup>2</sup>C Bus Shift Register (ICDRS)

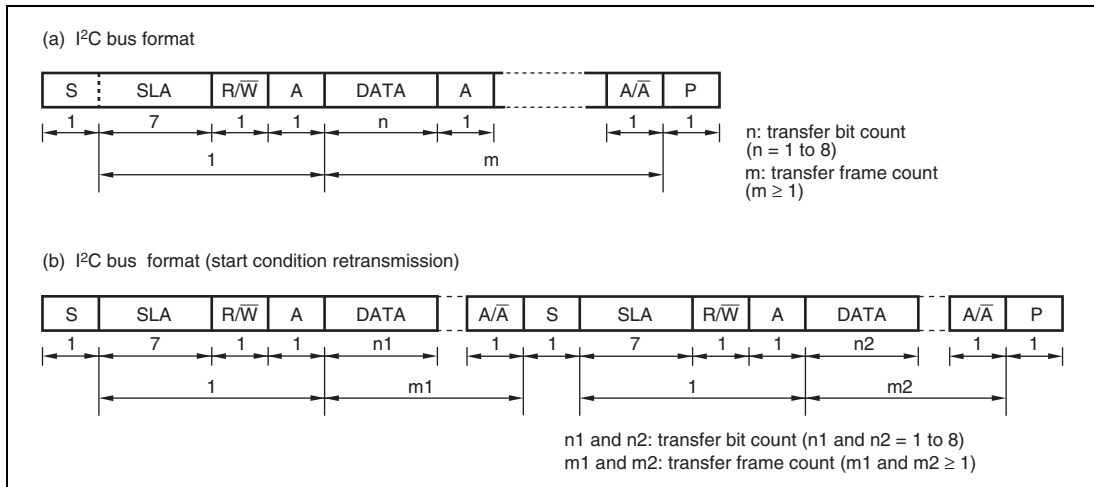

ICDRS is a register that is used to transfer/receive data. In transmission, data is transferred from ICDRT to ICDRS and the data is sent from the SDA pin. In reception, data is transferred from ICDRS to ICDRR after data of one byte is received. This register cannot be read from the CPU.

## 16.4 Operation

### 16.4.1 I<sup>2</sup>C Bus Format

Figure 16.3 shows the I<sup>2</sup>C bus formats. Figure 16.4 shows the I<sup>2</sup>C bus timing. The first frame following a start condition always consists of 8 bits.

**Figure 16.3 I<sup>2</sup>C Bus Formats**

**Figure 16.4 I<sup>2</sup>C Bus Timing**

**Legend:**

- S: Start condition. The master device drives SDA from high to low while SCL is high.
- SLA: Slave address
- R/ $\overline{W}$ : Indicates the direction of data transfer: from the slave device to the master device when R/ $\overline{W}$  is 1, or from the master device to the slave device when R/ $\overline{W}$  is 0.
- A: Acknowledge. The receiving device drives SDA to low.
- DATA: Transferred data
- P: Stop condition. The master device drives SDA from low to high while SCL is high.

**16.4.2 Master Transmit Operation**

In I<sup>2</sup>C bus format master transmit mode, the master device outputs the transmit clock and transmit data, and the slave device returns an acknowledge signal. The transmission procedure and operations in master transmit mode are described below.

1. Set the ICE bit in ICCRA to 1. Set the WAIT bit in ICMR and the CKS3 to CKS0 bits in ICCR1 to 1. (Initial setting)
2. Read the BBSY flag in ICCRB to confirm that the bus is free. Set the MST and TRS bits in ICCRA to select master transmit mode. Then, write 1 to BBSY and 0 to SCP using MOV instruction. (Start condition issued) This generates the start condition.
3. After confirming that TDRE in ICSR has been set, write the transmit data (the first byte data show the slave address and R/W) to ICDRT. After this, when TDRE is cleared to 0, data is transferred from ICDRT to ICDRS. TDRE is set again.
4. When transmission of one byte data is completed while TDRE is 1, TEND in ICSR is set to 1 at the rise of the 9th transmit clock pulse. Read the ACKBR bit in ICIER, and confirm that the slave device has been selected. Then, write second byte data to ICDRT, and clear TDRE and TEND. When ACKBR is 1, the slave device has not been acknowledged, so issue the stop condition. To issue the stop condition, write 0 to BBSY and SCP using MOV instruction. SCL is fixed low until the transmit data is prepared or the stop condition is issued.
5. The transmit data after the second byte is written to ICDRT every time TDRE is set, thus clearing TDRE.
6. Write the number of bytes to be transmitted to ICDRT. Wait until TEND is set (the end of last byte data transmission) while TDRE is 1, or wait for NACK (NACKF in ICSR = 1) from the receive device while ACKE in ICIER is 1. Then, issue the stop condition to clear TEND or NACKF.
7. When the STOP bit in ICSR is set to 1, the operation returns to the slave receive mode.

**Figure 16.5 Master Transmit Mode Operation Timing 1**

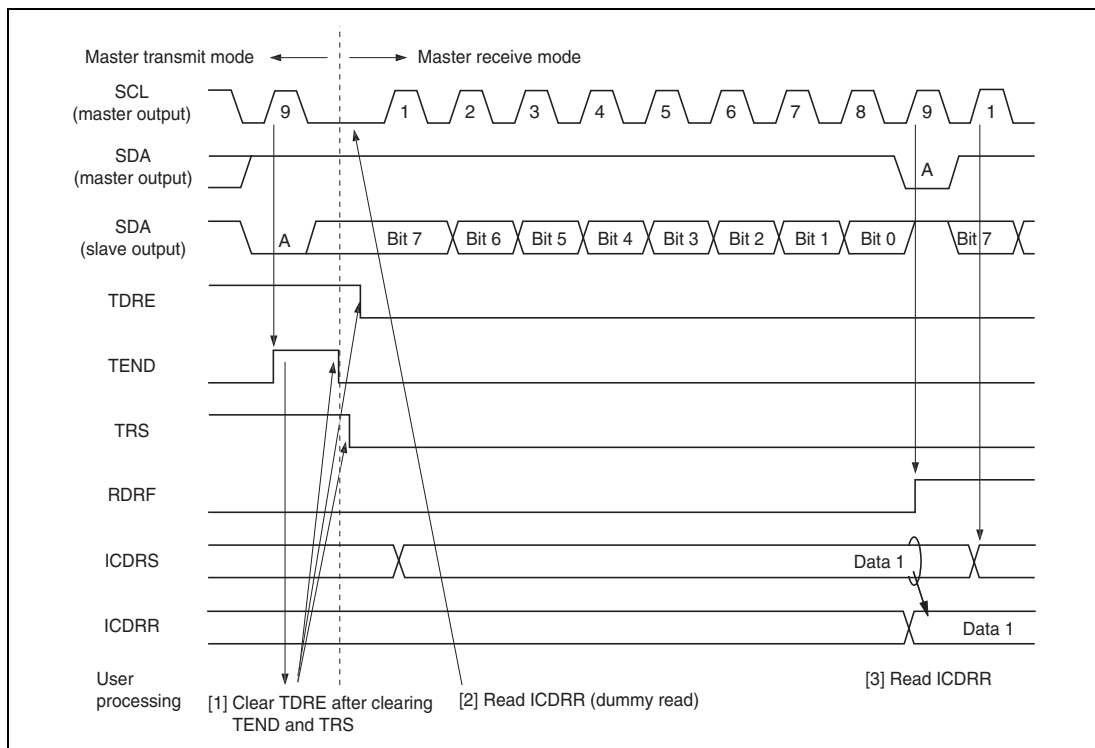

**Figure 16.6 Master Transmit Mode Operation Timing 2**

### 16.4.3 Master Receive Operation

In master receive mode, the master device outputs the receive clock, receives data from the slave device, and returns an acknowledge signal. The reception procedure and operations in master receive mode are shown below.

1. Clear the TEND bit in ICSR to 0, then clear the TRS bit in ICCRA to 0 to switch from master transmit mode to master receive mode. Then, clear the TDRE bit to 0.
2. When ICDRR is read (dummy data read), reception is started, and the receive clock is output, and data received, in synchronization with the internal clock. The master device outputs the level specified by ACKBT in ICIER to SDA, at the 9th receive clock pulse.
3. After the reception of first frame data is completed, the RDRF bit in ICST is set to 1 at the rise of 9th receive clock pulse. At this time, the received data is read by reading ICDRR.
4. The continuous reception is performed by reading ICDRR and clearing RDRF to 0 every time RDRF is set. If 8th receive clock pulse falls after reading ICDRR by the other processing while RDRF is 1, SCL is fixed low until ICDRR is read.
5. If next frame is the last receive data, set the RCVD bit in ICCR1 to 1 before reading ICDRR. This enables the issuance of the stop condition after the next reception.
6. When the RDRF bit is set to 1 at rise of the 9th receive clock pulse, read ICDRR. Then, clear RCVD.
7. When the STOP bit in ICSR is set to 1, read ICDRR and clear RDRF to 0. Then clear the RCVD bit to 0.
8. The operation returns to the slave receive mode.

**Figure 16.7 Master Receive Mode Operation Timing 1**

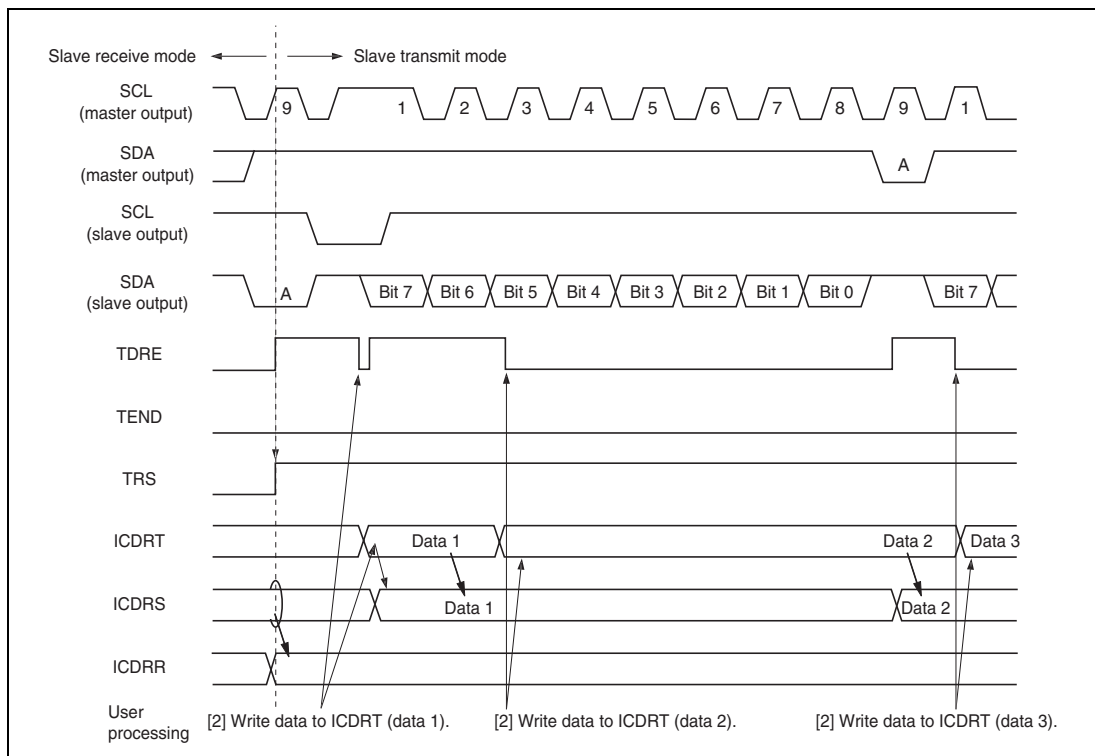

**Figure 16.8 Master Receive Mode Operation Timing 2**

#### 16.4.4 Slave Transmit Operation

In slave transmit mode, the slave device outputs the transmit data, while the master device outputs the receive clock and returns an acknowledge signal.

The transmission procedure and operations in slave transmit mode are described below.

1. Set the ICE bit in ICCRA to 1. Set the MLS and WAIT bits in ICMR and the CKS3 to CKS0 bits in ICCRA to 1. (Initial setting) Set the MST and TRS bits in ICCRA to select slave receive mode, and wait until the slave address matches.
2. When the slave address matches in the first frame following detection of the start condition, the slave device outputs the level specified by ACKBT in ICIER to SDA, at the rise of the 9th clock pulse. At this time, if the 8th bit data ( $R/\bar{W}$ ) is 1, the TRS in ICCRA and TDRE in ICSR are set to 1, and the mode changes to slave transmit mode automatically. The continuous transmission is performed by clearing TDRE after writing transmit data to ICDRT every time TDRE is set.
3. If TDRE is set after writing last transmit data to ICDRT, wait until TEND in ICSR is set to 1, with TDRE = 1. When TEND is set, clear TEND.
4. Clear TRS for the end processing, and read ICDRR (dummy read). SCL is free.
5. Clear TDRE.

**Figure 16.9 Slave Transmit Mode Operation Timing 1**

**Figure 16.10 Slave Transmit Mode Operation Timing 2**

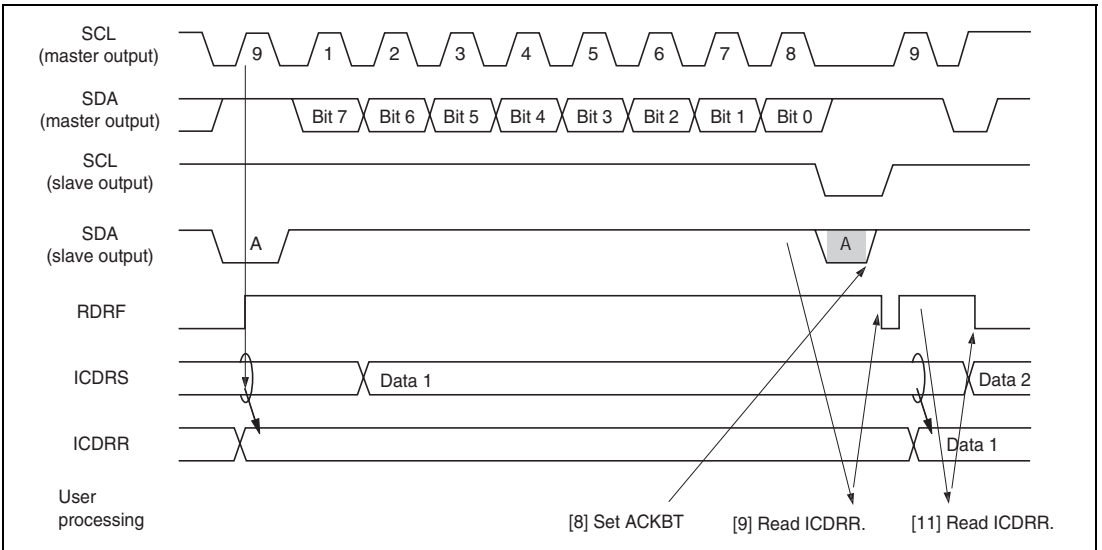

### 16.4.5 Slave Receive Operation

In slave receive mode, the master device outputs the transmit clock and transmit data, and the slave device returns an acknowledge signal. The reception procedure and operations in slave receive mode are described below.

1. Set the ICE bit in ICCRA to 1. Set the MLS and WAIT bits in ICMR and the CKS3 to CKS0 bits in ICCRA to 1. (Initial setting) Set the MST and TRS bits in ICCRA to select slave receive mode, and wait until the slave address matches.
2. When the slave address matches in the first frame following detection of the start condition, the slave device outputs the level specified by ACKBT in ICIER to SDA, at the rise of the 9th clock pulse. At the same time, RDRF in ICSR is set to read ICDRR (dummy read) and RDRF is cleared. (Since the read data show the slave address and  $R/\overline{W}$ , it is not used.)
3. Clear RDRF after reading ICDRR every time RDRF is set. If 8th receive clock pulse falls while RDRF is 1, SCL is fixed low until ICDRR is read. The change of the acknowledge before reading ICDRR, to be returned to the master device, is reflected to the next transmit frame.
4. The last byte data is read by reading ICDRR.

**Figure 16.11 Slave Receive Mode Operation Timing 1**

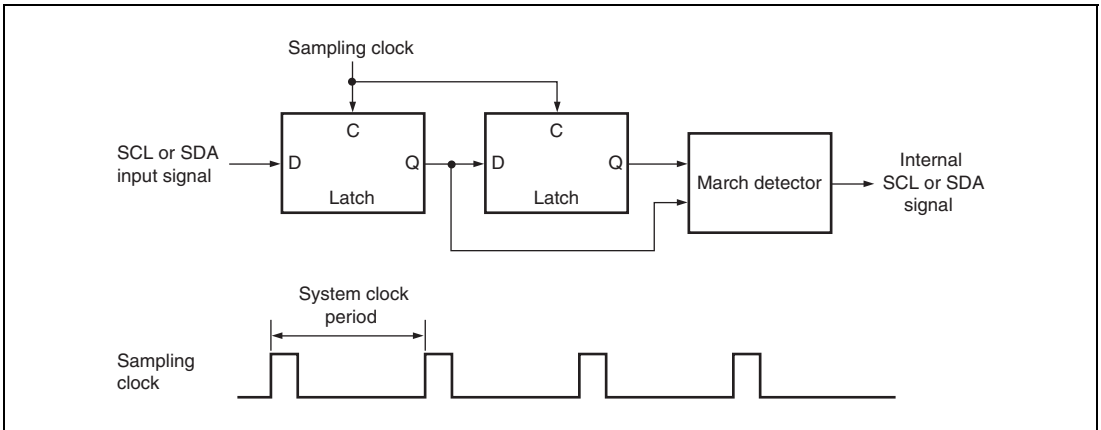

**Figure 16.12 Slave Receive Mode Operation Timing 2**

### 16.4.6 Noise Canceler

The logic levels at the SCL and SDA pins are routed through noise cancelers before being latched internally. Figure 16.13 shows a block diagram of the noise canceler circuit.

The noise canceler consists of two cascaded latches and a match detector. The SCL (or SDA) input signal is sampled on the system clock, but is not passed forward to the next circuit unless the outputs of both latches agree. If they do not agree, the previous value is held.

**Figure 16.13 Block Diagram of Noise Canceler**

### 16.4.7 Example of Use

Flowcharts in respective modes that use the I<sup>2</sup>C bus interface are shown in figures 16.14 to 16.17.

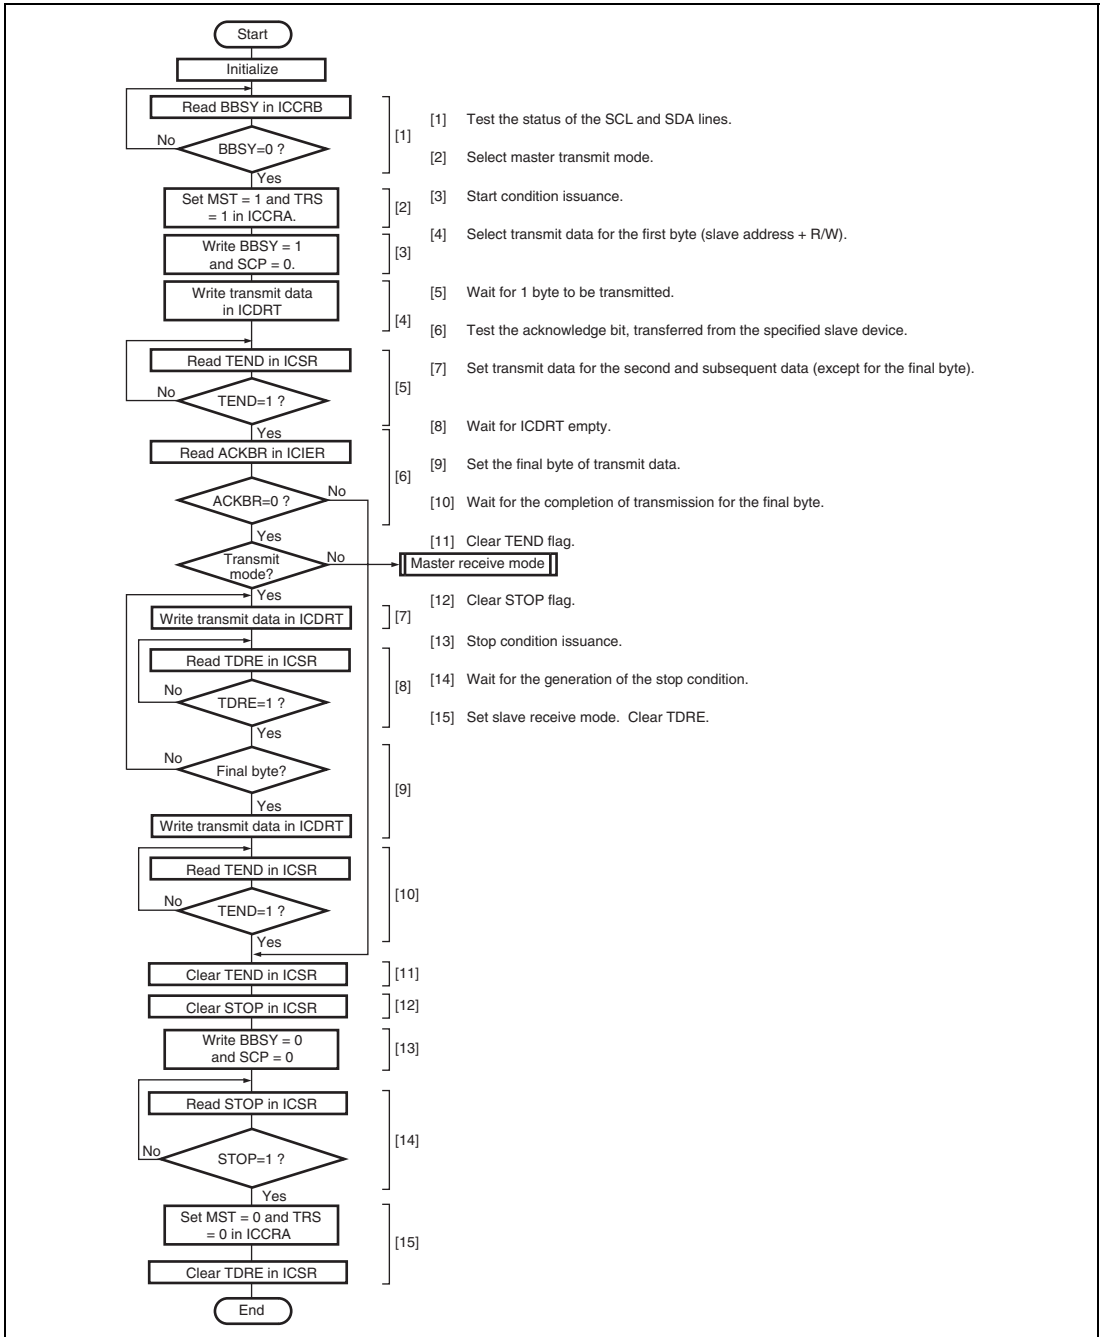

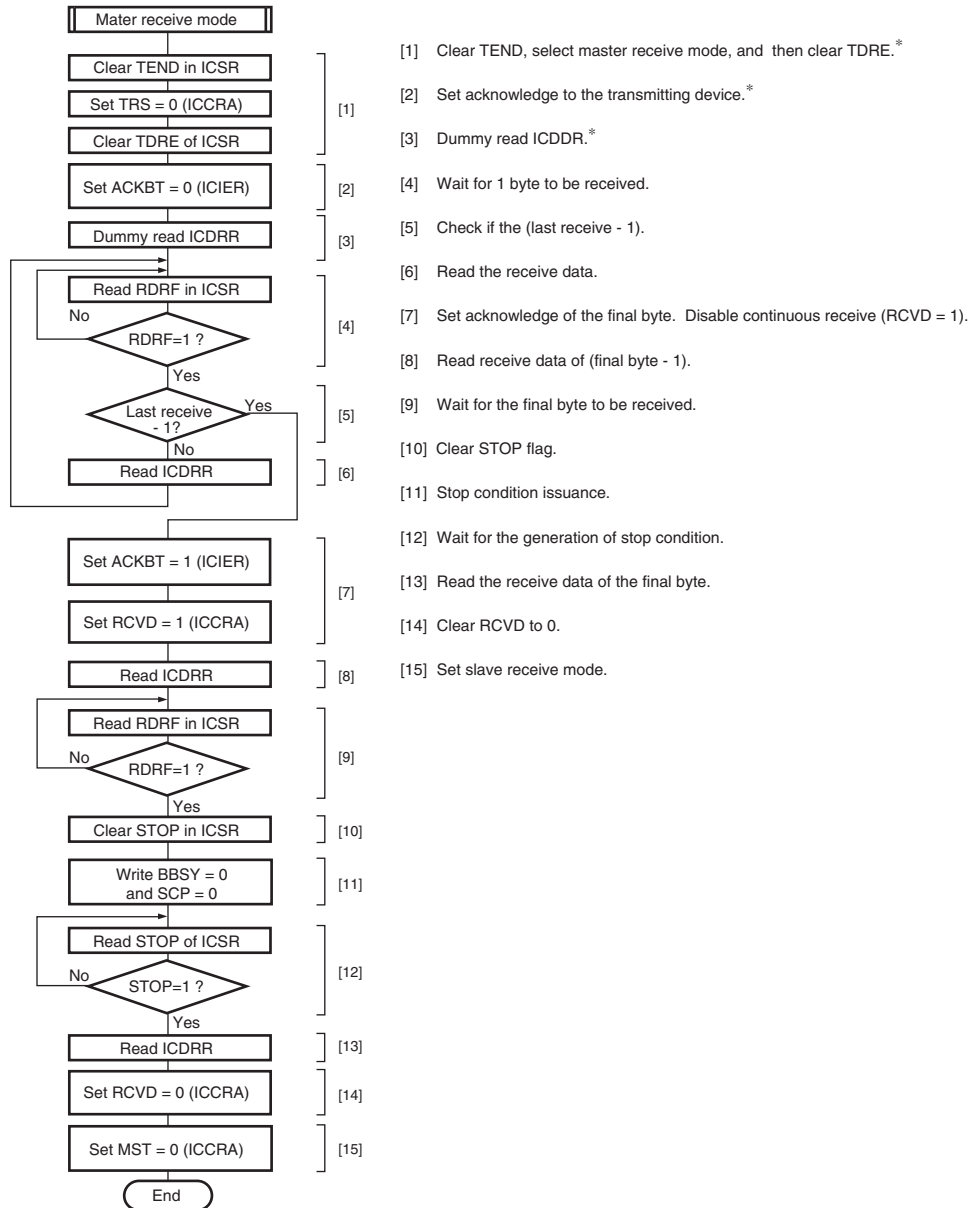

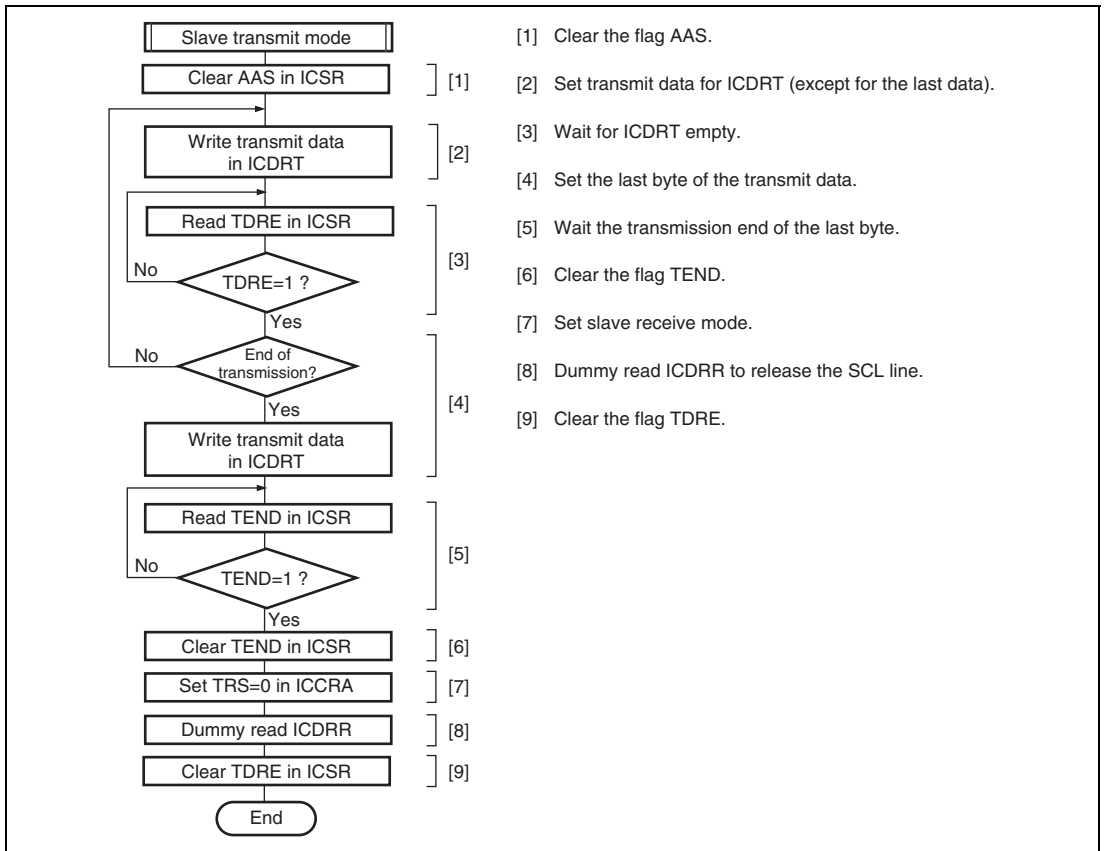

Figure 16.14 Sample Flowchart for Master Transmit Mode

Note: \* Ensure that no interrupts are received while steps [1] through [3] are being processed.

Additional information: If only one byte is received, steps [2] through [6] are omitted following step [1], and processing jumps to step [7]. Step [8] is ICDRR dummy read.

**Figure 16.15 Sample Flowchart for Master Receive Mode**

**Figure 16.16 Sample Flowchart for Slave Transmit Mode**

Figure 16.17 Sample Flowchart for Slave Receive Mode

## 16.5 Interrupt Request

There are six interrupt requests in this module; transmit data empty, transmit end, receive data full, NACK detection, STOP recognition, and arbitration lost. Table 16.3 shows the contents of each interrupt request.

**Table 16.3 Interrupt Requests**

| Interrupt Request   | Abbreviation | Interrupt Condition                    |
|---------------------|--------------|--|
| Transmit Data Empty | TXI          | $(TDRE=1) \cdot (TIE=1)$               |
| Transmit End        | TEI          | $(TEND=1) \cdot (TEIE=1)$              |
| Receive Data Full   | RXI          | $(RDRF=1) \cdot (RIE=1)$               |
| STOP Recognition    | STPI         | $(STOP=1) \cdot (STIE=1)$              |
| NACK Detection      | NAKI         | $\{(NACKF=1)+(AL=1)\} \cdot (NAKIE=1)$ |
| Arbitration Lost    |              |  |

Interrupt exception handling is performed when the interrupt conditions listed in table 16.3 are set to 1 and the CPU is ready to accept interrupts. During exception handling, the interrupt sources should be cleared. Note, however, that TDRE and TEND are automatically cleared by writing transmit data to ICDRT, and RDRF is automatically cleared by reading data from ICDRR. In particular, if TDRE is set at the same time transmit data is written to ICDRT, and then TDRE is cleared again, an extra byte of data may be transmitted.

## 16.6 Bit Synchronous Circuit

In master mode,

- When SCL is driven to low by the slave device
- When the rising speed of SCL is lower by the load of the SCL line (load capacitance or pull-up resistance)

This module has a possibility that high level period may be short in the two states described above. Therefore it monitors SCL and communicates by bit with synchronization. Figure 16.18 shows the timing of the bit synchronous circuit and table 16.4 shows the time when SCL output changes from low to Hi-Z then SCL is monitored.

**Figure 16.18 Timing of the Bit Synchronous Circuit**

**Table 16.4 Time for monitoring SCL**

| CKS3 | CKS2 | CSK1 | CSK0                  | Time for monitoring SCL |
|------|------|------|-----------------------|-------------------------|
| 0    | 0    | *    | *                     | 7.5 t <sub>cyc</sub>    |
|      |      |      | 0                     | 41.5 t <sub>cyc</sub>   |
|      | 1    | *    | 19.5 t <sub>cyc</sub> |                         |
| 1    | 0    | *    | *                     | 17.5 t <sub>cyc</sub>   |
|      |      |      | 0                     | 85.5 t <sub>cyc</sub>   |
|      | 1    | *    | 41.5 t <sub>cyc</sub> |                         |

## 16.7 Usage Notes

1. Issue (retransmit) the start/stop conditions after the fall of the ninth clock is confirmed. Check SCLO in the I<sup>2</sup>C control register B (IICRB) to confirm the fall of the ninth clock. When the start/stop conditions are issued (retransmitted) at the specific timing under the following condition (i) or (ii), such conditions may not be output successfully. This does not occur in other cases.
  - (i) When the rising of SCL falls behind the time specified in section 16.6, Bit Synchronous Circuit, by the load of the SCL bus (load capacitance or pull-up resistance)
  - (ii) When the bit synchronous circuit is activated by extending the low period of eighth and ninth clocks, that is driven by the slave device
2. Control WAIT in the I<sup>2</sup>C bus mode register (ICMR) to be set to 0. When WAIT is set to 1, and SCL is driven low for two or more transfer clocks by the slave device at the eighth and ninth clocks, the high period of ninth clock may be shortened. This does not occur in other cases.
3. In slave receive mode, even if a slave address does not match, received data is stored in ICDRR, and then the RDRF bit in ICSR is set. To confirm whether or not the addresses matched, see the AAS bit in the I2C bus status register (ICSR). (See figure 16.17, Sample Flowchart for Slave Receive Mode.)
4. If 0 is written to the ICE bit in ICCRA or 1 is written to the IICRST bit in ICCRB in one of the following four states, the BBSY bit in ICCRB and STOP bit in ICSR are undefined.
  - (1) This module is the bus master of the I2C in master transmission mode (MST = 1 and TRS = 1 in ICCRA).
  - (2) This module is the bus master of the I2C in master reception mode (MST = 1 and TRS = 0 in ICCRA).
  - (3) This module is transmitting data in slave transmission mode (MST = 0 and TRS = 1 in ICCRA).
  - (4) This module is transmitting an acknowledgment in slave reception mode (MST = 0 and TRS = 0 in ICCRA).

The undefined state of BBSY in ICCRB can be exited in one of the following ways:

- Input the start condition (SCL = high and SDA falling) to set BBSY to 1.
- Input the stop condition (SCL = high and SDA rising) to clear BBSY to 0.
- Write 1 to BBSY and 0 to SCP in ICCRB to issue the start condition with SCL = high and SDA = high in master transmission mode. BBSY is set to 1 when the start condition (SCL = high and SDA falling) is output.

- Write 0 to BBSY and SCP in ICCRB to issue the stop condition when SDA = low in master transmission or master reception mode and this module is the only module which pulls SCL low. BBSY is cleared to 0 when the stop condition (SCL = high and SDA rising) is output.

## Section 17 A/D Converter

This LSI includes two units (units 0 and 1) of successive approximation type 10-bit A/D converter. In the H8S/2426 group and H8S/2426R group, the A/D converter units 0 and 1 allow up to eight analog input channels to be selected. In the H8S/2424 group, unit 0 allows up to eight analog input channels to be selected while unit 1 allows up to two channels.

Figures 17.1 and 17.2 show block diagrams of the A/D converter units 0 and 1, respectively.

### 17.1 Features

- 10-bit resolution
- Input channels:
  - H8S/2426 group and H8S/2426R group: Eight channels (total of 16 channels for the two units)
  - H8S/2424 group: Eight channels for unit 0 and two channels for unit 1 (total of 10 channels for the two units)
- Conversion cycle: 64 cycles or 40 cycles (A/D conversion clock)
- Two kinds of operating modes
  - Single mode: Single-channel A/D conversion
  - Scan mode: Continuous A/D conversion on 1 to 4 channels, or 1 to 8 channels\*<sup>1</sup>
- Separate A/D conversion clock specifiable for each unit ( $\phi$ ,  $\phi/2$ , or  $\phi/4$ )
- Eight data registers for A/D converter unit 0 and eight data registers for unit 1\*<sup>2</sup> (total of 16 data registers for the two units)
 

Results of A/D conversion are held in a 16-bit data register for each channel.
- Sample and hold functionality
- Three types of conversion start
 

Conversion can be started by software, a conversion start trigger by the 16-bit timer pulse unit (TPU) or 8-bit timer (TMR), or an external trigger signal.
- Interrupt source
 

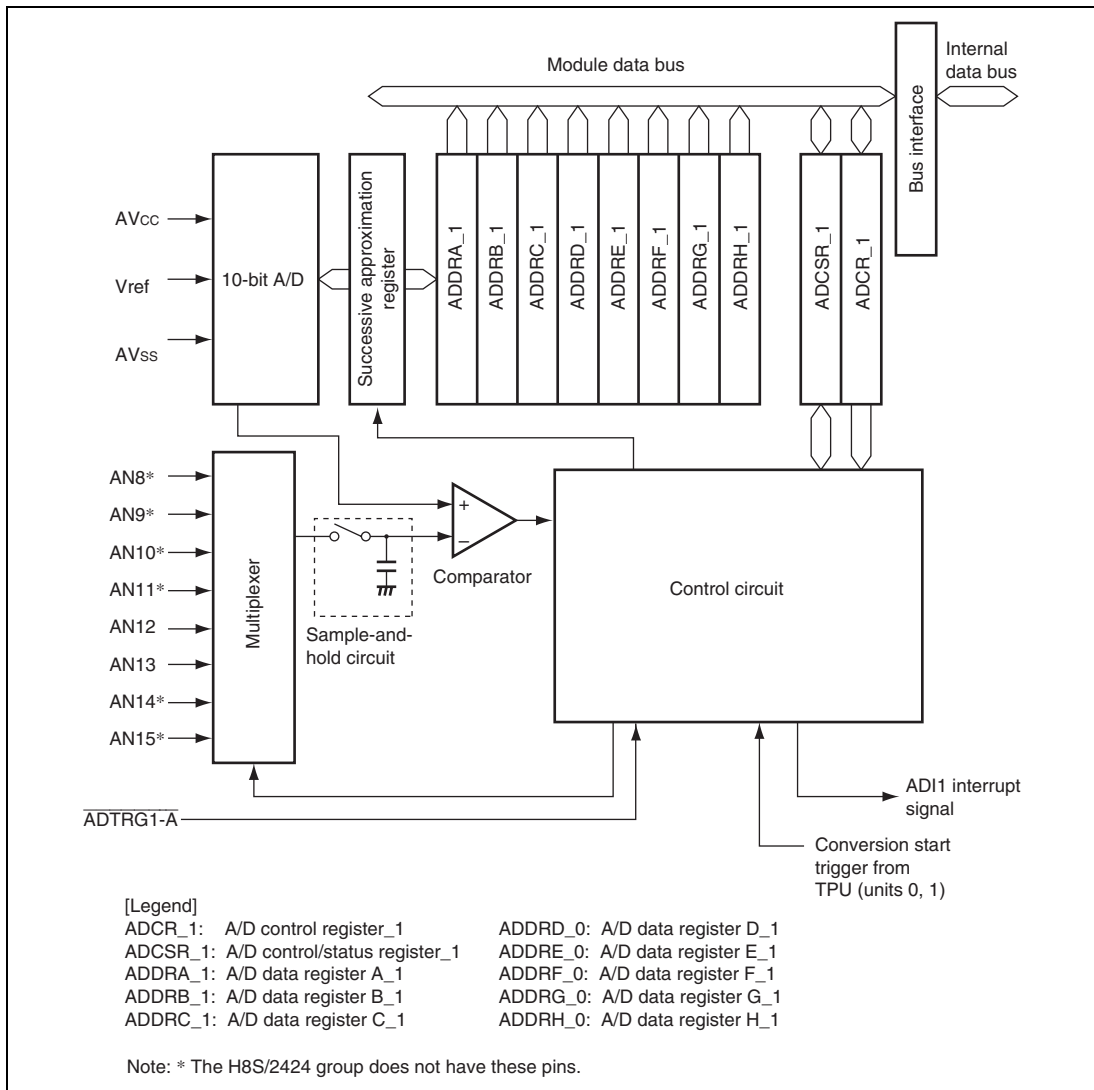

A/D conversion end interrupt (ADI) request can be generated.
- Module stop state specifiable

Notes: 1. Continuous A/D conversion on 1 to 2 channels in the H8S/2424 group.

2. Two data registers for unit 1 (total of ten data registers for the two units) in the H8S/2424 group.

**Figure 17.1 Block Diagram of A/D Converter Unit 0 (AD\_0)**

**Figure 17.2 Block Diagram of A/D Converter Unit 1 (AD\_1)**

## 17.2 Input/Output Pins

Tables 17.1 and 17.2 show the pin configuration of the A/D converter.

**Table 17.1 Pin Configuration (H8S/2426 Group and H8S/2426R Group)**

| Unit   | Symbol | Pin Name                           | Symbol           | I/O   | Function                         |   |
|--------|--------|------------------------------------|------------------|-------|----------------------------------|---|
| 0      | AD_0   | Analog input pin 0                 | AN0              | Input | Analog inputs                    |   |
|        |        | Analog input pin 1                 | AN1              | Input |                                  |   |
|        |        | Analog input pin 2                 | AN2              | Input |                                  |   |
|        |        | Analog input pin 3                 | AN3              | Input |                                  |   |
|        |        | Analog input pin 4                 | AN4              | Input |                                  |   |
|        |        | Analog input pin 5                 | AN5              | Input |                                  |   |
|        |        | Analog input pin 6                 | AN6              | Input |                                  |   |
|        |        | Analog input pin 7                 | AN7              | Input |                                  |   |
|        |        | A/D external trigger input pin 0_A | ADTRG0-A         | Input |                                  | External trigger input pin 0_A for starting A/D conversion* |
|        |        | A/D external trigger input pin 0_B | ADTRG0-B         | Input |                                  | External trigger input pin 0_B for starting A/D conversion* |
| 1      | AD_1   | Analog input pin 8                 | AN8              | Input | Analog inputs                    |   |
|        |        | Analog input pin 9                 | AN9              | Input |                                  |   |
|        |        | Analog input pin 10                | AN10             | Input |                                  |   |
|        |        | Analog input pin 11                | AN11             | Input |                                  |   |
|        |        | Analog input pin 12                | AN12             | Input |                                  |   |
|        |        | Analog input pin 13                | AN13             | Input |                                  |   |
|        |        | Analog input pin 14                | AN14             | Input |                                  |   |
|        |        | Analog input pin 15                | AN15             | Input |                                  |   |
|        |        | A/D external trigger input pin 1   | ADTRG1           | Input |                                  | External trigger input pin A for starting A/D conversion    |
| Common |        | Analog power supply pin            | AV <sub>cc</sub> | Input | Analog block power supply        |   |
|        |        | Analog ground pin                  | AV <sub>ss</sub> | Input | Analog block ground              |   |
|        |        | Reference voltage pin              | Vref             | Input | A/D conversion reference voltage |   |

Note: \* Selectable by setting of the TRGS1, TRGS0, and EXTRGS bits in ADCR.

| Common |       | Analog power supply pin            | AV <sub>CC</sub> | Input | Analog block power supply        |   |
|        |       | Analog ground pin                  | AV <sub>SS</sub> | Input | Analog block ground              |   |
|        |       | Reference voltage pin              | Vref             | Input | A/D conversion reference voltage |   |

Note: \* Selectable by setting of the TRGS1, TRGS0, and EXTRGS bits in ADCR.

## 17.3 Register Descriptions

The A/D converter has the following registers.

Unit 0 (A/D\_0) registers:

- A/D data register A\_0 (ADDRA\_0)
- A/D data register B\_0 (ADDRB\_0)
- A/D data register C\_0 (ADDRC\_0)
- A/D data register D\_0 (ADDRD\_0)
- A/D data register E\_0 (ADDRE\_0)
- A/D data register F\_0 (ADDRF\_0)
- A/D data register G\_0 (ADDRG\_0)
- A/D data register H\_0 (ADDRH\_0)
- A/D control/status register\_0 (ADCSR\_0)
- A/D control register\_0 (ADCR\_0)

Unit 1 (A/D\_1) registers:

- A/D data register A\_1 (ADDRA\_1)
- A/D data register B\_1 (ADDRB\_1)
- A/D data register C\_1 (ADDRC\_1)
- A/D data register D\_1 (ADDRD\_1)
- A/D data register E\_1 (ADDRE\_1)
- A/D data register F\_1 (ADDRF\_1)
- A/D data register G\_1 (ADDRG\_1)
- A/D data register H\_1 (ADDRH\_1)
- A/D control/status register\_1 (ADCSR\_1)
- A/D control register\_1 (ADCR\_1)

### 17.3.1 A/D Data Registers A to H (ADDRA to ADDRH)

There are eight 16-bit read-only ADDR registers, ADDRA to ADDRH, used to store the results of A/D conversion. The ADDR registers, which store a conversion result for each channel, are shown in tables 17.3 and 17.4.

The converted 10-bit data is stored in bits 15 to 6. The lower 6-bit data is always read as 0.

The data bus between the CPU and the A/D converter has a 16-bit width. The data can be read directly from the CPU. ADDR must not be accessed in 8-bit units and must be accessed in 16-bit units.

**Table 17.3 Analog Input Channels and Corresponding ADDR Registers  
(H8S/2426 Group and H8S/2426R Group)**

| Analog Input Channel       |  | Analog Input Channel       |  |
|----------------------------|--|----------------------------|--|
| Channel Set 0<br>(CH3 = 0) | Data Register Storing<br>Conversion Result | Channel Set 0<br>(CH3 = 0) | Data Register Storing<br>Conversion Result |
| AN0                        | ADDRA_0                                    | AN8                        | ADDRA_1                                    |
| AN1                        | ADDRB_0                                    | AN9                        | ADDRB_1                                    |
| AN2                        | ADDRC_0                                    | AN10                       | ADDRC_1                                    |
| AN3                        | ADDRD_0                                    | AN11                       | ADDRD_1                                    |
| AN4                        | ADDRE_0                                    | AN12                       | ADDRE_1                                    |
| AN5                        | ADDRF_0                                    | AN13                       | ADDRF_1                                    |
| AN6                        | ADDRG_0                                    | AN14                       | ADDRG_1                                    |
| AN7                        | ADDRH_0                                    | AN15                       | ADDRH_1                                    |

**Table 17.4 Analog Input Channels and Corresponding ADDR Registers (H8S/2424 Group)**

| <b>Analog Input Channel</b>        |  | <b>Analog Input Channel</b>        |  |
|------------------------------------|--|------------------------------------|--|
| <b>Channel Set 0<br/>(CH3 = 0)</b> | <b>Data Register Storing<br/>Conversion Result</b> | <b>Channel Set 0<br/>(CH3 = 0)</b> | <b>Data Register Storing<br/>Conversion Result</b> |
| AN0                                | ADDRA_0  | —                                  | —  |
| AN1                                | ADDRB_0  | —                                  | —  |
| AN2                                | ADDRC_0  | —                                  | —  |

| AN4                                | ADDRE_0  | AN12                               | ADDRE_1  |
| AN5                                | ADDRF_0  | AN13                               | ADDRF_1  |
| AN6                                | ADDRG_0  | —                                  | —  |

### 17.3.2 A/D Control/Status Register for Unit 0 (ADCSR\_0)

ADCSR\_0 controls A/D conversion operations.

| Bit | Bit Name | Initial Value | R/W    | Description   |
|-----|----------|---------------|--------|---|
| 7   | ADF      | 0             | R/(W)* | <p>A/D End Flag</p> <p>A status flag that indicates the end of A/D conversion.</p> <p>[Setting conditions]</p> <ul style="list-style-type: none"> <li>• Completion of A/D conversion in single mode</li> <li>• Completion of A/D conversion on all specified channels in scan mode</li> </ul> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> <li>• Writing of 0 after reading ADF = 1</li> <li>• Reading from ADDR after activation of the DMAC or DTC by an ADI interrupt</li> </ul>  |
| 6   | ADIE     | 0             | R/W    | <p>A/D Interrupt Enable</p> <p>Setting this bit to 1 enables ADI interrupts by ADF.</p>   |
| 5   | ADST     | 0             | R/W    | <p>A/D Start</p> <p>Clearing this bit to 0 stops A/D conversion, and the A/D converter enters wait state.</p> <p>Setting this bit to 1 starts A/D conversion. In single mode, this bit is cleared to 0 automatically when A/D conversion on the specified channel ends. In scan mode, A/D conversion continues sequentially on the specified channels until this bit is cleared to 0 by software, a reset, or hardware standby mode. While the ADSTCLR bit in ADCR is set to 1, the ADST bit is cleared to 0 automatically when A/D conversion on all selected channels ends, and then A/D conversion stops.</p> <p>The timing to clear the ADST bit automatically differs from that of ADF setting; the ADST bit is cleared before the ADF bit is set.</p> |
| 4   | EXCKS    | 0             | R/W    | <p>Clock Extension Select</p> <p>Specifies the A/D conversion time in combination with the CKS1 and CKS0 bits in ADCR. Be sure to set these three bits at one time. For details, see the description of the ADCR registers.</p>   |

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 3   | CH3      | 0             | R/W | Channel Select 3 to 0  |
| 2   | CH2      | 0             | R/W | Selects analog input together with bits SCANE and SCANS in ADCR.   |
| 1   | CH1      | 0             | R/W |  |
| 0   | CH0      | 0             | R/W | <ul style="list-style-type: none"> <li>• When SCANE = 0 and SCANS = x               <ul style="list-style-type: none"> <li>0000: AN0</li> <li>0001: AN1</li> <li>0010: AN2</li> <li>0011: AN3</li> <li>0100: AN4</li> <li>0101: AN5</li> <li>0110: AN6</li> <li>0111: AN7</li> <li>1xxx: Setting prohibited</li> </ul> </li> <li>• When SCANE = 1 and SCANS = 0               <ul style="list-style-type: none"> <li>0000: AN0</li> <li>0001: AN0 and AN1</li> <li>0010: AN0 to AN2</li> <li>0011: AN0 to AN3</li> <li>0100: AN4</li> <li>0101: AN4 and AN5</li> <li>0110: AN4 to AN6</li> <li>0111: AN4 to AN7</li> <li>1xxx: Setting prohibited</li> </ul> </li> <li>• When SCANE = 1 and SCANS = 1               <ul style="list-style-type: none"> <li>0000: AN0</li> <li>0001: AN0 and AN1</li> <li>0010: AN0 to AN2</li> <li>0011: AN0 to AN3</li> <li>0100: AN0 to AN4</li> <li>0101: AN0 to AN5</li> <li>0110: AN0 to AN6</li> <li>0111: AN0 to AN7</li> <li>1xxx: Setting prohibited</li> </ul> </li> </ul> |

---

[Legend]

x: Don't care

Note: \* Only 0 can be written to this bit, to clear the flag.

### 17.3.3 A/D Control/Status Register for Unit 1 (ADCSR\_1)

ADCSR\_1 controls A/D conversion operations.

| Bit | Bit Name | Initial Value | R/W    | Description   |
|-----|----------|---------------|--------|---|
| 7   | ADF      | 0             | R/(W)* | <p>A/D End Flag</p> <p>A status flag that indicates the end of A/D conversion.</p> <p>[Setting conditions]</p> <ul style="list-style-type: none"> <li>• Completion of A/D conversion in single mode</li> <li>• Completion of A/D conversion on all specified channels in scan mode</li> </ul> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> <li>• Writing of 0 after reading ADF = 1</li> <li>• Reading from ADDR after activation of the DTC by an ADI interrupt</li> </ul>  |
| 6   | ADIE     | 0             | R/W    | <p>A/D Interrupt Enable</p> <p>Setting this bit to 1 enables ADI interrupts by ADF.</p>   |
| 5   | ADST     | 0             | R/W    | <p>A/D Start</p> <p>Clearing this bit to 0 stops A/D conversion, and the A/D converter enters wait state.</p> <p>Setting this bit to 1 starts A/D conversion. In single mode, this bit is cleared to 0 automatically when A/D conversion on the specified channel ends. In scan mode, A/D conversion continues sequentially on the specified channels until this bit is cleared to 0 by software, a reset, or hardware standby mode. While the ADSTCLR bit in ADCR is set to 1, the ADST bit is cleared to 0 automatically when A/D conversion on all selected channels ends, and then A/D conversion stops.</p> <p>The timing to clear the ADST bit automatically differs from that of ADF setting; the ADST bit is cleared before the ADF bit is set.</p> |
| 4   | EXCKS    | 0             | R/W    | <p>Clock Extension Select</p> <p>Specifies the A/D conversion time in combination with the CKS1 and CKS0 bits in ADCR. Be sure to set these three bits at one time. For details, see the description of the ADCR registers.</p>   |

Note: \* Setting prohibited in the H8S/2424 group.

## 17.4 Operation

The A/D converter has two operating modes: single mode and scan mode. First select the clock for A/D conversion (ADCLK). When changing the operating mode or analog input channel, to prevent incorrect operation, first clear the ADST bit in ADCSR to 0. The ADST bit can be set to 1 at the same time as the operating mode or analog input channel is changed.

### 17.4.1 Single Mode

In single mode, A/D conversion is to be performed only once on the analog input of the specified single channel.

1. A/D conversion for the selected channel is started when the ADST bit in ADCSR is set to 1 by software, TPU, TMR, or an external trigger input.
2. When A/D conversion is completed, the A/D conversion result is transferred to the corresponding A/D data register of the channel.
3. When A/D conversion is completed, the ADF bit in ADCSR is set to 1. If the ADIE bit is set to 1 at this time, an ADI interrupt request is generated.
4. The ADST bit remains at 1 during A/D conversion, and is automatically cleared to 0 when A/D conversion ends. The A/D converter enters wait state. If the ADST bit is cleared to 0 during A/D conversion, A/D conversion stops and the A/D converter enters a wait state.

**Figure 17.3 Example of A/D Converter Operation (Single Mode, Channel 1 Selected)**

## 17.4.2 Scan Mode

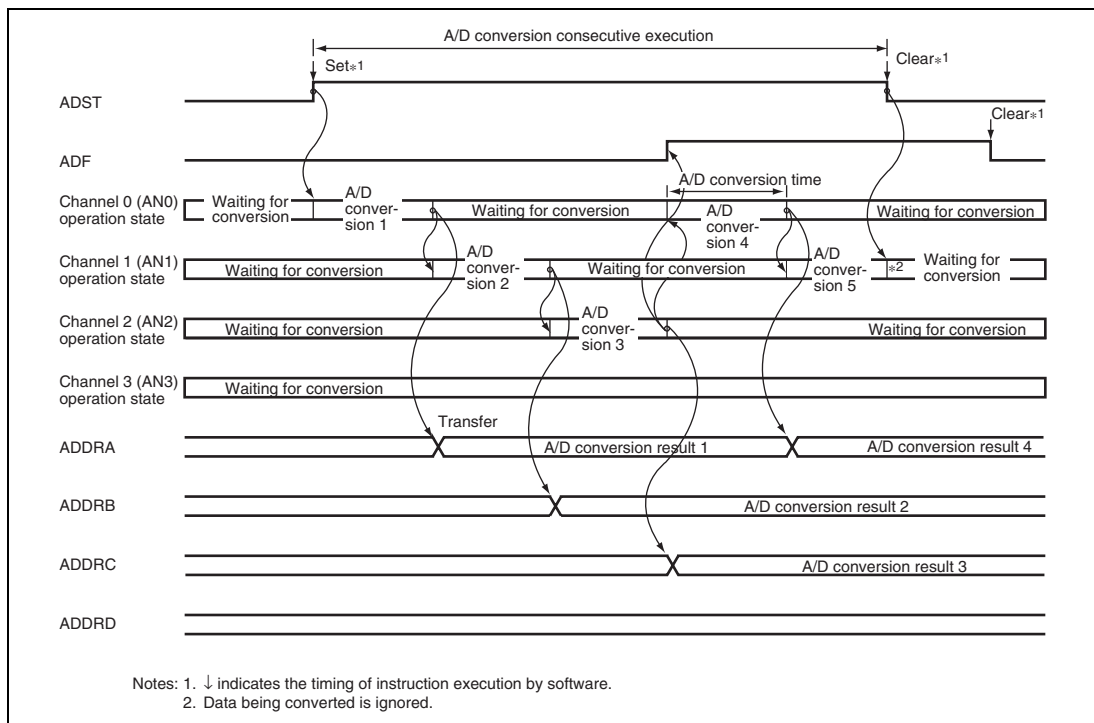

In scan mode, A/D conversion is to be performed sequentially on the analog inputs of the specified channels up to four or eight\* channels. Two types of scan mode are provided, that is, continuous scan mode where A/D conversion is repeatedly performed and one-cycle scan mode where A/D conversion is performed for the specified channels for one cycle.

### (1) Continuous Scan Mode

1. When the ADST bit in ADCSR is set to 1 by software, TPU, TMR, or an external trigger input, A/D conversion starts on the first channel in the specified channel group. Consecutive A/D conversion on a maximum of four channels (SCANE and SCANS = B'10) or on a maximum of eight channels (SCANE and SCANS = B'11) can be selected. When consecutive A/D conversion is performed on four channels, A/D conversion starts on AN0 when CH3 and CH2 of unit 0 = B'00, on AN4 when CH3 and CH2 of unit 1 = B'01, on AN8\* when CH3 and CH2 of unit 1 = B'10, or on AN12 when CH3 and CH2 of unit 1 = B'11. When consecutive A/D conversion is performed on eight channels, A/D conversion starts on AN0 when CH3 = B'0 or on AN8\* when CH3 = B'1.
2. When A/D conversion for each channel is completed, the A/D conversion result is sequentially transferred to the corresponding ADDR of each channel.
3. When A/D conversion of all selected channels is completed, the ADF bit in ADCSR is set to 1. If the ADIE bit is set to 1 at this time, an ADI interrupt request is generated. A/D conversion of the first channel in the group starts again.
4. The ADST bit is not cleared automatically, and steps 2 to 3 are repeated as long as the ADST bit remains set to 1. When the ADST bit is cleared to 0, A/D conversion stops and the A/D converter enters wait state. If the ADST bit is later set to 1, A/D conversion starts again from the first channel in the group.

Note: \* Only possible in the H8S/2426 group and H8S/2426R group.

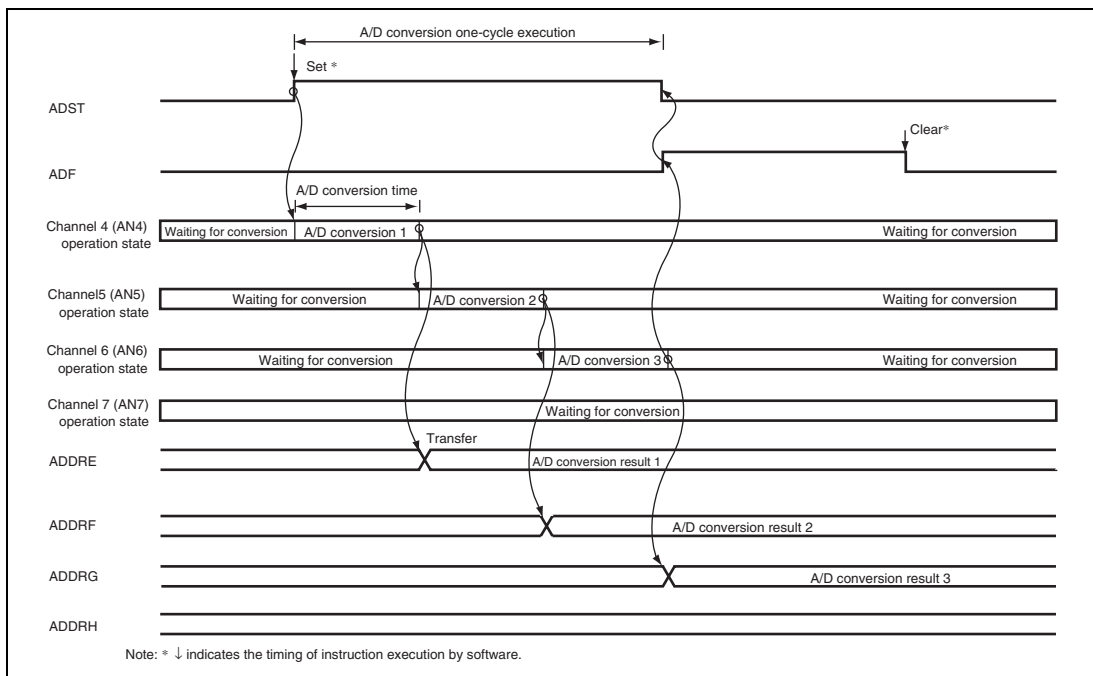

**Figure 17.4 Example of A/D Conversion  
(Continuous Scan Mode, Three Channels (AN0 to AN2) Selected)**

## (2) One-Cycle Scan Mode

1. Set the ADSTCLR bit in ADCR to 1.
2. When the ADST bit in ADCSR is set to 1 by software, TPU, TMR, or an external trigger input, A/D conversion starts on the first channel in the specified channel group. Consecutive A/D conversion on a maximum of four channels (SCANE and SCANS = B'10) or on a maximum of eight channels (SCANE and SCANS = B'11) can be selected. When consecutive A/D conversion is performed on four channels, A/D conversion starts on AN0 when CH3 and CH2 of unit 0 = B'00, on AN4 when CH3 and CH2 of unit 1 = B'01, on AN8\* when CH3 and CH2 of unit 1 = B'10, or on AN12 when CH3 and CH2 of unit 1 = B'11. When consecutive A/D conversion is performed on eight channels, A/D conversion starts on AN0 when CH3 = B'0 or on AN8\* when CH3 = B'1.
3. When A/D conversion for each channel is completed, the A/D conversion result is sequentially transferred to the corresponding ADDR of each channel.
4. When A/D conversion of all selected channels is completed, the ADF bit in ADCSR is set to 1. If the ADIE bit is set to 1 at this time, an ADI interrupt request is generated.
5. The ADST bit is automatically cleared when A/D conversion is completed for all of the channels that have been selected. A/D conversion stops and the A/D converter enters a wait state.

Note: \* Only possible in the H8S/2426 group and H8S/2426R group.

**Figure 17.5 Example of A/D Conversion  
(One-Cycle Scan Mode, Three Channels (AN4 to AN6) Selected)**

### 17.4.3 Input Sampling and A/D Conversion Time

The A/D converter has a built-in sample-and-hold circuit. The A/D converter samples the analog input when the A/D conversion start delay time ( $t_D$ ) passes after the ADST bit in ADCSR is set to 1, then starts A/D conversion. Figure 17.6 shows the A/D conversion timing. Tables 17.5 and 17.6 show the A/D conversion time.

As shown in figure 17.6, the A/D conversion time ( $t_{CONV}$ ) includes the A/D conversion start delay time ( $t_D$ ) and the input sampling time ( $t_{SPL}$ ). The length of  $t_D$  varies depending on the timing of the write access to ADCSR. The total conversion time therefore varies within the ranges indicated in tables 17.5 and 17.6.

In scan mode, the values given in tables 17.5 and 17.6 apply to the first conversion time. The values given in table 17.7 apply to the second and subsequent conversions. In either case, bit EKCKS in ADCSR, and bits CKS1 and CKS0 in ADCR should be set so that the conversion time is within the ranges indicated by the A/D conversion characteristics.

**Figure 17.6 A/D Conversion Timing**

**Table 17.5 A/D Conversion Characteristics (EXCKS = 0)**

| Item                            | Symbol     | CKS1 = 0 |      |      | CKS1 = 1 |      |         |      |         |      |

|       |      | 1    | 160 (fixed)                        |
|       | 1    | 0    | 80 (fixed)                         |
|       |      | 1    | 40 (fixed)                         |

### 17.4.4 External Trigger Input Timing

A/D conversion can be externally triggered. For unit 0, an external trigger is input from the  $\overline{\text{ADTRG0}}$  pin when the TRGS1, TRGS0, and EXTRGS bits are set to B'110 or B'001 in ADCR\_0. For unit 1, an external trigger is input from the  $\overline{\text{ADTRG1}}$  pin when the TRGS1, TRGS0, and EXTRGS bits are set to B'110 in ADCR\_1. For multiple-unit simultaneous start, an external trigger is input from the  $\overline{\text{ADTRG0}}$  pin when the TRGS1, TRGS0, and EXTRGS bits are set to B'111 in ADCR. A/D conversion starts when the ADST bit in ADCSR is set to 1 on the falling edge of the  $\overline{\text{ADTRG0}}$  pin. Other operations, in both single and scan modes, are the same as when the ADST bit has been set to 1 by software. Figure 17.7 shows the timing. Figure 17.8 shows the timing of multiple-unit simultaneous start.

**Figure 17.7 External Trigger Input Timing (TRGS1, TRGS0, and EXTRGS  $\neq$  B'111)**

**Figure 17.8 External Trigger Input Timing when Multiple Units Start Simultaneously (TRSG1, TRGS0, and EXTRGS = B'111)**

## 17.5 Interrupt Source

The A/D converter generates an A/D conversion end interrupt (ADI) at the end of A/D conversion. Setting the ADIE bit to 1 when the ADF bit in ADCSR is set to 1 after A/D conversion is completed enables ADI interrupt requests. The data transfer controller (DTC)\* and DMA controller (DMAC) can be activated by an ADI interrupt. Having the converted data read by the DTC\* or DMAC in response to an ADI interrupt enables continuous conversion to be achieved without imposing a load on software.

Note: \* Only possible in unit 0.

**Table 17.8 A/D Converter Interrupt Source**

| Name | Interrupt Source   | Interrupt Flag | DTC Activation | DMAC Activation |
|------|--------------------|----------------|----------------|-----------------|
| ADI0 | A/D conversion end | ADF            | Possible*      | Possible        |

Note: \* Only possible in unit 0.

## 17.6 A/D Conversion Accuracy Definitions

This LSI's A/D conversion accuracy definitions are given below.

- **Resolution**  
The number of A/D converter digital output codes.
- **Quantization error**  
The deviation inherent in the A/D converter, given by 1/2 LSB (see figure 17.9).
- **Offset error**  
The deviation of the analog input voltage value from the ideal A/D conversion characteristic when the digital output changes from the minimum voltage value B'000000000 (H'000) to B'000000001 (H'001) (see figure 17.10).
- **Full-scale error**  
The deviation of the analog input voltage value from the ideal A/D conversion characteristic when the digital output changes from B'111111110 (H'3FE) to B'111111111 (H'3FF) (see figure 17.10).
- **Nonlinearity error**  
The error with respect to the ideal A/D conversion characteristic between the zero voltage and the full-scale voltage. Does not include the offset error, full-scale error, or quantization error (see figure 17.10).
- **Absolute accuracy**  
The deviation between the digital value and the analog input value. Includes the offset error, full-scale error, quantization error, and nonlinearity error.

**Figure 17.9 A/D Conversion Accuracy Definitions**

**Figure 17.10 A/D Conversion Accuracy Definitions**

## 17.7 Usage Notes

### 17.7.1 Module Stop Function Setting

Operation of the A/D converter can be disabled or enabled using the module stop control register. The initial setting is for operation of the A/D converter to be halted. Register access is enabled by clearing the module stop state. Set the CKS1 and CKS2 bits to 1 to set ADCLK to  $\phi$ , and clear the ADST, TRGS1, TRGS0, and EXTRGS bits all to 0 to disable A/D conversion when entering module stop state after operation of the A/D converter. After that, set the module stop control register after executing a dummy read by one word. For details, see section 23, Power-Down Modes.

### 17.7.2 A/D Input Hold Function in Software Standby Mode

When this LSI enters software standby mode with A/D conversion enabled, the analog inputs are retained, and the analog power supply current is equal to as during A/D conversion. If the analog power supply current needs to be reduced in software standby mode, set the CKS1 and CKS2 bits to 1 to set ADCLK to  $\phi$ , and clear the ADST, TRGS1, TRGS0, and EXTRGS bits all to 0 to disable A/D conversion. After that, enter software standby mode after executing a dummy read by one word.

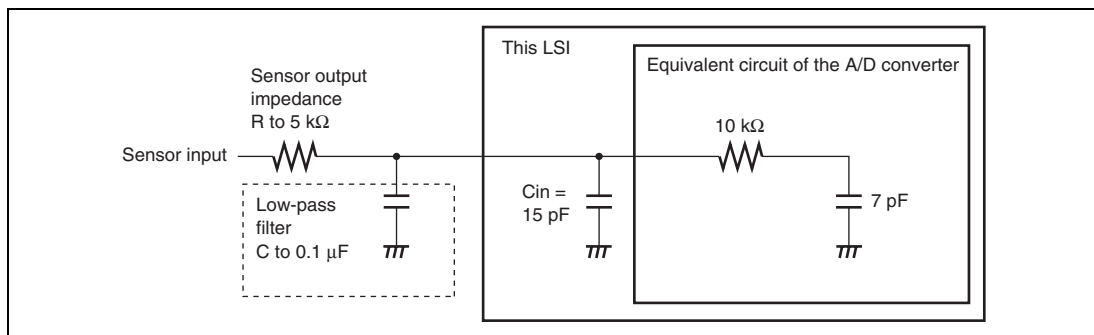

### 17.7.3 Restarting the A/D Converter

When the ADST bit has been cleared to 0, A/D converter stops in synchronization with the ADCLK and then enters the standby state. After the ADST bit has been cleared, the converter may not actually make the transition to the standby state for up to 10 cycles ( $\phi$ ), so do not change the channels of the ADCLK, motion mode, or analog input at this time.

When restarting the A/D converter right after the ADST bit has been cleared to 0, read the 16 bytes from ADDRA to ADDRH and then start the A/D converter by setting the ADST bit to 1. If the converter is in single mode or one-cycle scan mode, however, the ADST bit can be set to 1 by clearing the ADF bit to 0 after confirming that the ADF bit had been set to 1 on completion of the previous round of conversion.

### 17.7.4 Permissible Signal Source Impedance

This LSI's analog input is designed so that the conversion accuracy is guaranteed for an input signal for which the signal source impedance is  $5\text{ k}\Omega$  or less. This specification is provided to enable the A/D converter's sample-and-hold circuit input capacitance to be charged within the sampling time; if the sensor output impedance exceeds  $5\text{ k}\Omega$ , charging may be insufficient and it may not be possible to guarantee the A/D conversion accuracy. However, if a large capacitance is provided externally for conversion in single mode, the input load will essentially comprise only the internal input resistance of  $5\text{ k}\Omega$ , and the signal source impedance is ignored. However, since a low-pass filter effect is obtained in this case, it may not be possible to follow an analog signal with a large differential coefficient (e.g.,  $5\text{ mV}/\mu\text{s}$  or greater) (see figure 17.11). When converting a high-speed analog signal or conversion in scan mode, a low-impedance buffer should be inserted.

**Figure 17.11 Example of Analog Input Circuit**

### 17.7.5 Influences on Absolute Accuracy

Adding capacitance results in coupling with GND, and therefore noise in GND may adversely affect absolute accuracy. Be sure to make the connection to an electrically stable GND such as AVss.

Care is also required to insure that filter circuits do not communicate with digital signals on the mounting board, acting as antennas.

### 17.7.6 Setting Range of Analog Power Supply and Other Pins

If the conditions shown below are not met, the reliability of the LSI may be adversely affected.

- Analog input voltage range  
The voltage applied to analog input pin ANn during A/D conversion should be in the range  $AV_{SS} \leq V_{AN} \leq V_{ref}$ .
- Relation between AVss and Vss, and AVcc and Vcc  
As the relationship between AVss and Vss, set  $AV_{SS} = V_{SS}$ . If the A/D converter is not used, set  $AV_{CC} = V_{CC}$  and  $AV_{SS} = V_{SS}$ .
- Vref setting range  
The reference voltage at the Vref pin should be set in the range  $V_{ref} \leq AV_{CC}$ .

### 17.7.7 Notes on Board Design

In board design, digital circuitry and analog circuitry should be as mutually isolated as possible, and layout in which digital circuit signal lines and analog circuit signal lines cross or are in close proximity should be avoided as far as possible. Failure to do so may result in incorrect operation of the analog circuitry due to inductance, adversely affecting A/D conversion values.

Digital circuitry must be isolated from the analog input pins (AN0 to AN15\*), analog reference power supply ( $V_{ref}$ ), and analog power supply ( $AV_{cc}$ ) by the analog ground ( $AV_{ss}$ ). Also, the analog ground ( $AV_{ss}$ ) should be connected at one point to a stable ground ( $V_{ss}$ ) on the board.

Note: \* In the H8S/2424 group, only AN0 to AN7, AN11, and AN12 are available as analog input pins.

### 17.7.8 Notes on Noise Countermeasures

A protection circuit connected to prevent damage due to an abnormal voltage such as an excessive surge at the analog input pins (AN0 to AN15\*) should be connected between  $AV_{cc}$  and  $AV_{ss}$  as shown in figure 17.12. Also, the bypass capacitors connected to  $AV_{cc}$  and the filter capacitor connected to the AN0 to AN11 pins must be connected to  $AV_{ss}$ .

If a filter capacitor is connected, the input currents at the AN0 to AN15\* pins are averaged, and so an error may arise. Also, when A/D conversion is performed frequently, as in scan mode, if the current charged and discharged by the capacitance of the sample-and-hold circuit in the A/D converter exceeds the current input via the input impedance ( $R_{in}$ ), an error will arise in the analog input pin voltage. Careful consideration is therefore required when deciding the circuit constants.

Note: \* In the H8S/2424 group, only AN0 to AN7, AN11, and AN12 are available as analog input pins.

**Figure 17.12 Example of Analog Input Protection Circuit**

**Table 17.9 Analog Pin Specifications**

| Item                                | Min. | Max. | Unit |
|-------------------------------------|------|------|------|
| Analog input capacitance            | —    | 15   | pF   |
| Permissible signal source impedance | —    | 5    | kΩ   |

### 17.7.9 Concurrent Operation of Two A/D Converters

When operating two A/D converters concurrently, if conversion by the two converters starts at different times, the accuracy of conversion may be affected by crosstalk between the two converters.

When converter Y starts A/D conversion during the period indicated by  $T_{X-Y}$  in figure 17.13 below after the start of A/D conversion by converter X, and conversion by converter X is completed while conversion by converter Y is still in progress, the accuracy of A/D conversion may not be guaranteed.

When operating two A/D converters concurrently, be sure to conduct adequate evaluation in advance.

Note: X and Y in "converter X" and "converter Y" indicate either pair of 0 and 1.

**Figure 17.13 An Example of Timing Where Accuracy of A/D Conversion is not Guaranteed**

**Table 17.10 Difference in Time When A/D Conversion Starts ( $T_{X-Y}$ ) in Figure 17.13**

| $T_{X-Y}$ | Unit         |
|-----------|--------------|
| 0 to 10   | ADCLK cycles |

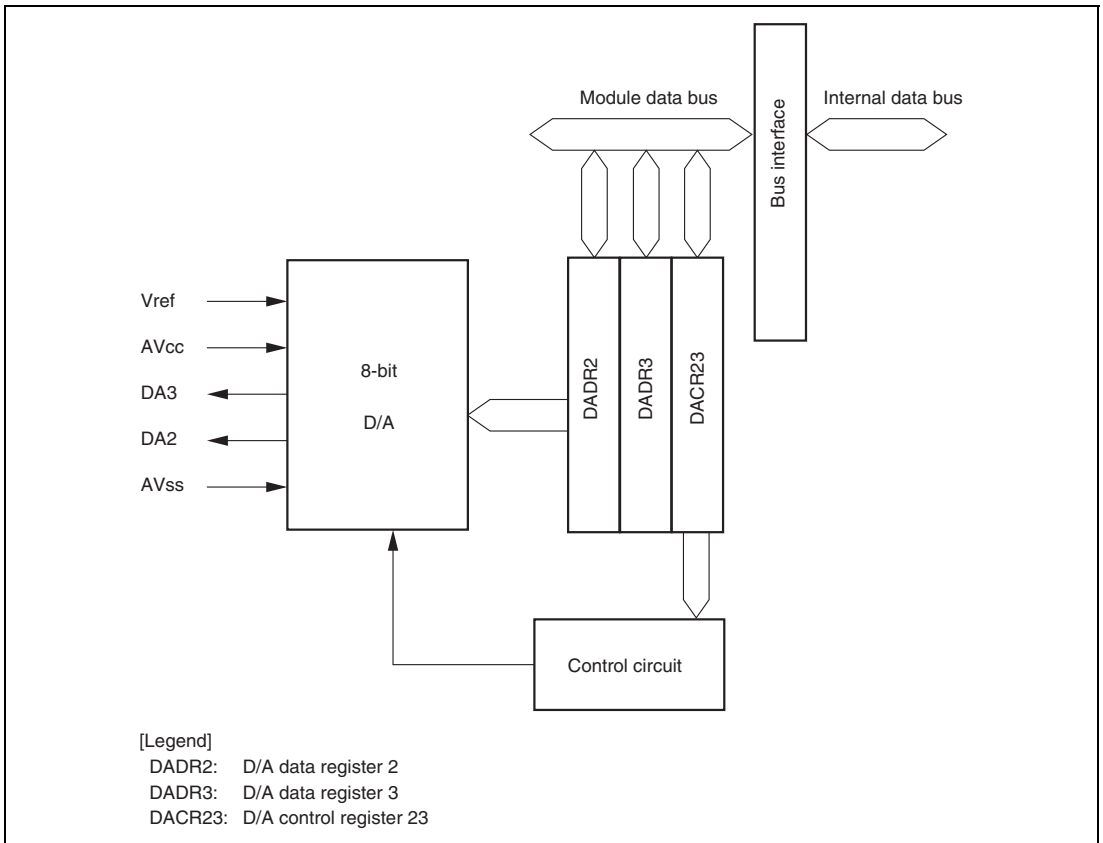

## Section 18 D/A Converter

### 18.1 Features

D/A converter features are listed below.

- 8-bit resolution
- Output channels: Two channels
- Maximum conversion time of 10  $\mu$ s (with 20 pF load)
- Output voltage of 0 V to  $V_{ref}$
- D/A output hold function in software standby mode
- Module stop state can be set.

**Figure 18.1 Block Diagram of D/A Converter**

## 18.2 Input/Output Pins

Table 18.1 shows the pin configuration of the D/A converter.

**Table 18.1 Pin Configuration**

| <b>Pin Name</b>       | <b>Symbol</b> | <b>I/O</b> | <b>Function</b>                    |
|-----------------------|---------------|------------|------------------------------------|
| Analog power pin      | $AV_{CC}$     | Input      | Analog power                       |
| Analog ground pin     | $AV_{SS}$     | Input      | Analog ground                      |
| Reference voltage pin | Vref          | Input      | Reference voltage of D/A converter |
| Analog output pin 2   | DA2           | Output     | Channel 2 analog output            |
| Analog output pin 3   | DA3           | Output     | Channel 3 analog output            |

## 18.3 Register Descriptions

The D/A converter has the following registers.

- D/A data register 2 (DADR2)
- D/A data register 3 (DADR3)
- D/A control register 23 (DACR23)

### 18.3.1 D/A Data Registers 2 and 3 (DADR2 and DADR3)

DADR2 and DADR3 are 8-bit readable/writable registers that store data for conversion.

Whenever analog output is enabled, the values in DADR are converted and output to the analog output pins.

### 18.3.2 D/A Control Register 23 (DACR23)

DACR23 controls the operation of channels 2 and 3 in the D/A converter.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | DAOE3    | 0             | R/W | D/A Output Enable 3<br>Controls D/A conversion and analog output.<br>0: Channel 3 analog output (DA3) is disabled.<br>1: Channel 3 D/A conversion is enabled; channel 3 analog output (DA3) is enabled. |
| 6   | DAOE2    | 0             | R/W | D/A Output Enable 2<br>Controls D/A conversion and analog output.<br>0: Channel 2 analog output (DA2) is disabled.<br>1: Channel 2 D/A conversion is enabled; channel 2 analog output (DA2) is enabled. |

| Bit    | Bit Name | Initial Value | R/W | Description   |
|--------|----------|---------------|-----|---|
| 5      | DAE      | 0             | R/W | <p>D/A Enable</p> <p>This bit is used together with the DAOE2 and DAOE3 bits to control D/A conversion. When the DAE bit is cleared to 0, channel 2 and 3 D/A conversions are controlled independently. When the DAE bit is set to 1, channel 2 and 3 D/A conversions are controlled together.</p> <p>Output of conversion results is always controlled independently by the DAOE2 and DAOE3 bits. For details, see table 18.2.</p> |
| 4 to 0 | —        | All 1         | —   | <p>Reserved</p> <p>These bits are always read as 1 and cannot be modified.</p>  |

**Table 18.2 Control of D/A Conversion**

| Bit 5<br>DAE | Bit 7<br>DAOE3 | Bit 6<br>DAOE2 | Description  |
|--------------|----------------|----------------|--|
| 0            | 0              | 0              | D/A conversion disabled  |
|              |                | 1              | Channel 2 D/A conversion enabled, and channel 3 D/A conversion disabled.<br>Channel 2 analog output (DA2) enabled, and channel 3 analog output (DA3) disabled. |
|              | 1              | 0              | Channel 2 D/A conversion disabled, and channel 3 D/A conversion enabled.<br>Channel 2 analog output (DA2) disabled, channel 3 analog output (DA3) enabled.     |
| 1            | 0              | 1              | Channel 2 and 3 D/A conversions enabled.<br>Channel 2 and 3 analog outputs (DA2 and DA3) enabled.  |
|              |                | 0              | Channel 2 and 3 D/A conversions enabled.<br>Channel 2 analog output (DA2) disabled, and channel 3 analog output (DA3) enabled.                                 |
|              | 1              | 0              | Channel 2 and 3 D/A conversions enabled.<br>Channel 2 analog output (DA2) disabled, and channel 3 analog output (DA3) disabled.                                |
|              |                | 1              | Channel 2 and 3 D/A conversions enabled.<br>Channel 2 analog output (DA2) enabled, and channel 3 analog output (DA3) disabled.                                 |
|              |                | 0              | Channel 2 and 3 D/A conversions enabled.<br>Channel 2 analog output (DA2) disabled, and channel 3 analog output (DA3) enabled.                                 |
| 1            | 1              | 0              | Channel 2 and 3 D/A conversions enabled.<br>Channel 2 analog output (DA2) disabled, and channel 3 analog output (DA3) disabled.                                |
|              |                | 1              | Channel 2 and 3 D/A conversions enabled.<br>Channel 2 and 3 analog outputs (DA2 and DA3) enabled.  |

## 18.4 Operation

The D/A converter includes D/A conversion circuits for two channels, each of which can operate independently. When DAOE bit in DACR23 is set to 1, D/A conversion is enabled and the conversion result is output. The following shows an example of D/A conversion on channel 2. Figure 18.2 shows the timing of this operation.

1. Write the conversion data to DADR2.
2. Set the DAOE2 bit in DACR23 to 1. D/A conversion is started. The conversion result is output from the analog output pin DA2 after the conversion time  $t_{\text{DCONV}}$  has elapsed. The conversion result is continued to output until DADR2 is written to again or the DAOE2 bit is cleared to 0. The output value is expressed by the following formula:

$$\frac{\text{DADR contents}}{256} \times V_{\text{ref}}$$

3. If DADR2 is written to again, the conversion is immediately started. The conversion result is output after the conversion time  $t_{\text{DCONV}}$  has elapsed.
4. If the DAOE2 bit is cleared to 0, analog output is disabled.

**Figure 18.2 Example of D/A Converter Operation**

## 18.5 Usage Notes

### 18.5.1 Module Stop Function Setting

D/A converter operation can be disabled or enabled using the module stop control register. The initial setting is for the D/A converter to be halted. Register access is enabled by clearing the module stop state. For details, see section 23, Power-Down Modes.

### 18.5.2 D/A Output Hold Function in Software Standby Mode

If D/A conversion is enabled and this LSI enters software standby mode, D/A output is held and analog power supply current remains at the same level during D/A conversion. When the analog power supply current is required to go low in software standby mode, bits DAOE and DAE should be cleared to 0, and D/A output should be disabled.

## Section 19 Synchronous Serial Communication Unit (SSU)

This LSI has one channel of synchronous serial communication unit (SSU). The SSU has master mode in which this LSI outputs clocks as a master device for synchronous serial communication and slave mode in which clocks are input from an external device for synchronous serial communication. Synchronous serial communication can be performed with devices having different clock polarity and clock phase. Figure 19.1 is a block diagram of the SSU.

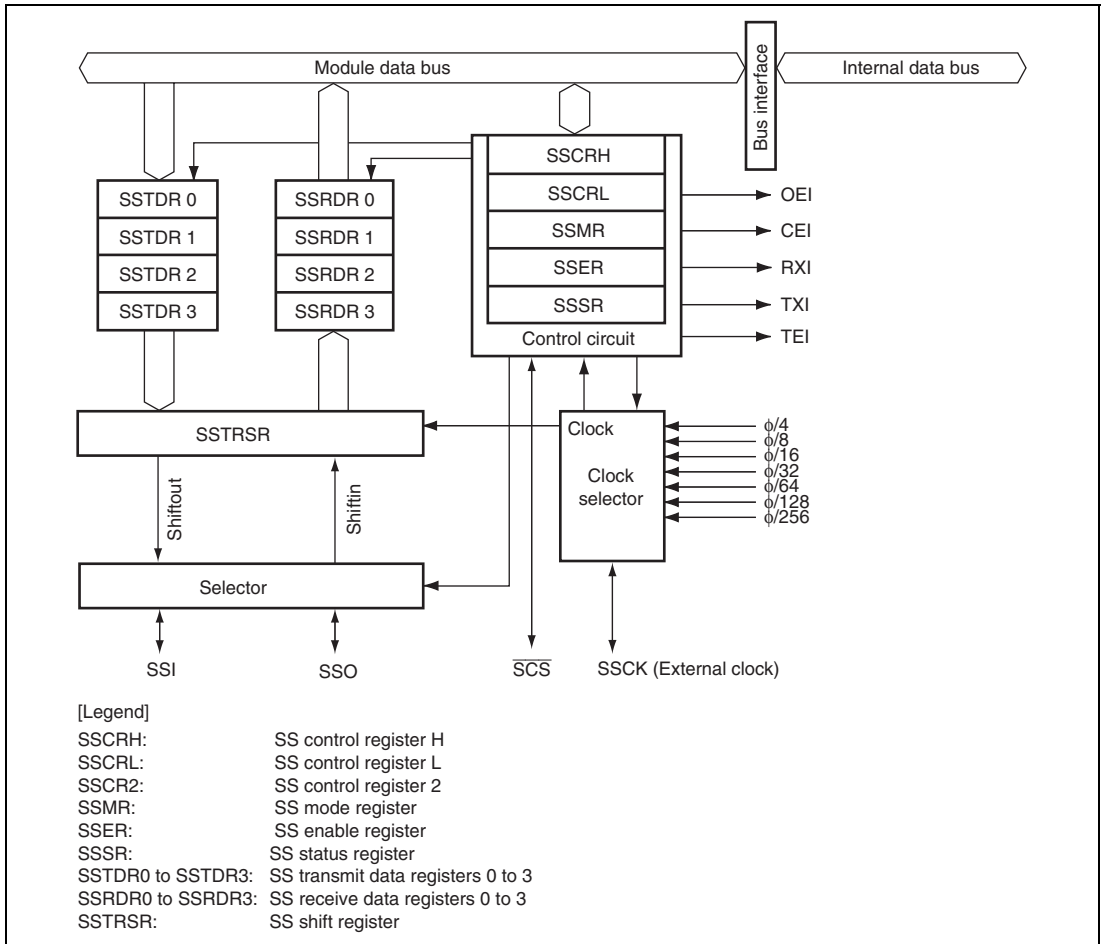

### 19.1 Features

- Choice of SSU mode and clock synchronous mode
- Choice of master mode and slave mode
- Choice of standard mode and bidirectional mode
- Synchronous serial communication with devices with different clock polarity and clock phase
- Choice of 8/16/24/32-bit width of transmit/receive data
- Full-duplex communication capability

The shift register is incorporated, enabling transmission and reception to be executed simultaneously.

- Consecutive serial communication
- Choice of LSB-first or MSB-first transfer
- Choice of a clock source  
Seven internal clocks ( $\phi/4$ ,  $\phi/8$ ,  $\phi/16$ ,  $\phi/32$ ,  $\phi/64$ ,  $\phi/128$ ,  $\phi/256$ ) or an external clock
- Five interrupt sources  
Transmit-end, transmit-data-register-empty, receive-data-full, overrun-error, and conflict error
- Module stop state can be set.

Figure 19.1 shows a block diagram of the SSU.

**Figure 19.1 Block Diagram of SSU**

## 19.2 Input/Output Pins

Table 19.1 shows the SSU pin configuration.

**Table 19.1 Pin Configuration**

| Channel | Symbol                   | I/O | Function                     |
|---------|--------------------------|-----|------------------------------|
| 0       | SSCK0                    | I/O | SSU clock input/output       |
|         | SSI0                     | I/O | SSU data input/output        |
|         | SSO0                     | I/O | SSU data input/output        |
|         | $\overline{\text{SCS}}0$ | I/O | SSU chip select input/output |

Note: \* Because channel numbers are omitted in later descriptions, these are shown SSCK, SSI, SSO, and  $\overline{\text{SCS}}$ .

## 19.3 Register Descriptions

The SSU has the following registers.

- SS control register H\_0 (SSCRH\_0)
- SS control register L\_0 (SSCRL\_0)
- SS mode register\_0 (SSMR\_0)
- SS enable register\_0 (SSER\_0)
- SS status register\_0 (SSSR\_0)
- SS control register 2\_0 (SSCR2\_0)
- SS transmit data register 0\_0 (SSTDR0\_0)
- SS transmit data register 1\_0 (SSTDR1\_0)
- SS transmit data register 2\_0 (SSTDR2\_0)
- SS transmit data register 3\_0 (SSTDR3\_0)
- SS receive data register 0\_0 (SSRDR0\_0)
- SS receive data register 1\_0 (SSRDR1\_0)
- SS receive data register 2\_0 (SSRDR2\_0)
- SS receive data register 3\_0 (SSRDR3\_0)
- SS shift register\_0 (SSTRSR\_0)

### 19.3.1 SS Control Register H (SSCRH)

SSCRH specifies master/slave device selection, bidirectional mode enable, SSO pin output value selection, SSCK pin selection, and  $\overline{\text{SCS}}$  pin selection.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | MSS      | 0             | R/W | <p>Master/Slave Device Select</p> <p>Selects that this module is used in master mode or slave mode. When master mode is selected, transfer clocks are output from the SSCK pin. When the CE bit in SSSR is set, this bit is automatically cleared.</p> <p>0: Slave mode is selected.</p> <p>1: Master mode is selected.</p>   |
| 6   | BIDE     | 0             | R/W | <p>Bidirectional Mode Enable</p> <p>Selects that both serial data input pin and output pin are used or one of them is used. However, transmission and reception are not performed simultaneously when bidirectional mode is selected. For details, section 19.4.3, Relationship between Data Input/Output Pins and Shift Register.</p> <p>0: Standard mode (two pins are used for data input and output)</p> <p>1: Bidirectional mode (one pin is used for data input and output)</p> |
| 5   | —        | 0             | R/W | <p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>  |

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 4   | SOL      | 0             | R/W | <p>Serial Data Output Value Select</p> <p>The serial data output retains its level of the last bit after completion of transmission. The output level before or after transmission can be specified by setting this bit. When specifying the output level, use the MOV instruction after clearing the SOLP bit to 0. Since writing to this bit during data transmission causes malfunctions, this bit should not be changed.</p> <p>0: Serial data output is changed to low.<br/>1: Serial data output is changed to high.</p>   |
| 3   | SOLP     | 1             | R/W | <p>SOL Bit Write Protect</p> <p>When changing the output level of serial data, set the SOL bit to 1 or clear the SOL bit to 0 after clearing the SOLP bit to 0 using the MOV instruction.</p> <p>0: Output level can be changed by the SOL bit<br/>1: Output level cannot be changed by the SOL bit. This bit is always read as 1.</p>   |
| 2   | SCKS     | 0             | R/W | <p>SSCK Pin Select</p> <p>Selects that the SSCK pin functions as a port or a serial clock pin. When the SSCK pin is used as a serial clock pin, this bit must be set to 1.</p> <p>0: Functions as an I/O port.<br/>1: Functions as a serial clock.</p>   |
| 1   | CSS1     | 0             | R/W | <p><math>\overline{\text{SCS}}</math> Pin Select</p>   |
| 0   | CSS0     | 0             | R/W | <p>Select that the <math>\overline{\text{SCS}}</math> pin functions as a port or <math>\overline{\text{SCS}}</math> input or output. However, when <math>\text{MSS} = 0</math>, the <math>\overline{\text{SCS}}</math> pin functions as an input pin regardless of the CSS1 and CSS0 settings.</p> <p>00: I/O port<br/>01: Function as <math>\overline{\text{SCS}}</math> input<br/>10: Function as <math>\overline{\text{SCS}}</math> automatic input/output (function as <math>\overline{\text{SCS}}</math> input before and after transfer and output a low level during transfer)<br/>11: Function as <math>\overline{\text{SCS}}</math> automatic output (outputs a high level before and after transfer and outputs a low level during transfer)</p> |

### 19.3.2 SS Control Register L (SSCRL)

SSCRL selects operating mode, software reset, and transmit/receive data length.

| Bit    | Bit Name | Initial Value | R/W | Description  |
|--------|----------|---------------|-----|--|
| 7      | —        | 0             | R/W | Reserved<br>This bit is always read as 0. The write value should always be 0.  |
| 6      | SSUMS    | 0             | R/W | Selects transfer mode from SSU mode and clock synchronous mode.<br>0: SSU mode<br>1: Clock synchronous mode  |
| 5      | SRES     | 0             | R/W | Software Reset<br>Setting this bit to 1 forcibly resets the SSU internal sequencer. After that, this bit is automatically cleared. The ORER, TEND, TDRE, RDRF, and CE bits in SSSR and the TE and RE bits in SSER are also initialized. Values of other bits for SSU registers are held.<br>To stop transfer, set this bit to 1 to reset the SSU internal sequencer. |
| 4 to 2 | —        | All 0         | R/W | Reserved<br>These bits are always read as 0. The write value should always be 0.   |
| 1      | DATS1    | 0             | R/W | Transmit/Receive Data Length Select  |
| 0      | DATS0    | 0             | R/W | Select serial data length.<br>00: 8 bits<br>01: 16 bits<br>10: 32 bits<br>11: 24 bits  |

### 19.3.3 SS Mode Register (SSMR)

SSMR selects the MSB first/LSB first, clock polarity, clock phase, and clock rate of synchronous serial communication.

| Bit  | Bit Name | Initial Value | R/W | Description  |
|------|----------|---------------|-----|--|
| 7    | MLS      | 0             | R/W | <p>MSB First/LSB First Select</p> <p>Selects that the serial data is transmitted in MSB first or LSB first.</p> <p>0: LSB first</p> <p>1: MSB first</p>  |
| 6    | CPOS     | 0             | R/W | <p>Clock Polarity Select</p> <p>Selects the SSCK clock polarity.</p> <p>0: High output in idle mode, and low output in active mode</p> <p>1: Low output in idle mode, and high output in active mode</p>   |
| 5    | CPHS     | 0             | R/W | <p>Clock Phase Select (Only for SSU Mode)</p> <p>Selects the SSCK clock phase.</p> <p>0: Data changes at the first edge.</p> <p>1: Data is latched at the first edge.</p>  |
| 4, 3 | —        | All 0         | R/W | <p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>  |
| 2    | CKS2     | 0             | R/W | Transfer Clock Rate Select   |
| 1    | CKS1     | 0             | R/W | Select the transfer clock rate when an internal clock is selected.   |
| 0    | CKS0     | 0             | R/W | <p>000: Reserved                      100: <math>\phi/32</math></p> <p>001: <math>\phi/4</math>                              101: <math>\phi/64</math></p> <p>010: <math>\phi/8</math>                              110: <math>\phi/128</math></p> <p>011: <math>\phi/16</math>                             111: <math>\phi/256</math></p> |

### 19.3.4 SS Enable Register (SSER)

SSER performs transfer/receive control of synchronous serial communication and setting of interrupt enable.

| Bit  | Bit Name | Initial Value | R/W | Description   |
|------|----------|---------------|-----|---|
| 7    | TE       | 0             | R/W | Transmit Enable<br>When this bit is set to 1, transmission is enabled.  |
| 6    | RE       | 0             | R/W | Receive Enable<br>When this bit is set to 1, reception is enabled.  |
| 5, 4 | —        | All 0         | R/W | Reserved<br>These bits are always read as 0. The write value should always be 0.  |
| 3    | TEIE     | 0             | R/W | Transmit End Interrupt Enable<br>When this bit is set to 1, a TEI interrupt request is enabled.                           |
| 2    | TIE      | 0             | R/W | Transmit Interrupt Enable<br>When this bit is set to 1, a TXI interrupt request is enabled.                               |
| 1    | RIE      | 0             | R/W | Receive Interrupt Enable<br>When this bit is set to 1, an RXI interrupt request and an OEI interrupt request are enabled. |
| 0    | CEIE     | 0             | R/W | Conflict Error Interrupt Enable<br>When this bit is set to 1, a CEI interrupt request is enabled.                         |

### 19.3.5 SS Status Register (SSSR)

SSSR is a status flag register for interrupts.

| Bit  | Bit Name | Initial Value | R/W | Description  |
|------|----------|---------------|-----|--|
| 7    | —        | 0             | —   | Reserved<br>This bit is always read as 0. The write value should always be 0.  |
| 6    | ORER     | 0             | R/W | Overrun Error<br>If the next data is received while RDRF = 1, an overrun error occurs, indicating abnormal termination. SSRDR stores 1-frame receive data before an overrun error occurs and loses data to be received later. While ORER = 1, consecutive serial reception cannot be continued. Serial transmission cannot be continued, either.<br>[Setting condition]<br>When one byte of the next reception is completed with RDRF = 1<br>[Clearing condition]<br>When writing 0 after reading ORER = 1<br>(When the CPU is used to clear this flag by writing 0 while the corresponding interrupt is enabled, be sure to read the flag after writing 0 to it.) |
| 5, 4 | —        | All 0         | R/W | Reserved<br>These bits are always read as 0. The write value should always be 0.   |

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 3   | TEND     | 1             | R   | <p>Transmit End</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> <li>When the last bit of transmit data is transmitted while the TENDSTS bit in SSCR2 is cleared to 0 and the TDRE bit is set to 1</li> <li>After the last bit of transmit data is transmitted while the TENDSTS bit in SSCR2 is set to 1 and the TDRE bit is set to 1</li> </ul> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> <li>When writing 0 after reading TEND = 1<br/>(When the CPU is used to clear this flag by writing 0 while the corresponding interrupt is enabled, be sure to read the flag after writing 0 to it.)</li> <li>When writing data to SSTDR</li> </ul> |
| 2   | TDRE     | 1             | R/W | <p>Transmit Data Empty</p> <p>Indicates whether or not SSTDR contains transmit data.</p> <p>[Setting conditions]</p> <ul style="list-style-type: none"> <li>When the TE bit in SSER is 0</li> <li>When data is transferred from SSTDR to SSTRSR and SSTDR is ready to be written to.</li> </ul> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> <li>When writing 0 after reading TDRE = 1<br/>(When the CPU is used to clear this flag by writing 0 while the corresponding interrupt is enabled, be sure to read the flag after writing 0 to it.)</li> <li>When writing data to SSTDR with TE = 1</li> </ul>  |
| 1   | RDRF     | 0             | R/W | <p>Receive Data Register Full</p> <p>Indicates whether or not SSRDR contains receive data.</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> <li>When receive data is transferred from SSTRSR to SSRDR after successful serial data reception</li> </ul> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> <li>When writing 0 after reading RDRF = 1<br/>(When the CPU is used to clear this flag by writing 0 while the corresponding interrupt is enabled, be sure to read the flag after writing 0 to it.)</li> <li>When reading receive data from SSRDR</li> </ul>   |

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 0   | CE       | 0             | R/W | <p>Conflict/Incomplete Error</p> <p>Indicates that a conflict error has occurred when 0 is externally input to the <math>\overline{\text{SCS}}</math> pin with SSUMS = 0 (SSU mode) and MSS = 1 (master device).</p> <p>If the <math>\overline{\text{SCS}}</math> pin level changes to 1 with SSUMS = 0 (SSU mode) and MSS = 0 (slave device), an incomplete error occurs because it is determined that a master device has terminated the transfer. Data reception does not continue while the CE bit is set to 1. Serial transmission also does not continue. Reset the SSU internal sequencer by setting the SRES bit in SSCRL to 1 before resuming transfer after incomplete error.</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> <li>• When a low level is input to the <math>\overline{\text{SCS}}</math> pin in master device (the MSS bit in SSCRH is set to 1)</li> <li>• When the <math>\overline{\text{SCS}}</math> pin is changed to 1 during transfer in slave device (the MSS bit in SSCRH is cleared to 0)</li> </ul> <p>[Clearing condition]</p> <ul style="list-style-type: none"> <li>• When writing 0 after reading CE = 1</li> </ul> <p>(When the CPU is used to clear this flag by writing 0 while the corresponding interrupt is enabled, be sure to read the flag after writing 0 to it.)</p> |

### 19.3.6 SS Control Register 2 (SSCR2)

SSCR2 is a register that enables/disables the open-drain outputs of the SSO, SSI, SSCK, and  $\overline{SCS}$  pins, selects the assert timing of the  $\overline{SCS}$  pin, data output timing of the SSO pin, and set timing of the TEND bit.

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | SDOS     | 0             | R/W | <p>Serial Data Pin Open Drain Select</p> <p>Selects whether the serial data output pin is used as a CMOS or an NMOS open drain output. Pins to output serial data differ according to the register setting. For details, 19.4.3, Relationship between Data Input/Output Pins and Shift Register.</p> <p>0: CMOS output<br/>1: NMOS open drain output</p> |
| 6   | SSCKOS   | 0             | R/W | <p>SSCK Pin Open Drain Select</p> <p>Selects whether the SSCK pin is used as a CMOS or an NMOS open drain output.</p> <p>0: CMOS output<br/>1: NMOS open drain output</p>  |
| 5   | SCSOS    | 0             | R/W | <p><math>\overline{SCS}</math> Pin Open Drain Select</p> <p>Selects whether the <math>\overline{SCS}</math> pin is used as a CMOS or an NMOS open drain output.</p> <p>0: CMOS output<br/>1: NMOS open drain output</p>  |
| 4   | TENDSTS  | 0             | R/W | <p>Selects the timing of setting the TEND bit (valid in SSU and master mode).</p> <p>0: Sets the TEND bit when the last bit is being transmitted<br/>1: Sets the TEND bit after the last bit is transmitted</p>  |

| Bit  | Bit Name | Initial Value | R/W | Description   |
|------|----------|---------------|-----|---|
| 3    | SCSATS   | 0             | R/W | <p>Selects the assertion timing of the <math>\overline{\text{SCS}}</math> pin (valid in SSU and master mode).</p> <p>0: Min. values of <math>t_{\text{LEAD}}</math> and <math>t_{\text{LAG}}</math> are <math>1/2 \times t_{\text{SUcyc}}</math></p> <p>1: Min. values of <math>t_{\text{LEAD}}</math> and <math>t_{\text{LAG}}</math> are <math>3/2 \times t_{\text{SUcyc}}</math></p> |
| 2    | SSODTS   | 0             | R/W | <p>Selects the data output timing of the SSO pin (valid in SSU and master mode)</p> <p>0: While BIDE = 0, MSS = 1, and TE = 1 or while BIDE = 1, TE = 1, and RE = 0, the SSO pin outputs data</p> <p>1: While BIDE = 0, MSS = 1, and TE = 1 or while BIDE = 1, TE = 1, and RE = 0, the SSO pin outputs data while the SCS pin is driven low</p>   |
| 1, 0 | —        | All 0         | R/W | <p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>   |

### 19.3.7 SS Transmit Data Registers 0 to 3 (SSTDR0 to SSTDR3)

SSTDR is an 8-bit register that stores transmit data. When 8-bit data length is selected by bits DATS1 and DATS0 in SSCRL, SSTDR0 is valid. When 16-bit data length is selected, SSTDR0 and SSTDR1 are valid. When 24-bit data length is selected, SSTDR0, SSTDR1, and SSTDR2 are valid. When 32-bit data length is selected, SSTDR0 to SSTDR3 are valid. Be sure not to access to invalid SSTDRs.

When the SSU detects that SSTRSR is empty, it transfers the transmit data written in SSTDR to SSTRSR and starts serial transmission. If the next transmit data has already been written to SSTDR during serial transmission, the SSU performs consecutive serial transmission.

Although SSTDR can always be read from or written to by the CPU and DMAC, to achieve reliable serial transmission, write transmit data to SSTDR after confirming that the TDRE bit in SSSR is set to 1.

**Table 19.2 Correspondence Between DATS Bit Setting and SSTDR**

| SSTDR | DATS[1:0] (SSCRL[1:0]) |         |       |                      |
|-------|------------------------|---------|-------|----------------------|
|       | 00                     | 01      | 10    | 11 (Setting Invalid) |
| 0     | Valid                  | Valid   | Valid | Valid                |
| 1     | Invalid                | Valid   | Valid | Valid                |
| 2     | Invalid                | Invalid | Valid | Valid                |
| 3     | Invalid                | Invalid | Valid | Invalid              |

### 19.3.8 SS Receive Data Registers 0 to 3 (SSRDR0 to SSRDR3)

SSRDR is an 8-bit register that stores receive data. When 8-bit data length is selected by bits DATS1 and DATS0 in SSCRL, SSRDR0 is valid. When 16-bit data length is selected, SSRDR0 and SSRDR1 are valid. When 24-bit data length is selected, SSRDR0, SSRDR1, and SSRDR2 are valid. When 32-bit data length is selected, SSRDR0 to SSRDR3 are valid. Be sure not to access to invalid SSRDR.

When the SSU has received 1-byte data, it transfers the received serial data from SSTRSR to SSRDR where it is stored. After this, SSTRSR is ready for reception. Since SSTRSR and SSRDR function as a double buffer in this way, consecutive receive operations can be performed.

Read SSRDR after confirming that the RDRF bit in SSSR is set to 1.

SSRDR is a read-only register, therefore, cannot be written to by the CPU.

**Table 19.3 Correspondence Between DATS Bit Setting and SSRDR**

| SSRDR | DATS[1:0] (SSCRL[1:0]) |         |       |                      |
|-------|------------------------|---------|-------|----------------------|
|       | 00                     | 01      | 10    | 11 (Setting Invalid) |
| 0     | Valid                  | Valid   | Valid | Valid                |
| 1     | Invalid                | Valid   | Valid | Valid                |
| 2     | Invalid                | Invalid | Valid | Valid                |
| 3     | Invalid                | Invalid | Valid | Invalid              |

### 19.3.9 SS Shift Register (SSTRSR)

SSTRSR is a shift register that transmits and receives serial data.

When data is transferred from SSTDR to SSTRSR, bit 0 of transmit data is bit 0 in the SSTDR contents (MLS = 0: LSB first communication) and is bit 7 in the SSTDR contents (MLS = 1: MSB first communication). The SSU transfers data from the LSB (bit 0) in SSTRSR to the SSO pin to perform serial data transmission.

In reception, the SSU sets serial data that has been input via the SSI pin in SSTRSR from the LSB (bit 0). When 1-byte data has been received, the SSTRSR contents are automatically transferred to SSRDR. SSTRSR cannot be directly accessed by the CPU.

## 19.4 Operation

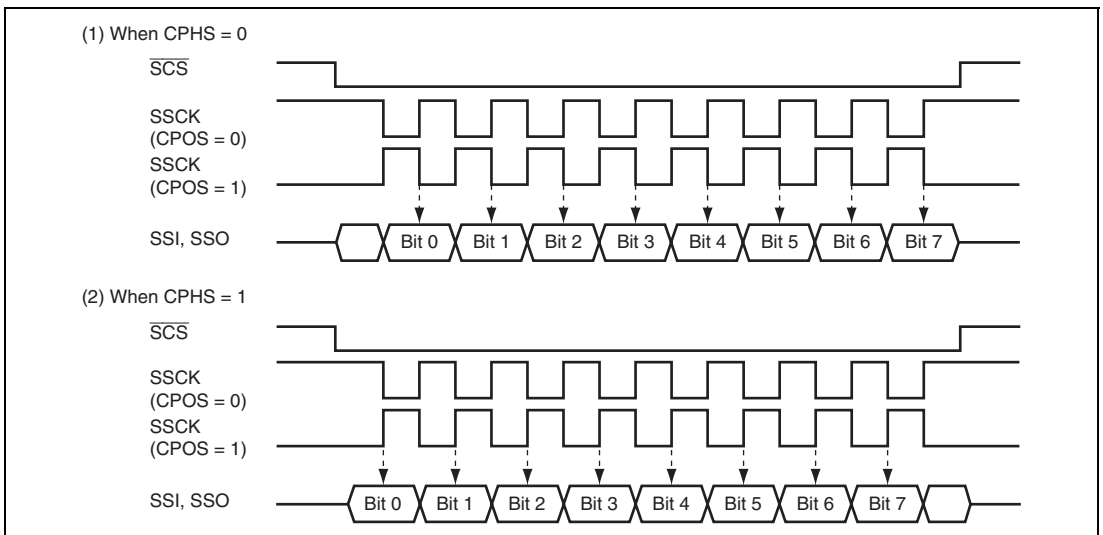

### 19.4.1 Transfer Clock

A transfer clock can be selected from eight internal clocks and an external clock. When using this module, set the SCKS bit in SSCRH to 1 to select the SSCK pin as a serial clock. When the MSS bit in SSCRH is 1, an internal clock is selected and the SSCK pin is used as an output pin. When transfer is started, the clock with the transfer rate set by bits CKS2 to CKS0 in SSMR is output from the SSCK pin. When MSS = 0, an external clock is selected and the SSCK pin is used as an input pin.

### 19.4.2 Relationship of Clock Phase, Polarity, and Data

The relationship of clock phase, polarity, and transfer data depends on the combination of the CPOS and CPHS bits in SSMR. Figure 19.2 shows the relationship. When SSUMS = 1, the CPHS setting is invalid although the CPOS setting is valid.

Setting the MLS bit in SSMR selects that MSB or LSB first communication. When MLS = 0, data is transferred from the LSB to the MSB. When MLS = 1, data is transferred from the MSB to the LSB.

**Figure 19.2 Relationship of Clock Phase, Polarity, and Data**

### 19.4.3 Relationship between Data Input/Output Pins and Shift Register

The connection between data input/output pins and the SS shift register (SSTRSR) depends on the combination of the MSS and BIDE bits in SSCRH and the SSUMS bit in SSCRL. Figure 19.3 shows the relationship.

The SSU transmits serial data from the SSO pin and receives serial data from the SSI pin when operating with BIDE = 0 and MSS = 1 (standard, master mode) (see figure 19.3 (1)). The SSU transmits serial data from the SSI pin and receives serial data from the SSO pin when operating with BIDE = 0 and MSS = 0 (standard, slave mode) (see figure 19.3 (2)).

The SSU transmits and receives serial data from the SSO pin regardless of master or slave mode when operating with BIDE = 1 (bidirectional mode) (see figures 19.3 (3) and (4)).

However, even if both the TE and RE bits are set to 1, transmission and reception are not performed simultaneously. Either the TE or RE bit must be selected.

The SSU transmits serial data from the SSO pin and receives serial data from the SSI pin when operating with SSUMS = 1. The SCK pin outputs the internal clock when MSS = 1 and function as an input pin when MSS = 0 (see figures 19.3 (5) and (6)).

**Figure 19.3 Relationship between Data Input/Output Pins and the Shift Register**

### 19.4.4 Communication Modes and Pin Functions

The SSU switches the input/output pin (SSI, SSO, SSCK, and  $\overline{\text{SCS}}$ ) functions according to the communication modes and register settings. When a pin is used as an input pin, clear the corresponding bit in each data direction register (DDR) to 0. The relationship of communication modes and input/output pin functions are shown in tables 19.4 to 19.6.

**Table 19.4 Communication Modes and Pin States of SSI and SSO Pins**

| Communication Mode                   | Register Setting |      |     |    |       | Pin State |        |
|--------------------------------------|------------------|------|-----|----|-------|-----------|--------|
|                                      | SSUMS            | BIDE | MSS | TE | RE    | SSI       | SSO    |
| SSU communication mode               | 0                | 0    | 0   | 0  | 1     | —         | Input  |
|                                      |                  |      |     | 1  | 0     | Output    | —      |
|                                      | 1                | 0    | 0   | 0  | 1     | Output    | Input  |
|                                      |                  |      |     | 1  | 0     | —         | Output |
|                                      |                  |      |     | 0  | 1     | Input     | —      |
|                                      |                  |      |     | 1  | 0     | —         | Output |
| 1                                    | 1                | 0    | 0   | 1  | —     | Input     |        |
|                                      |                  |      | 1   | 0  | —     | Output    |        |
|                                      |                  |      | 0   | 1  | —     | Input     |        |
|                                      |                  |      | 1   | 0  | —     | Output    |        |

## 19.4.5 SSU Mode

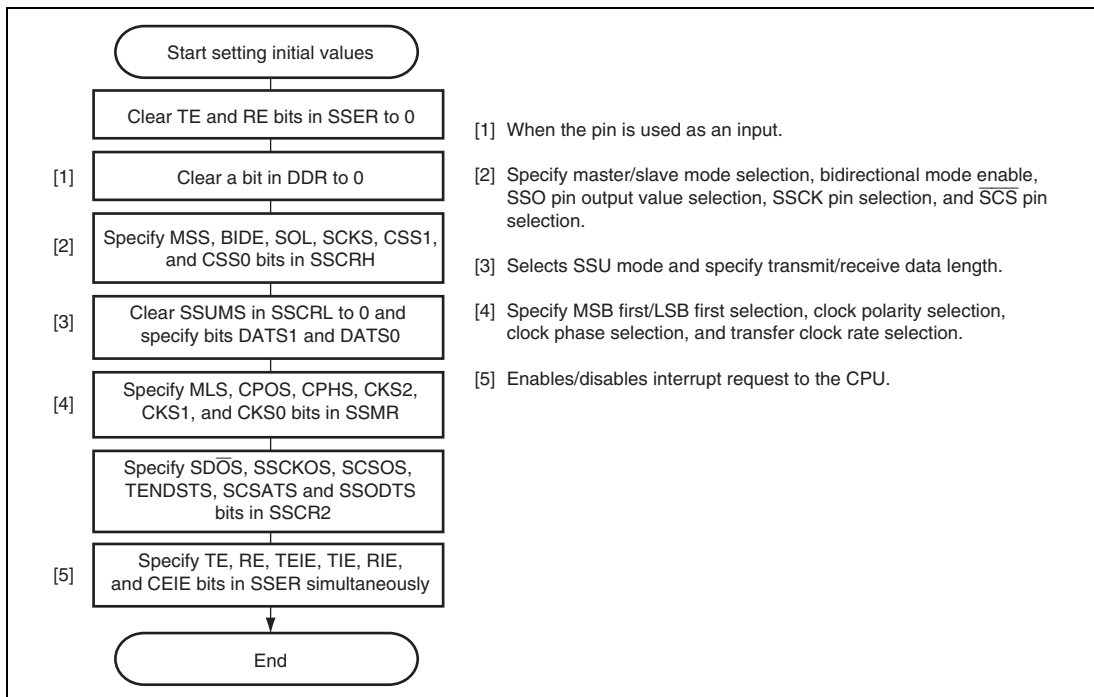

In SSU mode, data communications are performed via four lines: clock line (SSCK), data input line (SSI or SSO), data output line (SSI or SSO), and chip select line ( $\overline{\text{SCS}}$ ).

In addition, the SSU supports bidirectional mode in which a single pin functions as data input and data output lines.

### (1) Initial Settings in SSU Mode

Figure 19.4 shows an example of the initial settings in SSU mode. Before data transfer, clear both the TE and RE bits in SSER to 0 to set the initial values.

**Note:** Before changing operating modes and communications formats, clear both the TE and RE bits to 0. Although clearing the TE bit to 0 sets the TDRE bit to 1, clearing the RE bit to 0 does not change the values of the RDRF and ORER bits and SSRDR. Those bits retain the previous values.

**Figure 19.4 Example of Initial Settings in SSU Mode**

## (2) Data Transmission

Figure 19.5 shows an example of transmission operation, and figure 19.6 shows a flowchart example of data transmission.

When transmitting data, the SSU operates as shown below.

In master mode, the SSU outputs a transfer clock and data. In slave mode, when a low level signal is input to the SCS pin and a transfer clock is input to the SSCK pin, the SSU outputs data in synchronization with the transfer clock.

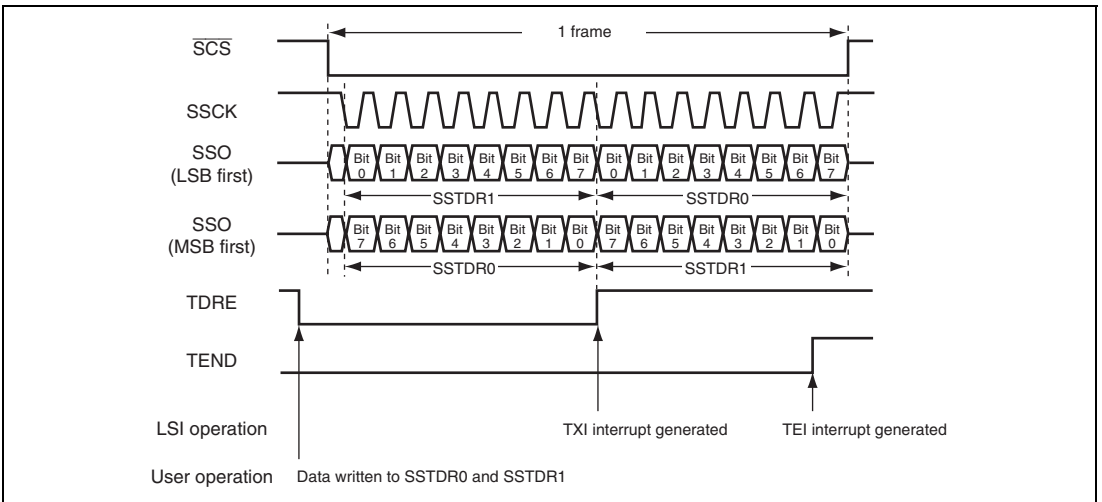

Writing transmit data to SSTDR after the TE bit is set to 1 clears the TDRE bit in SSSR to 0, and the SSTDR contents are transferred to SSTRSR. After that, the SSU sets the TDRE bit to 1 and starts transmission. At this time, if the TIE bit in SSER is set to 1, a TXI interrupt is generated.

When 1-frame data has been transferred with TDRE = 0, the SSTDR contents are transferred to SSTRSR to start the next frame transmission. When the 8th bit of transmit data has been transferred with TDRE = 1, the TEND bit in SSSR is set to 1 and the state is retained. At this time, if the TEIE bit is set to 1, a TEI interrupt is generated. After transmission, the output level of the SSCK pin is fixed high when CPOS = 0 and low when CPOS = 1.

While the ORER bit in SSSR is set to 1, transmission is not performed. Check that the ORER bit is cleared to 0.

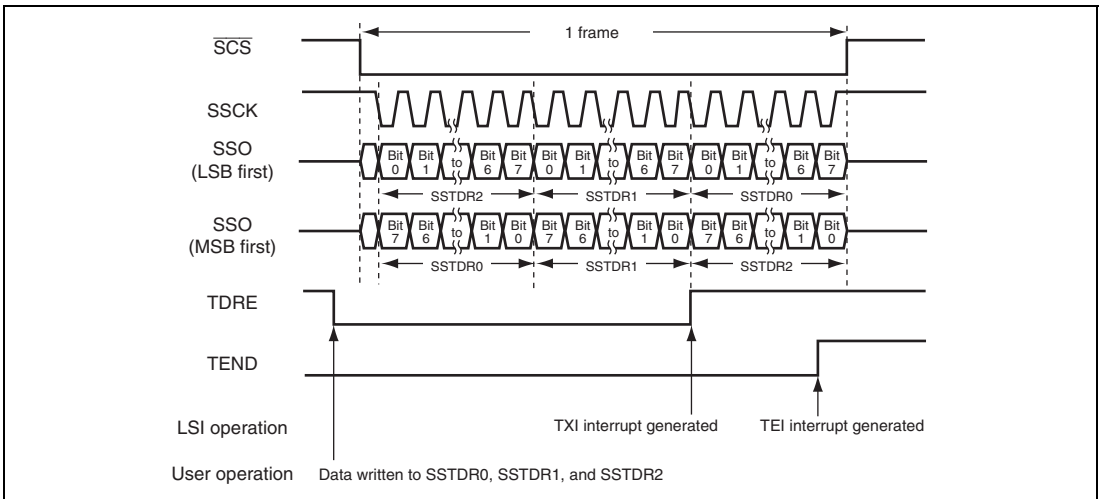

**Figure 19.5 (1) Example of Transmission Operation (SSU Mode) When 8-Bit Data Length is Selected (SSTDRO is Valid) with CPOS = 0 and CPHS = 0**

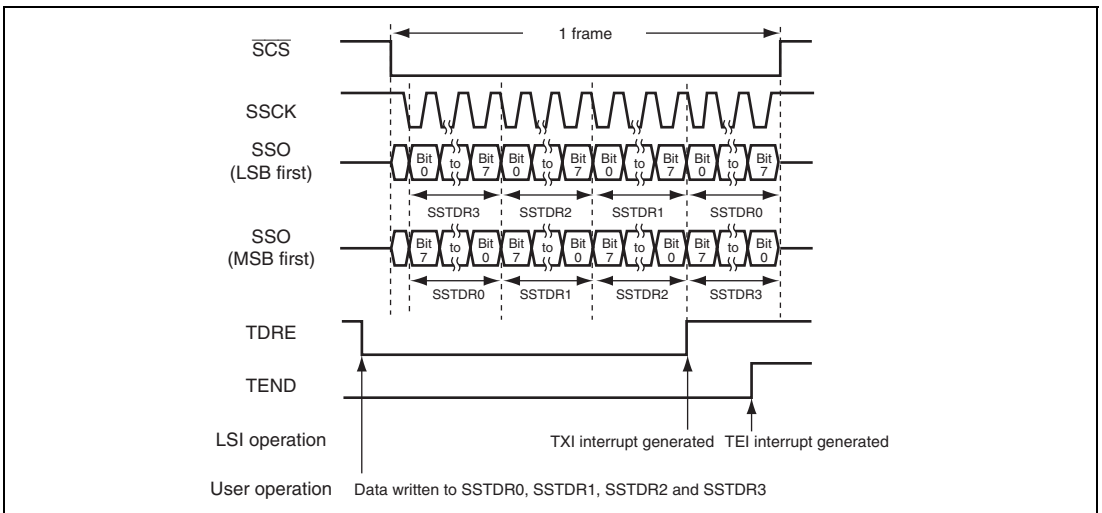

**Figure 19.5 (2) Example of Transmission Operation (SSU Mode) When 16-Bit Data Length is Selected (SSTDRO and SSTDRI are Valid) with CPOS = 0 and CPHS = 0**

**Figure 19.5 (3) Example of Transmission Operation (SSU Mode) When 24-Bit Data Length is Selected (SSTR0, SSTR1, and SSTR2 are Valid) with CPOS = 0 and CPHS = 0**

**Figure 19.5 (4) Example of Transmission Operation (SSU Mode) When 32-Bit Data Length is Selected (SSTR0, SSTR1, SSTR2 and SSTR3 are Valid) with CPOS = 0 and CPHS = 0**

**Figure 19.6 Flowchart Example of Data Transmission (SSU Mode)**

### (3) Data Reception

Figure 19.7 shows an example of reception operation, and figure 19.8 shows a flowchart example of data reception. When receiving data, the SSU operates as shown below.

After setting the RE bit to 1 and dummy-reading SSRDR, the SSU starts data reception.

In master mode, the SSU outputs a transfer clock and receives data. In slave mode, when a low level signal is input to the  $\overline{\text{SCS}}$  pin and a transfer clock is input to the SSCK pin, the SSU receives data in synchronization with the transfer clock.

When 1-frame data has been received, the RDRF bit in SSSR is set to 1 and the receive data is stored in SSRDR. At this time, if the RIE bit in SSER is set to 1, an RXI interrupt is generated. The RDRF bit is automatically cleared to 0 by reading SSRDR.

When the RDRF bit has been set to 1 at the 8th rising edge of the transfer clock, the ORER bit in SSSR is set to 1. This indicates that an overrun error (OEI) has occurred. At this time, data reception is stopped. While the ORER bit in SSSR is set to 1, reception is not performed. To resume the reception, clear the ORER bit to 0.

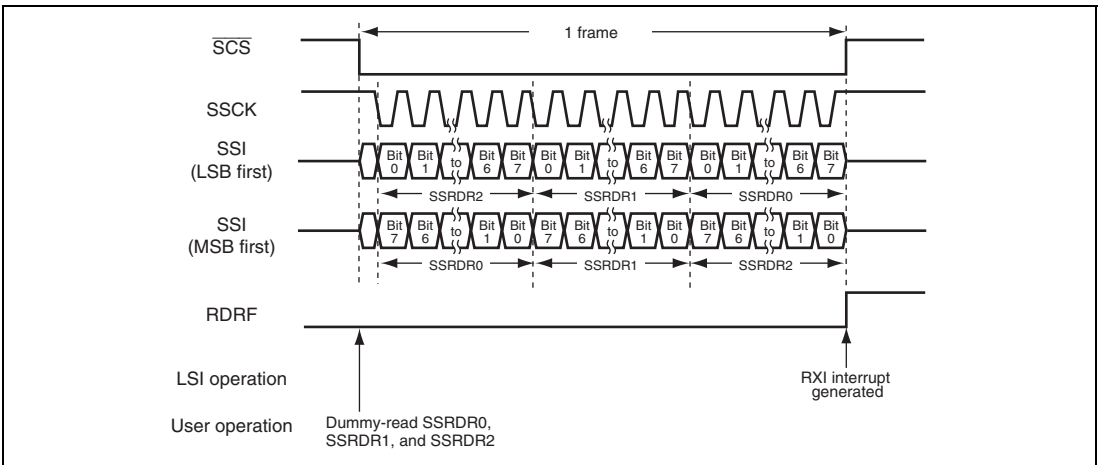

**Figure 19.7 (1) Example of Reception Operation (SSU Mode)**

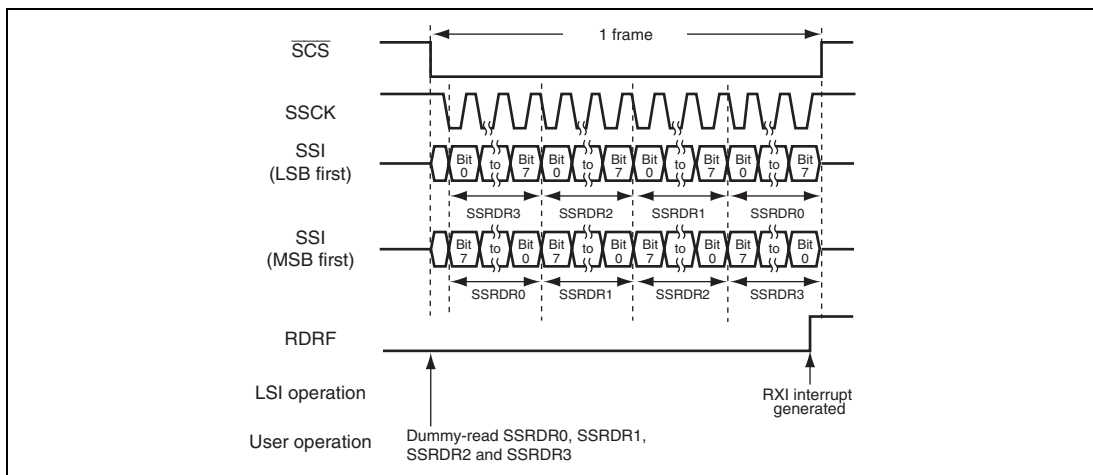

**When 8-Bit Data Length is Selected (SSRDR0 is Valid) with CPOS = 0 and CPHS = 0**

**Figure 19.7 (2) Example of Reception Operation (SSU Mode) When 16-Bit Data Length is Selected (SSRDR0 and SSRDR1 are Valid) with CPOS = 0 and CPHS = 0**

**Figure 19.7 Example of Reception Operation (SSU Mode) When 24-Bit Data Length is Selected (SSRDR0, SSRDR1, and SSRDR2 are Valid) with CPOS = 0 and CPHS = 0 (3)**

**Figure 19.7 Example of Reception Operation (SSU Mode)**  
**When 32-Bit Data Length is Selected (SSRDR0, SSRDR1, SSRDR2 and SSRDR3 are Valid)**  
**with CPOS = 0 and CPHS = 0 (4)**

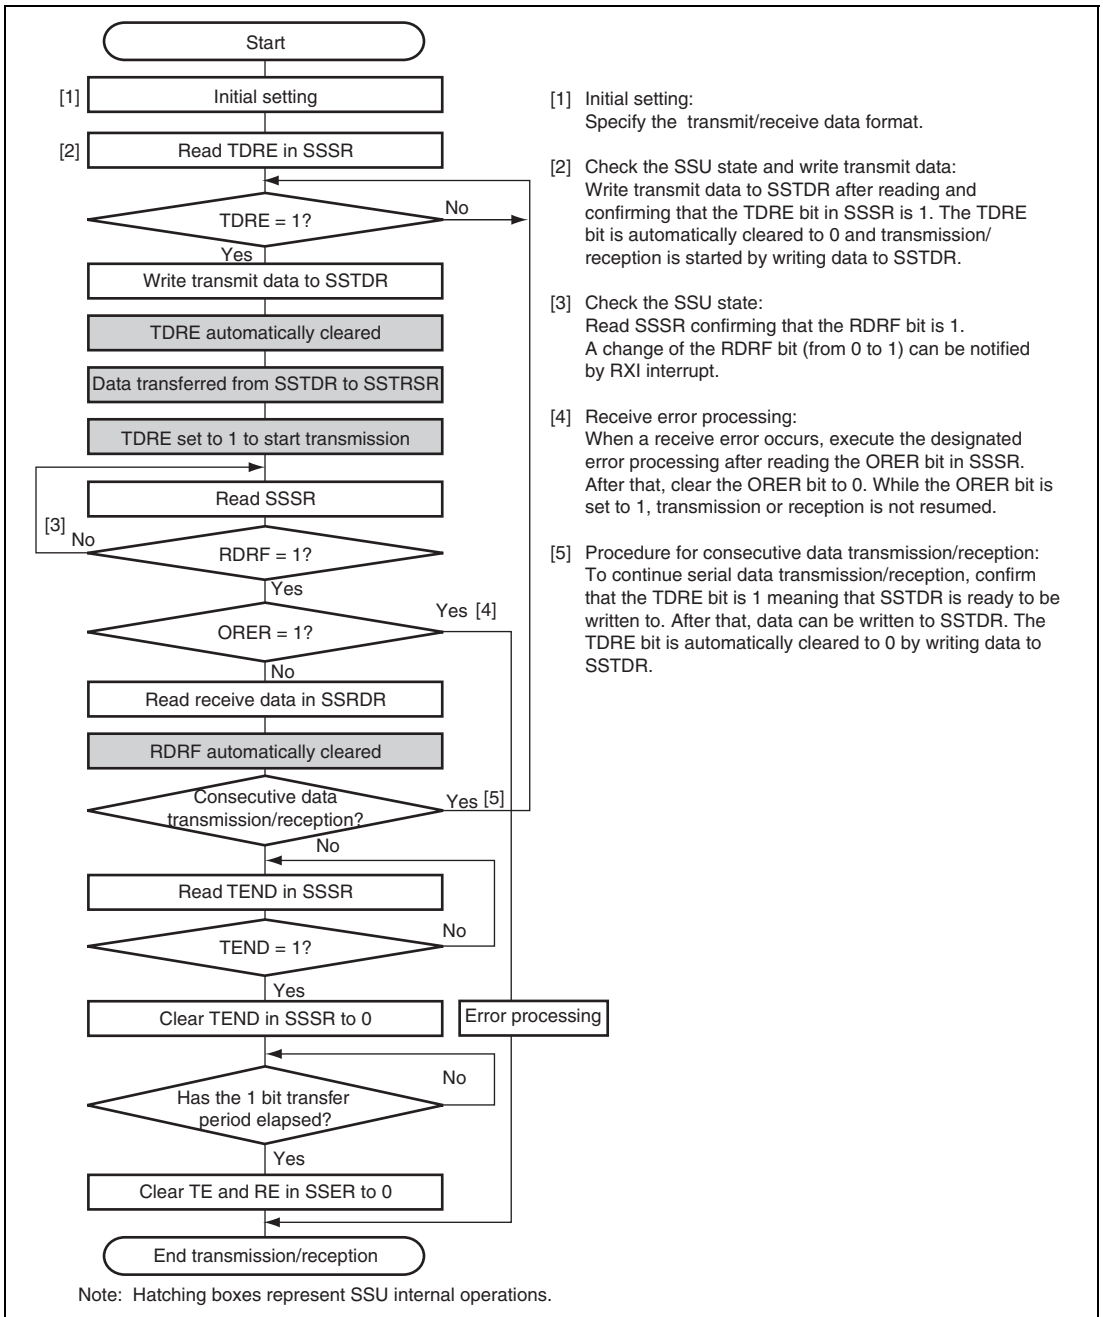

- [1] Initial setting:  
Specify the receive data format.
- [2] Start reception:  
When SSRDR is dummy-read with RE = 1, reception is started.
- [3], [6] Receive error processing:  
When a receive error occurs, execute the designated error processing after reading the ORER bit in SSSR. After that, clear the ORER bit to 0. While the ORER bit is set to 1, transmission or reception is not resumed.
- [4] To continue single reception:  
When continuing single reception, wait for time of  $t_{SUcyc}$  while the RDRF flag is set to 1 and then read receive data in SSRDR.  
The next single reception starts after reading receive data in SSRDR.
- [5] To complete reception:  
To complete reception, read receive data after clearing the RE bit to 0. When reading SSRDR without clearing the RE bit, reception is resumed.

**Figure 19.8 Flowchart Example of Data Reception (SSU Mode)**

#### (4) Data Transmission/Reception

Figure 19.9 shows a flowchart example of simultaneous transmission/reception. The data transmission/reception is performed combining the data transmission and data reception as mentioned above. The data transmission/reception is started by writing transmit data to SSTDR with  $TE = RE = 1$ .

Before switching transmission mode ( $TE = 1$ ) or reception mode ( $RE = 1$ ) to transmission/reception mode ( $TE = RE = 1$ ), clear the TE and RE bits to 0. When starting the transfer, confirm that the TEND, RDRF, and ORER bits are cleared to 0 before setting the TE or RE bit to 1.

- [1] Initial setting:  
Specify the transmit/receive data format.
- [2] Check the SSU state and write transmit data:  
Write transmit data to SSTDR after reading and confirming that the TDRE bit in SSSR is 1. The TDRE bit is automatically cleared to 0 and transmission/reception is started by writing data to SSTDR.
- [3] Check the SSU state:  
Read SSSR confirming that the RDRF bit is 1. A change of the RDRF bit (from 0 to 1) can be notified by RXI interrupt.
- [4] Receive error processing:  
When a receive error occurs, execute the designated error processing after reading the ORER bit in SSSR. After that, clear the ORER bit to 0. While the ORER bit is set to 1, transmission or reception is not resumed.
- [5] Procedure for consecutive data transmission/reception:  
To continue serial data transmission/reception, confirm that the TDRE bit is 1 meaning that SSTDR is ready to be written to. After that, data can be written to SSTDR. The TDRE bit is automatically cleared to 0 by writing data to SSTDR.

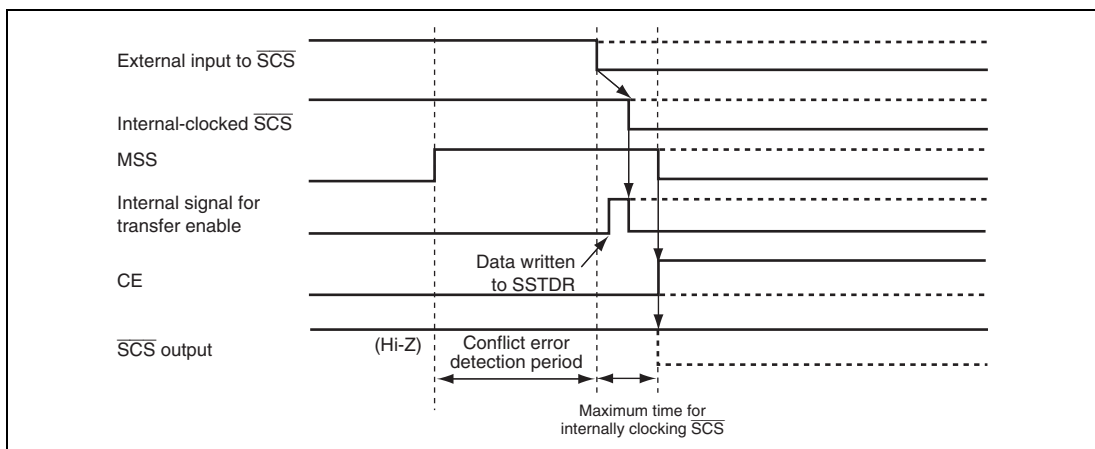

**Figure 19.9 Flowchart Example of Simultaneous Transmission/Reception (SSU Mode)**

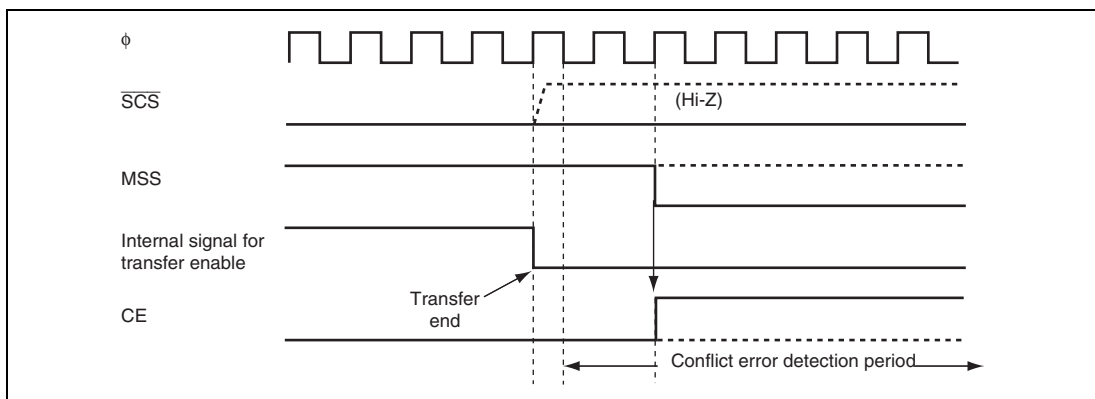

### 19.4.6 $\overline{\text{SCS}}$ Pin Control and Conflict Error

When bits CSS1 and CSS0 in SSCRH are specified to B'10 and the SSUMS bit in SSCRL is cleared to 0, the  $\overline{\text{SCS}}$  pin functions as an input (Hi-Z) to detect conflict error. The conflict detection period is from setting the MSS bit in SSCRH to 1 to starting serial transfer and after transfer ends. When a low level signal is input to the  $\overline{\text{SCS}}$  pin within the period, a conflict error occurs. At this time, the CE bit in SSSR is set to 1 and the MSS bit is cleared to 0.

Note: While the CE bit is set to 1, transmission or reception is not resumed. Clear the CE bit to 0 before resuming the transmission or reception.

**Figure 19.10 Conflict Error Detection Timing (Before Transfer)**

**Figure 19.11 Conflict Error Detection Timing (After Transfer End)**

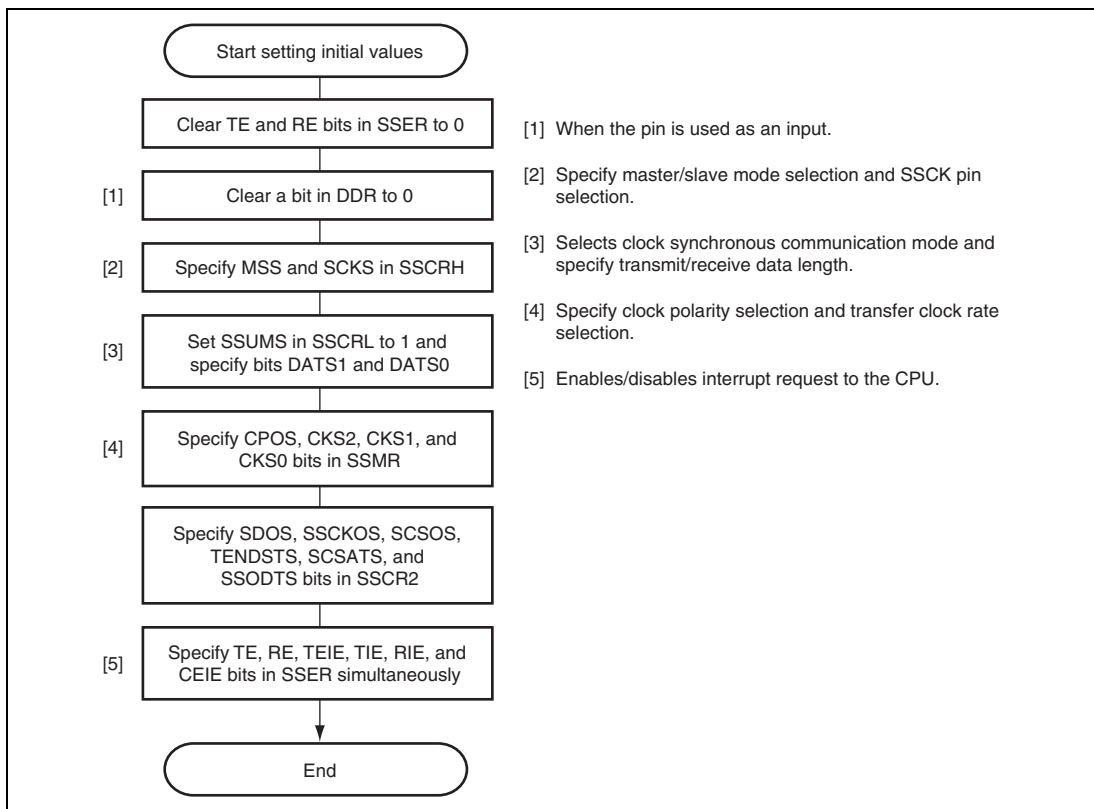

## 19.4.7 Clock Synchronous Communication Mode

In clock synchronous communication mode, data communications are performed via three lines: clock line (SSCK), data input line (SSI), and data output line (SSO).

### (1) Initial Settings in Clock Synchronous Communication Mode

Figure 19.12 shows an example of the initial settings in clock synchronous communication mode. Before data transfer, clear both the TE and RE bits in SSER to 0 to set the initial values.

**Note:** Before changing operating modes and communications formats, clear both the TE and RE bits to 0. Although clearing the TE bit to 0 sets the TDRE bit to 1, clearing the RE bit to 0 does not change the values of the RDRF and ORER bits and SSRDR. Those bits retain the previous values.

**Figure 19.12 Example of Initial Settings in Clock Synchronous Communication Mode**

## (2) Data Transmission

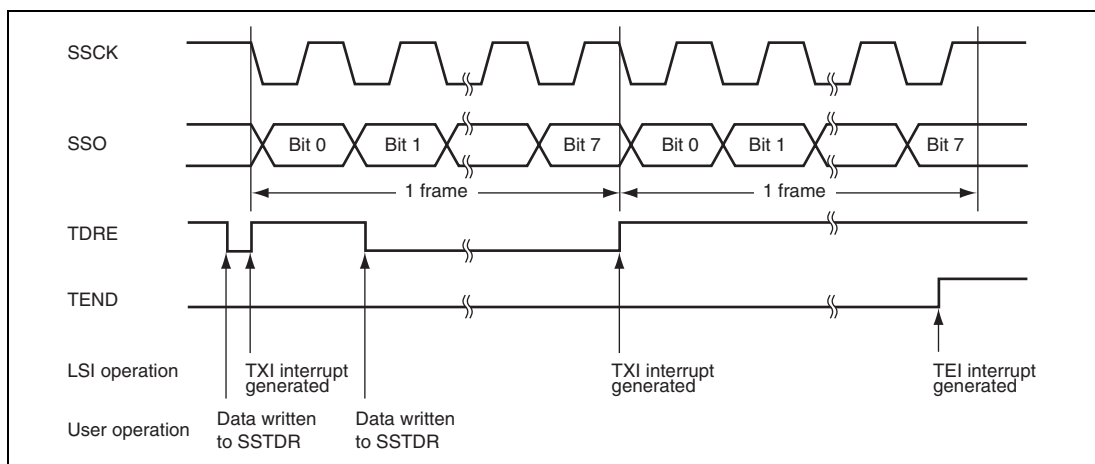

Figure 19.13 shows an example of transmission operation, and figure 19.14 shows a flowchart example of data transmission. When transmitting data in clock synchronous communication mode, the SSU operates as shown below.

In master mode, the SSU outputs a transfer clock and data. In slave mode, when a transfer clock is input to the SSCK pin, the SSU outputs data in synchronization with the transfer clock.

Writing transmit data to SSTDR after the TE bit is set to 1 clears the TDRE bit in SSSR to 0, and the SSTDR contents are transferred to SSTRSR. After that, the SSU sets the TDRE bit to 1 and starts transmission. At this time, if the TIE bit in SSER is set to 1, a TXI interrupt is generated.

When 1-frame data has been transferred with TDRE = 0, the SSTDR contents are transferred to SSTRSR to start the next frame transmission. When the 8th bit of transmit data has been transferred with TDRE = 1, the TEND bit in SSSR is set to 1 and the state is retained. At this time, if the TEIE bit is set to 1, a TEI interrupt is generated.

While the ORER bit in SSSR is set to 1, transmission is not performed. Check that the ORER bit is cleared to 0.

**Figure 19.13 Example of Transmission Operation  
(Clock Synchronous Communication Mode)**

**Figure 19.14 Flowchart Example of Transmission Operation  
(Clock Synchronous Communication Mode)**

### (3) Data Reception

Figure 19.15 shows an example of reception operation, and figure 19.16 shows a flowchart example of data reception. When receiving data, the SSU operates as shown below.

After setting the RE bit in SSER to 1, the SSU starts data reception.

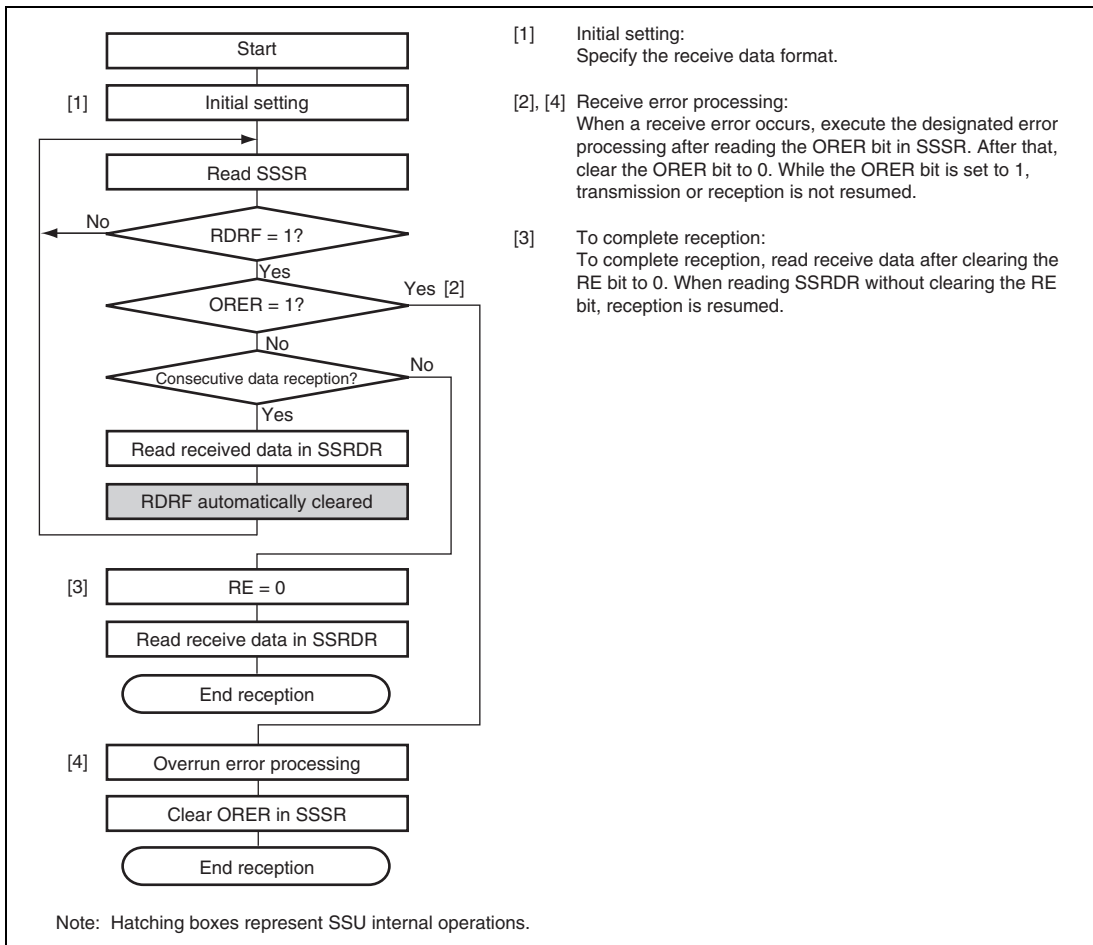

In master mode, the SSU outputs a transfer clock and receives data. In slave mode, when a transfer clock is input to the SSCK pin, the SSU receives data in synchronization with the transfer clock.

When 1-frame data has been received, the RDRF bit in SSSR is set to 1 and the receive data is stored in SSRDR. At this time, if the RIE bit is set to 1, an RXI interrupt is generated. The RDRF bit is automatically cleared to 0 by reading SSRDR.

When the RDRF bit has been set to 1 at the 8th rising edge of the transfer clock, the ORER bit in SSSR is set to 1. This indicates that an overrun error (OEI) has occurred. At this time, data reception is stopped. While the ORER bit in SSSR is set to 1, reception is not performed. To resume the reception, clear the ORER bit to 0.

**Figure 19.15 Example of Reception Operation  
(Clock Synchronous Communication Mode)**

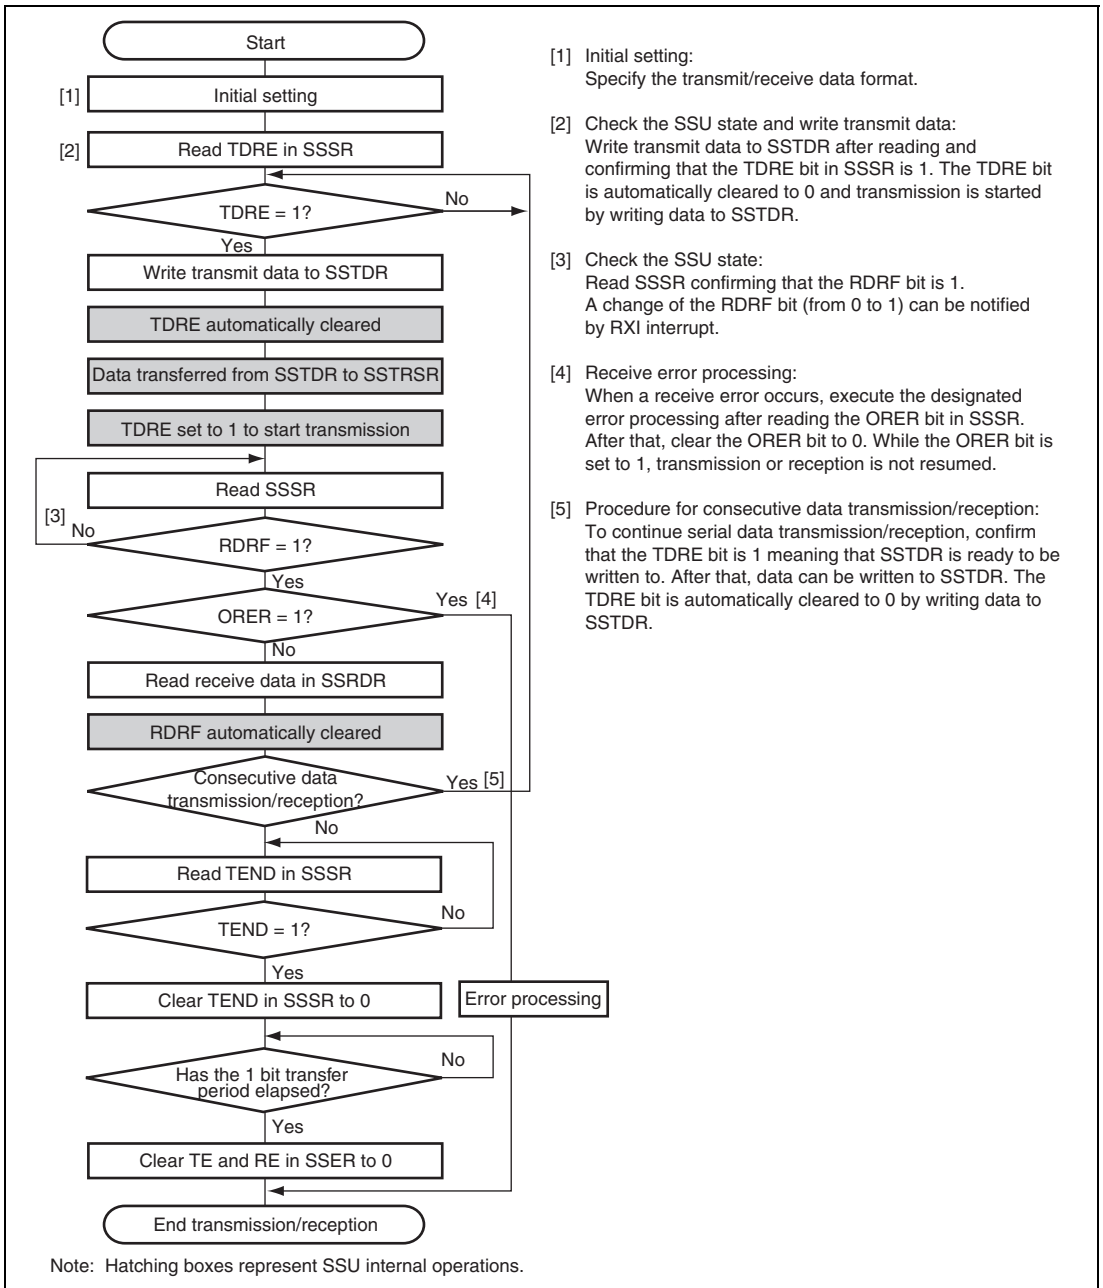

**Figure 19.16 Flowchart Example of Data Reception  
(Clock Synchronous Communication Mode)**

#### (4) Data Transmission/Reception

Figure 19.17 shows a flowchart example of simultaneous transmission/reception. The data transmission/reception is performed combining the data transmission and data reception as mentioned above. The data transmission/reception is started by writing transmit data to SSTDR with  $TE = RE = 1$ .

Before switching transmission mode ( $TE = 1$ ) or reception mode ( $RE = 1$ ) to transmission/reception mode ( $TE = RE = 1$ ), clear the TE and RE bits to 0. When starting the transfer, confirm that the TEND, RDRF, and ORER bits are cleared to 0 before setting the TE or RE bits to 1.

**Figure 19.17 Flowchart Example of Simultaneous Transmission/Reception  
(Clock Synchronous Communication Mode)**

## 19.5 Interrupt Requests

The SSU interrupt requests are an overrun error, a conflict error, a receive data register full, transmit data register empty, and a transmit end interrupts.

Since both an overrun error and a conflict error interrupts are allocated to the SSERI vector address, and both a transmit data register empty and a transmit end interrupts are allocated to the SSTXI vector address, the interrupt source should be decided by their flags. Table 19.7 lists the interrupt sources.

When an interrupt condition shown in table 19.7 is satisfied, an interrupt is requested. Clear the interrupt source by CPU or DMAC data transfer.

**Table 19.7 Interrupt Sources**

| Channel | Abbreviation | Interrupt Source             | Symbol | Interrupt Condition     | DMAC Activation |
|---------|--------------|------------------------------|--------|-------------------------|-----------------|
| 0       | SSERI0       | Overrun error                | OEI0   | (RIE = 1) • (ORER = 1)  | —               |
|         |              | Conflict error               | CEI0   | (CEIE = 1) • (CE = 1)   | —               |
|         | SSRXI0       | Receive data register full   | RXI0   | (RIE = 1) • (RDRF = 1)  | —               |
|         | SSTXI0       | Transmit data register empty | TXI0   | (TIE = 1) • (TDRE = 1)  | —               |
|         |              | Transmit end                 | TEI0   | (TEIE = 1) • (TEND = 1) | —               |

## 19.6 Usage Note

### 19.6.1 Module Stop Function Setting

SSU operation can be disabled or enabled using the module stop control register. The initial setting is for the SSU to be halted. Register access is enabled by clearing the module stop state. For details, see section 23, Power-Down Modes.

## Section 20 RAM

This LSI has an on-chip high-speed static RAM. The RAM is connected to the CPU by a 16-bit data bus, enabling one-state access by the CPU to both byte data and word data.

The on-chip RAM can be enabled or disabled by means of the RAME bit in the system control register (SYSCR). For details on the system control register (SYSCR), see section 3.2.2, System Control Register (SYSCR).

| Product Type |           | ROM Type             | RAM Capacity         | RAM Address          |

## Section 21 Flash Memory

The flash memory in this LSI can be accessed in three programming modes: user programming mode, boot mode, and programmer mode.

Table 21.1 gives an overview of the flash memory specifications (refer to section 1, Overview, for items that are not shown in table 21.1).

**Table 21.1 Overview of Flash Memory Specifications**

| Item                                 | Description   |
|--------------------------------------|---|
| Flash memory programming modes       | Three modes (user programming mode, boot mode, and programmer mode) |
| Erase block division                 | User ROM<br>Data flash  |
| Programming method                   | Word units  |
| Erase method                         | Block units   |
| Programming and erase control method | Programming and erasure are controlled by software commands         |
| Commands                             | Six commands  |
| Programming and erase count          | 1,000 times/10,000 times*1*2  |
| Data retention                       | Ten years   |

Notes: 1. The programming and erase count determine the number of times the erase operation can be performed in each block.

For example, if 1-word programming is done 2,048 times, each at a different address in a 4-Kbyte block and then the block is erased, this is counted as one erase count. If the allowed programming and erase count are 1,000 times, each block can be erased 1,000 times.

2. 10,000 times for the data flash and 1,000 times for other blocks.

**Table 21.2 Overview of Flash Memory Programming Modes**

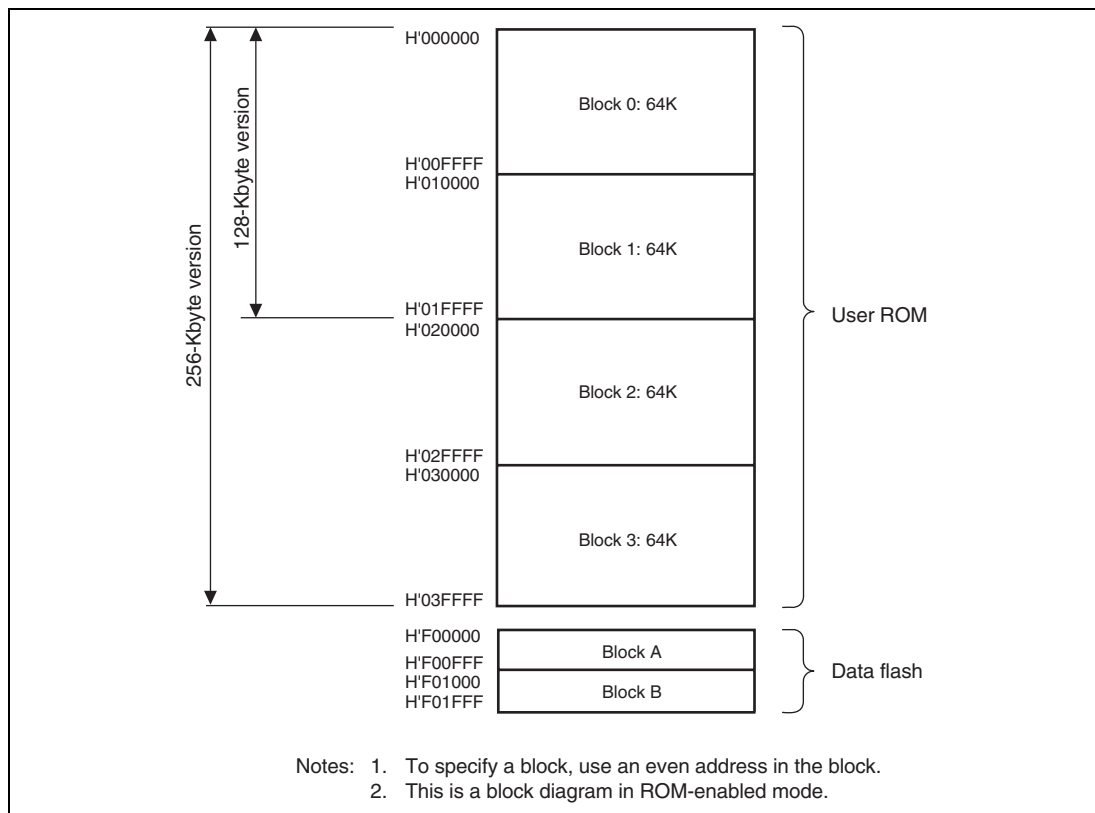

| Item                | On-board Programming Mode   |  | Off-board Mode  |
|---------------------|---|--|---|
|                     | User Programming Mode   | Boot Mode  | Programmer Mode   |
| Functional overview | The user ROM is programmed by the CPU through execution of software commands.<br>EW0 mode:<br>Programming can be done from outside of the flash memory. | The user ROM is programmed through the on-chip SCI interface.<br>Standard serial I/O mode 1:<br>Clock-synchronous serial I/O<br>Standard serial I/O mode 2:<br>Asynchronous serial I/O | The user ROM is programmed through a dedicated parallel programmer. |
| Programmable area   | User ROM, Data Flash  | User ROM, Data Flash   | User ROM, Data Flash  |
| Operating mode      | Single-chip mode, on-chip ROM enabled<br>expanded mode (EW0 mode)   | Boot mode  | Programmer mode   |
| ROM programmer      | —   | —  | Parallel programmer   |

## 21.1 Memory Map

This ROM is divided into the user ROM and the data flash.

Figure 21.1 shows a block diagram of the flash memory.

The user ROM and data flash are divided into multiple blocks. The user ROM can be programmed in user programming mode, boot mode, or programmer mode.

**Figure 21.1 Block Diagram of Flash Memory**

## 21.2 Register Descriptions

The flash memory has the following registers.

- Flash memory control register 1 (FLMCR1)
- Flash memory data block protect register (FLMDBPR)
- Flash memory status register (FLMSTR)

Note: When the FLSHE bit in SYSCR is 0, the read values are undefined and registers cannot be modified.

### 21.2.1 Flash Memory Control Register 1 (FLMCR1)

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | —        | 0             | —   | Reserved<br>The initial value should not be changed.   |
| 6   | CBIDB    | 1             | R/W | CPU Programming Mode Select<br>Setting this bit to 0 (CPU programming mode) enables command acceptance.<br>0: CPU programming mode enabled<br>1: CPU programming mode disabled   |
| 5   | —        | 0             | —   | Reserved<br>The initial value should not be changed.   |
| 4   | —        | 0             | —   | Reserved<br>The initial value should not be changed.   |
| 3   | —        | 0             | —   | Reserved<br>The initial value should not be changed.   |
| 2   | —        | 1             | —   | Reserved<br>The initial value should not be changed.   |
| 1   | —        | 0             | —   | Reserved<br>The initial value should not be changed.   |
| 0   | FMCM DEN | 0             | R/W | Flash Memory Software Command Enable<br>Setting this bit to 1 (CPU programming mode) enables command acceptance.<br>0: Flash memory software commands disabled<br>1: Flash memory software commands enabled<br>To set this bit to 1, be sure to write 0 and then write 1 in a row. |

Note: \* To set the FMCM DEN bit to 1, write 0 to FMCM DEN and then write 1 in a row.

### 21.2.2 Flash Memory Data Block Protect Register (FLMDBPR)

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | —        | 0             | —   | Reserved<br>The initial value should not be changed.  |
| 6   | —        | 0             | —   | Reserved<br>The initial value should not be changed.  |
| 5   | —        | 0             | —   | Reserved<br>The initial value should not be changed.  |
| 4   | —        | 0             | —   | Reserved<br>The initial value should not be changed.  |
| 3   | —        | 0             | —   | Reserved<br>The initial value should not be changed.  |
| 2   | —        | 0             | —   | Reserved<br>The initial value should not be changed.  |
| 1   | —        | 0             | —   | Reserved<br>The initial value should not be changed.  |
| 0   | FMDBPT0  | 0             | R/W | Data Flash E/W Protect*<br>0: Data flash E/W disabled<br>1: Data flash E/W enabled<br>To set this bit to 0, be sure to write 1 and then write 0 in a row. |

Note: \* This bit is set to 1 simultaneously when the FMCMDEN bit in FLMCR1 is set to 1. To set this bit to 1, be sure to write 0 and then write 1 in a row.

### 21.2.3 Flash Memory Status Register (FLMSTR)

| Bit | Bit Name | Initial Value | R/W | Description  |
|-----|----------|---------------|-----|--|
| 7   | —        | 0             | —   | Reserved<br>The initial value should not be changed.   |
| 6   | —        | 0             | —   | Reserved<br>The initial value should not be changed.   |
| 5   | FMERSF*  | 0             | R   | Erase or Blank Check Status Flag<br>0: Successfully completed<br>1: Ended with an error                |
| 4   | —        | 0             | —   | Reserved<br>The initial value should not be set.   |
| 3   | FMPRSF*  | 0             | R   | Program Status Flag<br>0: Successfully completed<br>1: Ended with an error                             |
| 2   | —        | 0             | —   | Reserved<br>The initial value should not be set.   |
| 1   | —        | 1             | —   | Reserved<br>The initial value should not be set.   |
| 0   | FMRDY    | 1             | R   | Flash Memory Ready/Busy Status<br>0: Busy (Interrupt processing or erasure is in progress)<br>1: Ready |

Note: \* The FMERSF and FMPRSF bits are cleared to 0 by a clear status command.

## 21.3 On-Board Programming Mode

When the mode pins (MD0, MD1, and MD2) are set to on-board programming mode and the reset start is executed, a transition is made to on-board programming mode in which the on-chip flash memory can be programmed/erased. On-board programming mode has two operating modes: SCI boot mode by P27 and P26 settings, and user programming mode.

Table 21.3 shows the pin setting for each operating mode.

**Table 21.3 On-Board Programming Mode Setting**

| Mode Setting          | EMLE | MD2   | MD1 | MD0 | P27 | P26 |
|-----------------------|------|---|-----|-----|-----|-----|
| SCI boot mode         | 0    | 0   | 1   | 1   | 0   | 0   |
| User programming mode |      | Single-chip mode, on-chip ROM enabled expanded mode |     |     | —   | —   |

### 21.3.1 User Programming Mode

In the user programming mode, the flash memory can be programmed by the CPU through execution of software commands. In this mode, the user ROM and data flash can be programmed without using a ROM programmer with the microcomputer mounted on a system board.

The programming and block erase commands should be executed only in each block area of the user ROM and data flash.

The user programming mode provides the erase/write 0 mode (EW0 mode). Table 21.4 gives an overview of the EW0 mode specifications.

**Table 21.4 EW0 Mode Specifications**

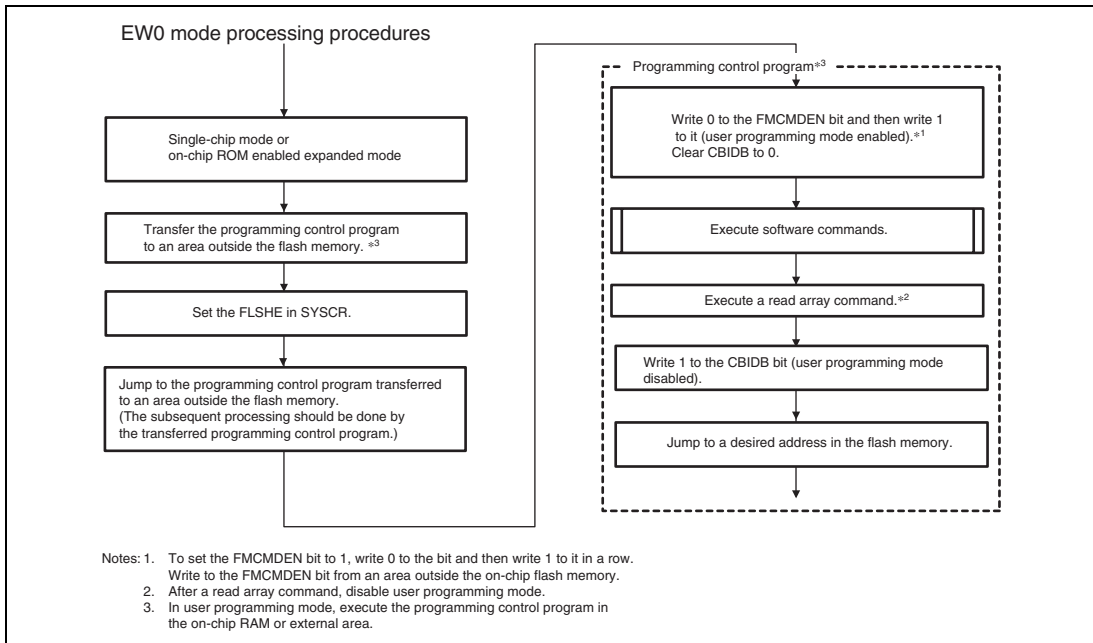

| Item   | Description   |
|--|---|
| Operating mode                                     | <ul style="list-style-type: none"> <li>• Single-chip mode</li> <li>• On-chip ROM enabled expanded mode</li> </ul>   |
| Area for storing the programming control program   | User ROM  |
| Area for executing the programming control program | The programming control program should be transferred to an area outside the flash memory (such as RAM) before execution* <sup>2</sup>  |
| Programmable area                                  | User ROM, data flash  |
| Limitations on software commands                   | None  |
| Mode after programming or erasure                  | Read status register mode   |
| CPU state during automatic programming or erasure  | Operating* <sup>1</sup>   |
| Flash memory status detection                      | <ul style="list-style-type: none"> <li>• Reading the FMPSRF and FMERSF bits in FLMSTR by a program.</li> <li>• Executing a read status register command to read the SR7, SR5, and SR4 bits in the status register.</li> </ul> |

Notes: 1. Make sure that no interrupt (except NMI) or DMA transfer is generated.  
 2. In the user programming mode, the programming control program should be executed in the on-chip RAM or an external area.

### 21.3.2 EW0 Mode

Setting the FMCMDEN bit in FLMCR1 to 1 shifts the flash memory into the user programming mode, in which commands can be accepted. Figure 21.2 shows how to set and clear the EW0 mode.

Programming and erasure are controlled through software commands. The flash memory state after programming or erasure can be checked through FLMSTR or the status register.

**Figure 21.2 Setting and Clearing EW0 Mode**

## 21.4 Software Commands

The following describes the software commands. A command or data should be read or written in 16-bit units at an even address in the user ROM or data flash area. When a command code is written, the lower eight bits (D7 to D0) are ignored.

**Table 21.5 List of Software Commands**

| Software Command      | First Bus Cycle |         |                  | Second Bus Cycle |         |                  | Third Bus Cycle |         |                  |
|-----------------------|-----------------|---------|------------------|------------------|---------|------------------|-----------------|---------|------------------|
|                       | Mode            | Address | Data (D15 to D0) | Mode             | Address | Data (D15 to D0) | Mode            | Address | Data (D15 to D0) |
| Read array            | Write           | x       | H'FFxx           |                  |         |                  |                 |         |                  |
| Read status register  | Write           | x       | H'70xx           | Read             | x       | SRD              |                 |         |                  |
| Clear status register | Write           | x       | H'50xx           |                  |         |                  |                 |         |                  |
| Program               | Write           | WA0     | H'41xx           | Write            | WA0     | WD0              | Write           | WA1     | WD1              |
| Block erase           | Write           | x       | H'20xx           | Write            | BA      | H'D0xx           |                 |         |                  |
| Block blank check     | Write           | x       | H'25xx           | Write            | BA      | H'D0xx           |                 |         |                  |

[Legend]

SRD: Status register data (D7 to D0)

WA0: Address to write the lower word (the address for the first bus cycle must be the same even address as that for the second bus cycle).

WA1: Address to write the upper word

WD0: Lower word of write data (16 bits)

WD1: Upper word of write data (16 bits)

BA: Lowest address of the block (note that this should be an even address).  
(i.e. H'0000 0000 for block 0, H'0001 0000 for block 1)

x: A desired even address in the user ROM, data flash, or user boot ROM.

xx: Lower eight bits of command code (ignored)

### 21.4.1 Read Array

This command reads the flash memory.

Write H'FFxx in the first bus cycle to shift the flash memory into the read array mode. Specify the target read address in the next bus cycle after setting the CBIDB bit in FLMCR1 to 1, and data is read from the address in 16-bit units.

As the flash memory stays in the read array mode until another command is issued, multiple addresses can be read in sequence.

### 21.4.2 Read Status Register

This command reads the status register.

Write H'70xx in the first bus cycle, and the status register can be read in the second bus cycle (refer to section 21.5, Status Register). Specify an even address in the program ROM, data flash, or user boot ROM to read the status register.

Do not issue this command in the EW1 mode.

### 21.4.3 Clear Status Register

This command clears the status register.

Write H'50xx in the first bus cycle, and the FMERSF and FMPSRF bits in FLMSTR are cleared to 0.

## 21.4.4 Program

This command writes data to the flash memory in 2-word units.

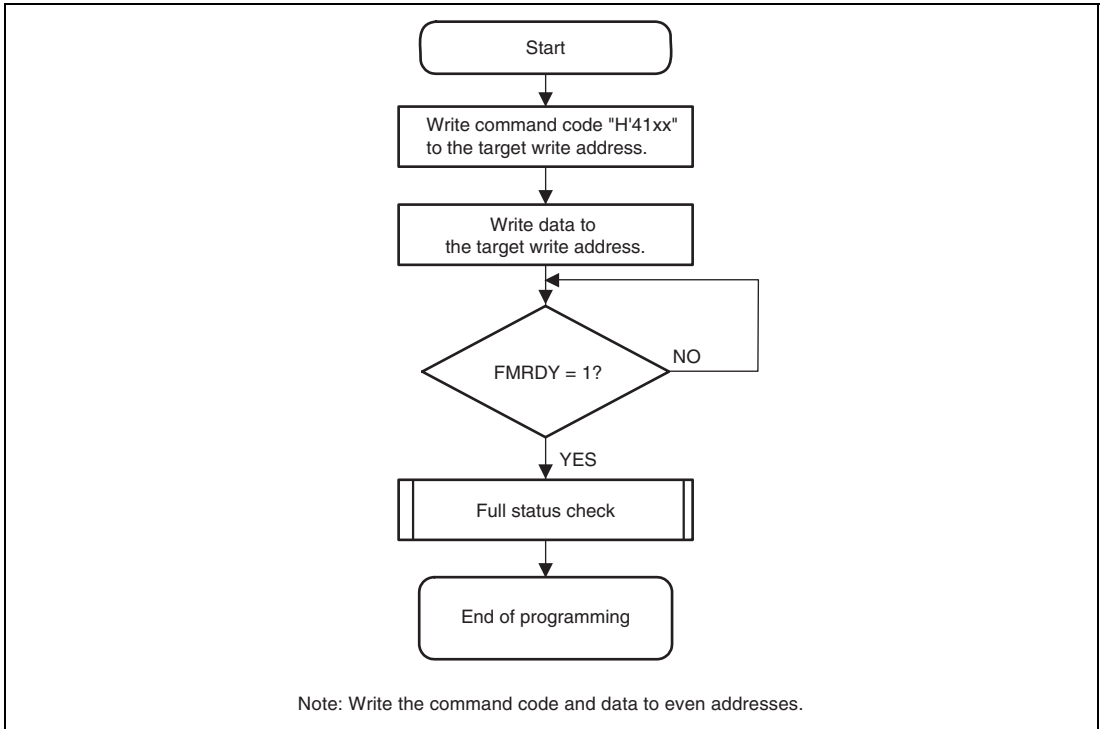

Write H'41xx in the first bus cycle and write data to the target address in the second and third bus cycles; the flash memory starts automatic writing (programming and verifying data). The address value specified in the first bus cycle should be the same even address as that specified in the second bus cycle.

Completion of automatic writing can be checked through the FMRDY bit in FLMSTR. The FMRDY bit is 0 (busy) during automatic writing and becomes 1 (ready) when writing is completed.

After automatic writing is completed, the result can be checked through the FMPSF bit in FMRSTR (refer to section 21.6, Full Status Check).

Once an address is programmed, no additional data can be written to the address. Figure 21.3 shows a flowchart of the program command processing.

In the EW0 mode, the read status register mode is entered as soon as automatic writing starts, and the status register can be read. The SR7 bit in the status register becomes 0 when automatic writing starts and returns to 1 when writing is completed. In this case, the flash memory stays in the read status register mode until a read array command is issued. After automatic writing is completed, the result of writing can be checked by reading the status register.

**Figure 21.3 Flowchart of Program Command Processing**

### 21.4.5 Block Erase

Write H'20xx in the first bus cycle and H'D0xx to the lowest address (an even address) of the target block in the second cycle; automatic erasure (erasing data and verifying the erased status) starts in the specified block.

Completion of automatic erasure can be checked through the FMRDY bit in FLMSTR.

The FMRDY bit is 0 (busy) during automatic erasure and becomes 1 (ready) when erasure is completed.

After automatic erasure is completed, the result can be checked through the FMERSF bit in FLMSTR (refer to section 21.6, Full Status Check).

Figure 21.4 shows a flowchart of the block erase command processing.

In the EW0 mode, the read status register mode is entered as soon as automatic erasure starts, and the status register can be read. The SR7 bit in the status register becomes 0 when automatic erasure starts and returns to 1 when erasure is completed. In this case, the flash memory stays in the read status register mode until a read array command is issued. If an erase error occurs, repeat a sequence of the clear status register command -> block erase command at least three times until no erase error occurs.

- Notes:1. Write the command code and data to even addresses.  
2. See figure 21.6.  
3. If an erase error occurs, repeat a sequence of the clear status register command -> block erase command at least three times until no erase error occurs.

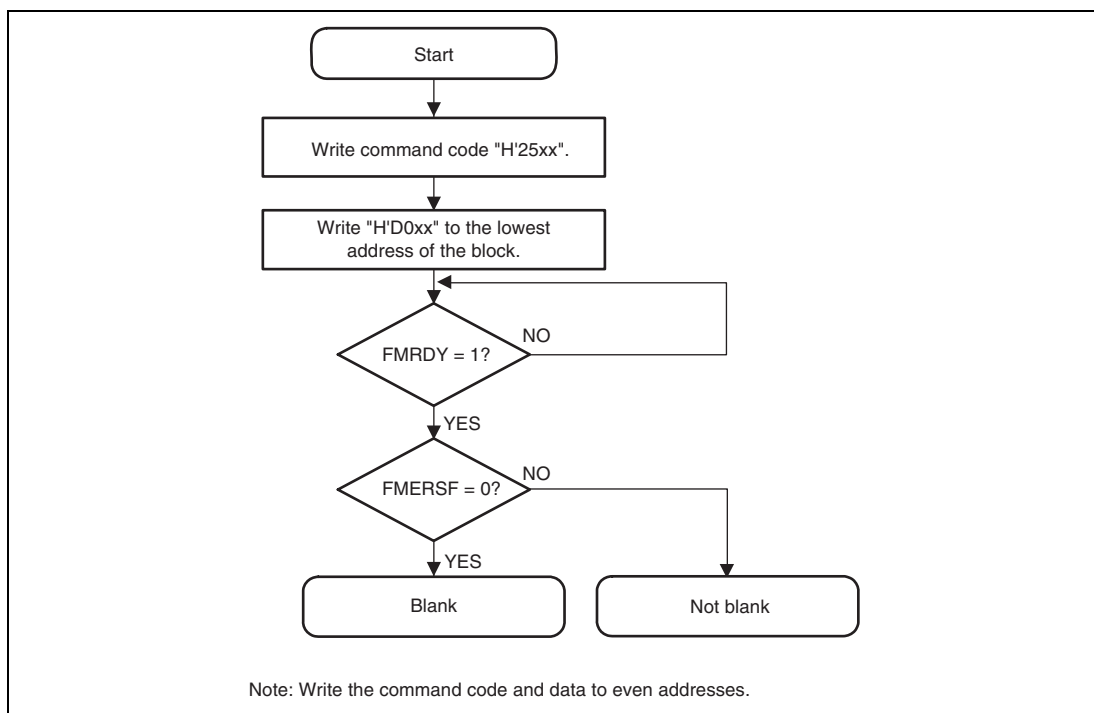

**Figure 21.4 Flowchart of Block Erase Command Processing**

## 21.4.6 Block Blank Check

This command checks if a block is blank (the erased state).

Write H'25xx in the first bus cycle and H'D0xx to the lowest address (an even address) of the target block in the second cycle; the check result will be stored in the FMERSF bit in FLMSTR. After the FMRDY bit in FLMSTR has become 1 (ready), read the FMERSF bit.

Figure 21.5 shows a flowchart of the block blank check command processing.

**Figure 21.5 Flowchart of Block Blank Check Command Processing**

## 21.5 Status Register

The status register indicates the state of flash memory operation and whether erasure or programming has ended successfully or with an error. The status register contents can be read through the FMRDY, FMPSRF, and FMERSF bits in FLMSTR.

Table 21.6 shows the status register.

In the EW0 mode, the status register can be read with the following timing.

- When a read status register command is issued and then an even address in the user ROM or data flash is read
- When a program command, a block erase command, or a block blank check command is issued and then an even address in the user ROM or data flash is read before a read array command is issued

**Table 21.6 Status Register**

| Bits in Status Register | Bits in FLMSTR | Status Name        | Status                 |                  | Value after Reset |
|-------------------------|----------------|--------------------|------------------------|------------------|-------------------|
|                         |                |                    | 0                      | 1                |                   |
| SR0 (D0)                | —              | Reserved           | —                      | —                | —                 |
| SR1 (D1)                | —              | Reserved           | —                      | —                | —                 |
| SR2 (D2)                | —              | Reserved           | —                      | —                | —                 |
| SR3 (D3)                | —              | Reserved           | —                      | —                | —                 |
| SR4 (D4)                | FMPSRF         | Programming status | Completed successfully | Ended with error | 0                 |
| SR5 (D5)                | FMERSF         | Erase status       | Completed successfully | Ended with error | 0                 |
| SR6 (D6)                | —              | Reserved           | —                      | —                | —                 |
| SR7 (D7)                | FMRDY          | Sequencer status   | Busy                   | Ready            | 1                 |

[Legend]

SR0 to SR7: Status register data

D0 to D7: Data bus from which the bit is read when a read status register command is issued.

Note: The FMERSF (SR5) and FMPSRF (SR4) bits are cleared to 0 by a clear status register command.

When the FMERSF (SR5) or FMPSRF (SR4) bit is 1, the program, block erase, and block blank check commands are not accepted.

### **21.5.1 Sequencer Status (FMRDY Bit)**

The sequencer status bit indicates the state of flash memory operation. Its value is 0 during execution of a program, block erase, or block blank check and 1 in other cases.

### **21.5.2 Erase Status (FMERSF Bit)**

Refer to section 21.6, Full Status Check.

### **21.5.3 Programming Status (FMPRSF Bit)**

Refer to section 21.6, Full Status Check.

## 21.6 Full Status Check

When an error occurs, the FMERSF or FMPRSF bit in FLMSTR becomes 1 to indicate occurrence of the error. Read these status bits (full status check) to check the operation results.

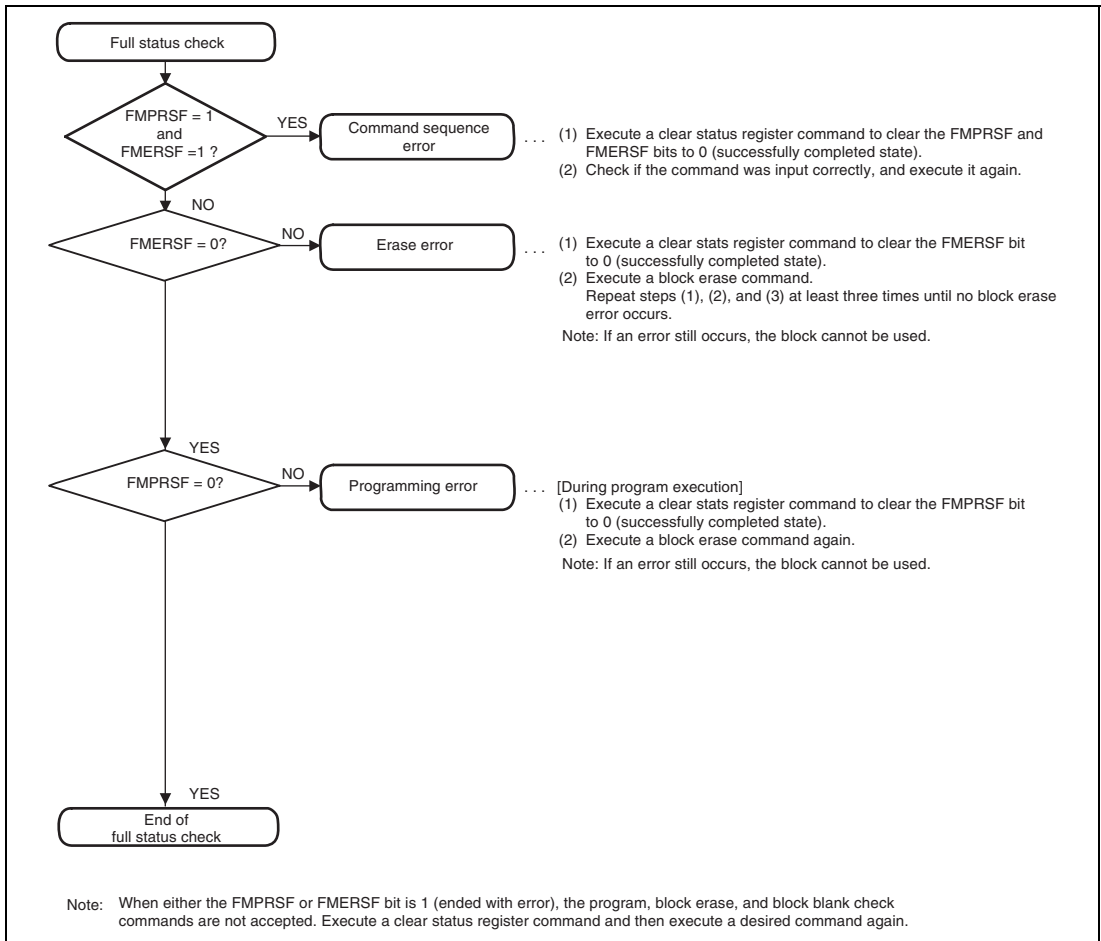

Table 21.7 shows the errors and FLMSTR status and figure 21.6 shows a flowchart of full status check processing and corrective actions for each error.

**Table 21.7 Errors and Register Status**

| State of FLMSTR<br>(Status Register) |                     |                        |  |
|--------------------------------------|---------------------|------------------------|--|
| FMERSF Bit<br>(SR5)                  | FMPRSF Bit<br>(SR4) | Error                  | Error Conditions   |
| 1                                    | 1                   | Command sequence error | <ul style="list-style-type: none"> <li>When a command is not issued correctly</li> <li>When an invalid value (a value other than H'D0xx or H'FFxx) is written in the second bus cycle of a block erase command*</li> </ul> |
| 1                                    | 0                   | Erase error            | <ul style="list-style-type: none"> <li>When a block erase command is issued but the block is not erased correctly</li> <li>When a block blank check command is issued and the checked block is not blank</li> </ul>        |
| 0                                    | 1                   | Programming error      | <ul style="list-style-type: none"> <li>When a program command is issued but automatic writing is not done correctly</li> </ul>   |

Note: \* When H'FFxx is written in the second bus cycle of this command, the flash memory enters the read array mode and the command code written in the first bus cycle is ignored.

**Figure 21.6 Flowchart of Full Status Check Processing and Corrective Actions for Each Error**

## 21.7 Notes on User Programming Mode

### 21.7.1 Prohibited Interrupts (EW0 Mode)

The NMI and watchdog timer interrupts can be used because FLMCR1 is forcibly initialized when an interrupt is generated; specify the destination address of each interrupt routine in the fixed vector table. Flash memory programming is terminated when an NMI interrupt or a watchdog timer interrupt occurs. In this case, reexecute the programming program after the interrupt routine is completed.

### 21.7.2 Access Method

To set the FMCMDEN bit to 1, be sure to write 0 to the bit and then write 1 in a row. Make sure that no interrupt, EXDMAC transfer, DTC transfer, or DMA transfer is generated between writing 0 and 1.

### 21.7.3 Programming (EW0 Mode)

If the power-supply voltage falls during programming of the block that stores the programming control program, the programming control program cannot be correctly modified and the flash memory may not be programmed after that. In this case, use the boot mode or programmer mode instead.

### 21.7.4 Writing Commands or Data

The address to write a command code or data should be H'0, H'4, H'8, or H'C.

### 21.7.5 Software Standby Mode

Before entering the stop mode, set the FMCMDEN bit to 0 (CPU programming mode disabled), disable the DMA transfer, and then make a transition to the software standby mode.

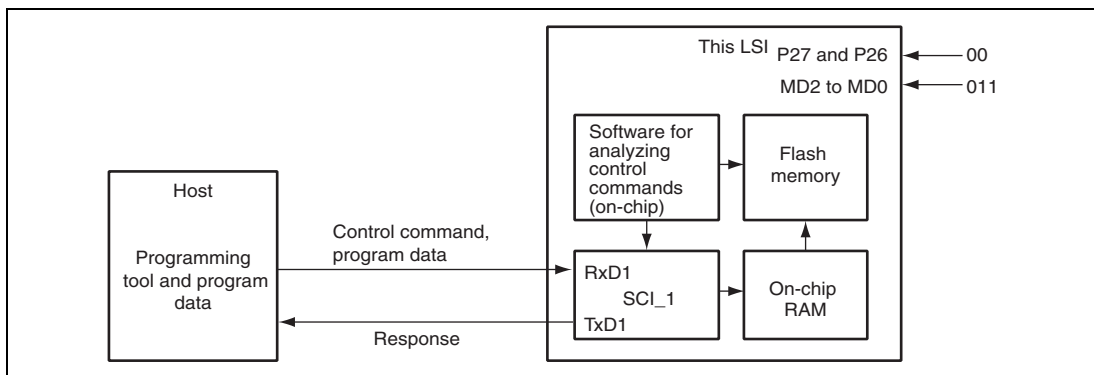

## 21.8 Boot Mode

Setting the mode pins to mode 3 and resetting the hardware shifts the flash memory into boot mode. In this mode, the embedded standard program is executed.

## 21.9 SCI Boot Mode

SCI boot mode executes programming/erasing of the user ROM by means of the control command and program data transmitted from the externally connected host via the on-chip SCI\_1.

In SCI boot mode, the tool for transmitting the control command and program data, and the program data must be prepared in the host. The serial communication mode is set to asynchronous mode. The system configuration in SCI boot mode is shown in figure 21.7. Interrupts are ignored in SCI boot mode. Configure the user system so that interrupts do not occur.

**Figure 21.7 System Configuration in SCI Boot Mode**

## 21.10 Serial Communication Interface Specification for Boot Mode

Initiating boot mode enables the boot program to communicate with the host by using the on-chip SCI\_I. The serial communication interface specification is shown below.

### (1) Status

The boot program has three states.

#### 1. Bit-Rate-Adjustment State

In this state, the boot program adjusts the bit rate to communicate with the host. Initiating boot mode enables starting of the boot program and entry to the bit-rate-adjustment state. The program receives the command from the host to adjust the bit rate. After adjusting the bit rate, the program enters the inquiry/selection state.

#### 2. Inquiry/Selection State

In this state, the boot program responds to inquiry commands from the host. The device name, clock mode, and bit rate are selected. After selection of these settings, the program is made to enter the programming/erasing state by the command for a transition to the programming/erasing state. The program transfers the libraries required for erasure to the RAM and erases the user ROMs before the transition.

#### 3. Programming/erasing state

Programming and erasure by the boot program take place in this state. The boot program is made to transfer the programming/erasing programs to the RAM by commands from the host. Sum checks and blank checks are executed by sending these commands from the host.

These boot program states are shown in figure 21.8.

**Figure 21.8 Boot Program States**

## (2) Bit-Rate-Adjustment State

The bit rate is calculated by measuring the period of transfer of a low-level byte (H'00) from the host. The bit rate can be changed by the command for a new bit rate selection. After the bit rate has been adjusted, the boot program enters the inquiry and selection state. The bit-rate-adjustment sequence is shown in figure 21.9.

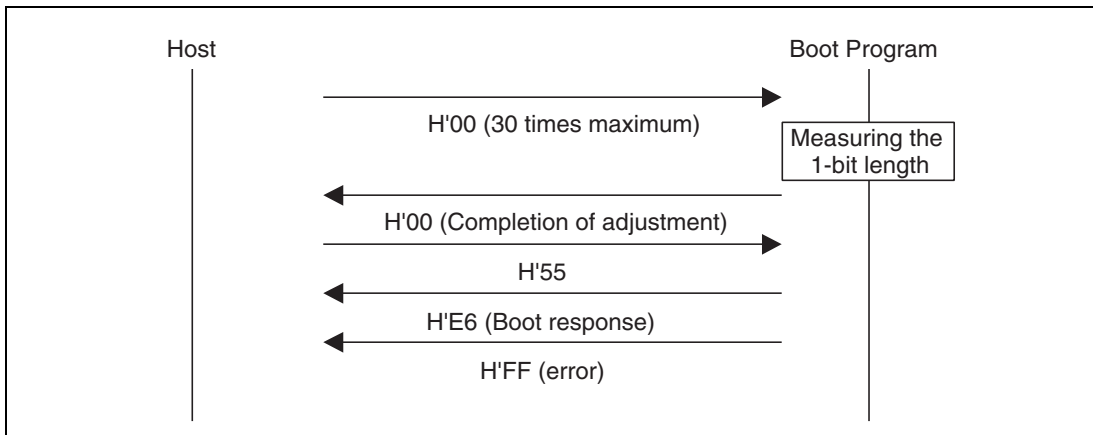

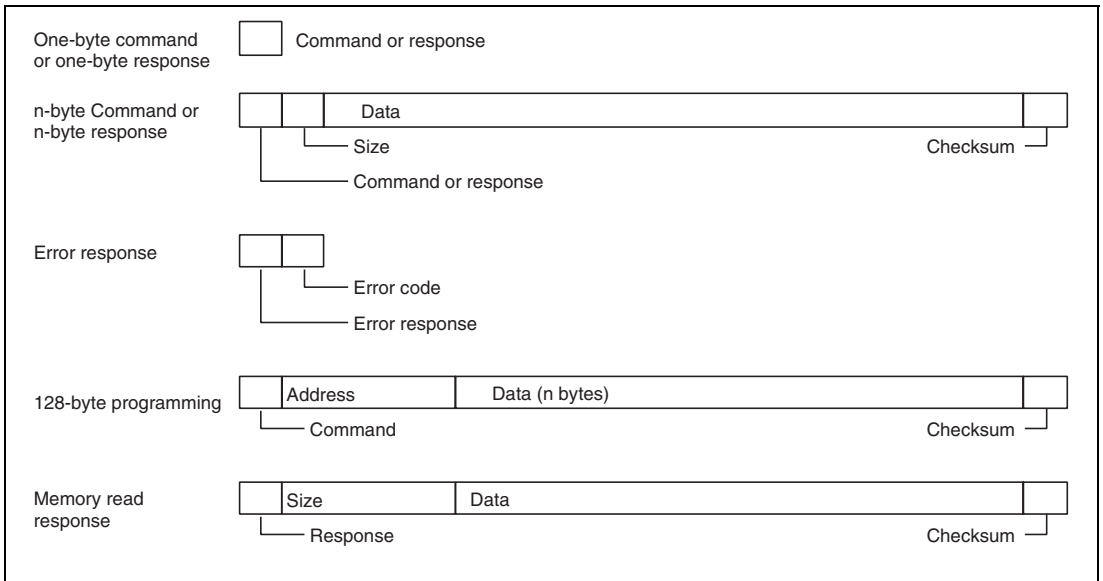

Figure 21.9 Bit-Rate-Adjustment Sequence

### (3) Communications Protocol

After adjustment of the bit rate, the protocol for communications between the host and the boot program is as shown below.

1. One-byte commands and one-byte responses  
These commands and responses are comprised of a single byte. These are consists of the inquiries and the ACK for successful completion.
2. n-byte commands or n-byte responses  
These commands and responses are comprised of n bytes of data. These are selections and responses to inquiries.  
The amount of programming data is not included under this heading because it is determined in another command.
3. Error response  
The error response is a response to inquiries. It consists of an error response and an error code and comes two bytes.
4. Programming of 128 bytes  
The size is not specified in commands. The size of n is indicated in response to the programming unit inquiry.
5. Memory read response  
This response consists of 4 bytes of data.

**Figure 21.10 Communication Protocol Format**

- **Command (1 byte):** Commands including inquiries, selection, programming, erasing, and checking
- **Response (1 byte):** Response to an inquiry
- **Size (1 byte):** The amount of data for transmission excluding the command, data, and checksum
- **Data (n bytes):** Detailed data of a command or response
- **Checksum (1 byte):** The checksum is calculated so that the total of all values from the command byte to the SUM byte becomes H'00.
- **Error response (1 byte):** Error response to a command
- **Error code (1 byte):** Type of the error
- **Address (4 bytes):** Address for programming
- **Data (n bytes):** Data to be programmed (the size is indicated in the response to the programming unit inquiry.)
- **Size (4 bytes):** 4-byte response to a memory read

#### (4) Inquiry/Selection State

The boot program returns information from the flash memory in response to the host's inquiry commands and sets the device code, clock mode, and bit rate in response to the host's selection command.

Inquiry and selection commands are listed below.

**Table 21.8 Inquiry and Selection Commands**

| Command | Command Name                            | Description  |
|---------|---|--|
| H'20    | Supported device Inquiry                | Inquiry regarding device codes and product name  |
| H'10    | Device selection                        | Selection of device code   |
| H'21    | Clock mode inquiry                      | Inquiry regarding numbers of clock modes and values of each mode   |
| H'11    | Clock mode selection                    | Indication of the selected clock mode  |
| H'22    | Multiplication ratio inquiry            | Inquiry regarding the number of frequency-multiplied clock types, the number of multiplication ratios, and the values of each multiple |
| H'23    | Operating clock frequency inquiry       | Inquiry regarding the maximum and minimum values of the main clock and peripheral clocks   |
| H'25    | User ROM information inquiry            | Inquiry regarding the number of user ROMs and the start and last addresses of each ROM   |
| H'26    | Erased block information inquiry        | Inquiry regarding the number of blocks and the start and last addresses of each block  |
| H'27    | Programming unit inquiry                | Inquiry regarding the unit of programming data   |
| H'3F    | New bit rate selection                  | Selection of new bit rate  |
| H'40    | Transition to programming/erasing state | Erasing of user ROM and entry to programming/erasing state   |
| H'4F    | Boot program status inquiry             | Inquiry regarding the operated status of the boot program  |

The selection commands, which are device selection (H'10), clock mode selection (H'11), and new bit rate selection (H'3F), should be sent from the host in that order. These commands will certainly be needed. When two or more selection commands are sent at once, the last command will be valid.

All of these commands, except for the boot program status inquiry command (H'4F), will be valid until the boot program receives the programming/erasing transition command (H'40). The host can choose the needed commands out of the commands and inquiries listed above. The boot program status inquiry command (H'4F) is valid even after the boot program has received the programming/erasing transition command (H'40).

### (a) Supported Device Inquiry

The boot program will return the device codes of supported devices and the product name in response to the supported device inquiry.

Command 

|      |
|------|
| H'20 |
|------|

- Command, H'20, (1 byte): Inquiry regarding supported devices

|          |                      |             |                   |              |
|----------|----------------------|-------------|-------------------|--------------|
| Response | H'30                 | Size        | Number of devices |              |
|          | Number of characters | Device code |                   | Product name |
|          | ...                  |             |                   |              |
|          | SUM                  |             |                   |              |

- Response, H'30, (1 byte): Response to the supported device inquiry
- Size (1 byte): Number of bytes to be transmitted, excluding the command, size, and checksum, that is, the amount of data contributes by the number of devices, characters, device codes and product names
- Number of devices (1 byte): The number of device types supported by the boot program
- Number of characters (1 byte): The number of characters in the device codes and boot program's name
- Device code (4 bytes): ASCII code of the supporting product
- Product name (n bytes): Type name of the boot program in ASCII-coded characters
- SUM (1 byte): Checksum

The checksum is calculated so that the total of all values from the command byte to the SUM byte becomes H'00.

**(b) Device Selection**

The boot program will set the supported device to the specified device code. The program will return the selected device code in response to the inquiry after this setting has been made.

|         |      |      |             |     |
|---------|------|------|-------------|-----|
| Command | H'10 | Size | Device code | SUM |
|---------|------|------|-------------|-----|

- Command, H'10, (1 byte): Device selection
- Size (1 byte): Amount of device-code data  
This is fixed at 2.
- Device code (4 bytes): Device code (ASCII code) returned in response to the supported device inquiry
- SUM (1 byte): Checksum

|          |      |
|----------|------|
| Response | H'06 |
|----------|------|

- Response, H'06, (1 byte): Response to the device selection command  
ACK will be returned when the device code matches.

|                |      |       |
|----------------|------|-------|
| Error response | H'90 | ERROR |
|----------------|------|-------|

- Error response, H'90, (1 byte): Error response to the device selection command  
ERROR: (1 byte): Error code  
H'11: Sum check error  
H'21: Device code mismatch error, that is, the device code does not match

**(c) Clock Mode Inquiry**

The boot program will return the supported clock modes in response to the clock mode inquiry.

|         |      |
|---------|------|
| Command | H'21 |
|---------|------|

- Command, H'21, (1 byte): Inquiry regarding clock mode

|          |      |      |      |     |     |
|----------|------|------|------|-----|-----|
| Response | H'31 | Size | Mode | ... | SUM |
|----------|------|------|------|-----|-----|

- Response, H'31, (1 byte): Response to the clock-mode inquiry
- Size (1 byte): Amount of data that represents modes
- Mode (1 byte): Values of the supported clock modes (i.e. H'01 means clock mode 1.)
- SUM (1 byte): Checksum

### (d) Clock Mode Selection

The boot program will set the specified clock mode. The program will return the selected clock-mode information after this setting has been made.

The clock-mode selection command should be sent after the device-selection commands.

|         |      |      |      |     |
|---------|------|------|------|-----|
| Command | H'11 | Size | Mode | SUM |
|---------|------|------|------|-----|

- Command, H'11, (1 byte): Selection of clock mode
- Size (1 byte): Amount of data that represents the modes  
This is fixed at 1.
- Mode (1 byte): A clock mode returned in reply to the supported clock mode inquiry.
- SUM (1 byte): Checksum

|          |      |
|----------|------|
| Response | H'06 |
|----------|------|

- Response, H'06, (1 byte): Response to the clock mode selection command  
ACK will be returned when the clock mode matches.

|                |      |       |
|----------------|------|-------|
| Error response | H'91 | ERROR |
|----------------|------|-------|

- Error response, H'91, (1 byte): Error response to the clock mode selection command
- ERROR, (1 byte): Error code
  - H'11: Sum check error
  - H'22: Clock mode mismatch error, that is, the clock mode does not match.

Even if the clock mode numbers are H'00 and H'01 by a clock mode inquiry, the clock mode must be selected using these respective values.

**(e) Multiplication Ratio Inquiry**

The boot program will return the supported multiplication and division ratios.

Command 

|      |
|------|
| H'22 |
|------|

- Command, H'22, (1 byte): Inquiry regarding multiplication ratio

|          |                                 |                      |                 |  |  |  |  |  |
|----------|---------------------------------|----------------------|-----------------|--|--|--|--|--|
| Response | H'32                            | Size                 | Number of types |  |  |  |  |  |
|          | Number of multiplication ratios | Multiplication ratio | ...             |  |  |  |  |  |
|          | ...                             |                      |                 |  |  |  |  |  |
|          | SUM                             |                      |                 |  |  |  |  |  |

- Response, H'32, (1 byte): Response to the multiplication ratio inquiry
- Size (1 byte): The amount of data that represents the number of clock types and multiplication ratios and the multiplication ratios
- Number of types (1 byte): The number of supported multiplied clock types (e.g. when there are two multiplied clock types, which are the main and peripheral clocks, the number of types will be H'02.)
- Number of multiplication ratios (1 byte): The number of multiplication ratios for each type (e.g. the number of multiplication ratios to which the main clock can be set and the peripheral clock can be set.)
- Multiplication ratio (1 byte)
 

Multiplication ratio: The value of the multiplication ratio (e.g. when the clock-frequency multiplier is four, the value of multiplication ratio will be H'04.)

Division ratio: The number of multiplication ratios returned is the same as the number of multiplication ratios and as many groups of data are returned as there are types.
- SUM (1 byte): Checksum

**(f) Operating Clock Frequency Inquiry**

The boot program will return the number of operating clock frequencies, and the maximum and minimum values.

Command 

|      |
|------|
| H'23 |
|------|

- Command, H'23, (1 byte): Inquiry regarding operating clock frequencies

|          |  |      |  |
|----------|--|------|--|
| Response | H'33                                       | Size | Number of operating clock frequencies      |
|          | Minimum value of operating clock frequency |      | Maximum value of operating clock frequency |
|          | ...  |      |  |
|          | SUM  |      |  |

- Response, H'33, (1 byte): Response to operating clock frequency inquiry
- Size (1 byte): The number of bytes that represents the minimum values, maximum values, and the number of frequencies.
- Number of operating clock frequencies (1 byte): The number of supported operating clock frequency types (e.g. when there are two operating clock frequency types, which are the main and peripheral clocks, the number of types will be H'02.)
- Minimum value of operating clock frequency (2 bytes): The minimum value of the multiplied or divided clock frequency.  
The minimum and maximum values represent the values in MHz, valid to the hundredths place of MHz, and multiplied by 100 (e.g. when the value is 64 MHz, it will be 6400 and H'1900).
- Maximum value (2 bytes): Maximum value of the multiplied or divided clock frequencies.  
There are as many pairs of minimum and maximum values as there are operating clock frequency.
- SUM (1 byte): Checksum

**(g) User ROM Information Inquiry**

The boot program will return the number of user ROMs and their addresses.

Command 

|      |
|------|
| H'25 |
|------|

- Command, H'25, (1 byte): Inquiry regarding user ROM information

|          |                    |      |                 |                   |
|----------|--------------------|------|-----------------|-------------------|
| Response | H'35               | Size | Number of areas |                   |
|          | Area-start address |      |                 | Area-last address |
|          | ...                |      |                 |                   |
|          | SUM                |      |                 |                   |

- Response, H'35, (1 byte): Response to the user ROM information inquiry
- Size (1 byte): The number of bytes that represents the number of areas, area-start address, and area-last address
- Number of areas (1 byte): The number of consecutive user ROM areas  
When the user ROM areas are consecutive, the number of areas returned is H'01.
- Area-start address (4 bytes): Start address of the area
- Area-last address (4 byte): Last address of the area  
There are as many groups of data representing the start and last addresses as there are areas.
- SUM (1 byte): Checksum

**(h) Erased Block Information Inquiry**

The boot program will return the number of erased blocks and their addresses.

Command 

|      |
|------|
| H'26 |
|------|

- Command, H'26, (1 byte): Inquiry regarding erased block information

|          |                     |      |                  |                    |
|----------|---------------------|------|------------------|--------------------|
| Response | H'36                | Size | Number of blocks |                    |
|          | Block-start address |      |                  | Block-last address |
|          | ...                 |      |                  |                    |
|          | SUM                 |      |                  |                    |

- Response, H'36, (1 byte): Response to the number of erased blocks and addresses
- Size (2 bytes): The number of bytes that represents the number of blocks, block-start addresses, and block-last addresses.
- Number of blocks (1 byte): The number of erased blocks
- Block-start address (4 bytes): Start address of a block
- Block-last Address (4 bytes): Last address of a block  
There are as many groups of data representing the start and last addresses as there are blocks.
- SUM (1 byte): Checksum

**(i) Programming Unit Inquiry**

The boot program will return the programming unit used to program data.

Command 

|      |
|------|
| H'27 |
|------|

- Command, H'27, (1 byte): Inquiry regarding programming unit

|          |      |      |                  |     |
|----------|------|------|------------------|-----|
| Response | H'37 | Size | Programming unit | SUM |
|----------|------|------|------------------|-----|

- Response, H'37, (1 byte): Response to programming unit inquiry
- Size (1 byte): The number of bytes that indicate the programming unit, which is fixed to 2
- Programming unit (2 bytes): A unit for programming  
This is the unit for reception of programming data.
- SUM (1 byte): Checksum

**(j) New Bit-Rate Selection**

The boot program will set a new bit rate and return the new bit rate.

This selection should be sent after sending the clock mode selection command.

| Command | H'3F                            | Size                   | Bit rate               | Input frequency |
|---------|---------------------------------|------------------------|------------------------|-----------------|
|         | Number of multiplication ratios | Multiplication ratio 1 | Multiplication ratio 2 |                 |
|         | SUM                             |                        |                        |                 |

- Command, H'3F, (1 byte): Selection of new bit rate
- Size (1 byte): The number of bytes that represents the bit rate, input frequency, number of multiplication ratios, and multiplication ratio
- Bit rate (2 bytes): New bit rate  
One hundredth of the value (e.g. when the value is 19,200 bps, the bit rate is H'00C0, which is 192.)
- Input frequency (2 bytes): Frequency of the clock input to the boot program  
This is valid to the hundredths place and represents the value in MHz multiplied by 100 (e.g. when the value is 64 MHz, the input frequency is H'1900 (= 6400)).
- Number of multiplication ratios (1 byte): The number of multiplication ratios to which the device can be set.
- Multiplication ratio 1 (1 byte): The value of multiplication or division ratios for the main operating frequency  
Multiplication ratio (1 byte): The value of the multiplication ratio (e.g. when the clock frequency is multiplied by four, the multiplication ratio will be H'04.)  
Division ratio: The inverse of the division ratio, as a negative number (e.g. when the clock frequency is divided by two, the value of division ratio will be H'FE. H'FE = [-2])
- Multiplication ratio 2 (1 byte): The value of multiplication or division ratios for the peripheral frequency  
Multiplication ratio (1 byte): The value of the multiplication ratio (e.g. when the clock frequency is multiplied by four, the multiplication ratio will be H'04.)  
(Division ratio: The inverse of the division ratio, as a negative number (e.g. when the clock is divided by two, the value of division ratio will be H'FE. H'FE = [-2])

- SUM (1 byte): Checksum

Response 

|      |
|------|
| H'06 |
|------|

- Response, H'06, (1 byte): Response to selection of a new bit rate  
When it is possible to set the bit rate, the response will be ACK.

Error response 

|      |       |
|------|-------|
| H'BF | ERROR |
|------|-------|

- Error response, H'BF, (1 byte): Error response to selection of new bit rate
- ERROR: (1 byte): Error code
  - H'11: Sum check error
  - H'24: Bit-rate selection disable error  
The rate is not available.
  - H'25: Input frequency error  
This input frequency is not within the specified range.
  - H'26: Multiplication-ratio error  
The ratio does not match an available ratio.
  - H'27: Operating frequency error  
The frequency is not within the specified range.

## (5) Received Data Check

The methods for checking of received data are listed below.

### 1. Input frequency

The received value of the input frequency is checked to ensure that it is within the range of minimum to maximum frequencies which matches the clock modes of the specified device. When the value is out of this range, an input-frequency error is generated.

### 2. Multiplication ratio

The received value of the multiplication ratio or division ratio is checked to ensure that it matches a multiplication or division ratio for the clock modes of the specified device. When the value is out of this range, an input-frequency error is generated.

### 3. Operating frequency error

The operating frequency is calculated from the received value of the input frequency and the multiplication or division ratio. The input frequency is input to the LSI and the LSI is operated at the operating frequency. The expression is given below.

Operating frequency = Input frequency × Multiplication ratio, or

Operating frequency = Input frequency ÷ Division ratio

The calculated operating frequency should be checked to ensure that it is within the range of minimum to maximum frequencies which are available with the clock modes of the specified device. When it is out of this range, an operating frequency error is generated.

### 4. Bit rate

To facilitate error checking, the value (n) of clock select (CKS) in the serial mode register (SMR), and the value (N) in the bit rate register (BRR), which are found from the peripheral operating clock frequency ( $\phi$ ) and bit rate (B), are used to calculate the error rate to ensure that it is less than 4%. If the error is 4% or more, a bit rate error is generated. The error is calculated using the following expression:

$$\text{Error (\%)} = \left\{ \left[ \frac{\phi \times 10^6}{(N + 1) \times B \times 64 \times 2^{(2 \times n - 1)}} \right] - 1 \right\} \times 100$$

When the new bit rate is selectable, the rate will be set in the register after sending ACK in response. The host will send an ACK with the new bit rate for confirmation and the boot program will response with that rate.

Confirmation H'06

- Confirmation, H'06, (1 byte): Confirmation of a new bit rate

Response H'06

- Response, H'06, (1 byte): Response to confirmation of a new bit rate

The sequence of new bit-rate selection is shown in figure 21.11.

**Figure 21.11 New Bit-Rate Selection Sequence**

## (6) Transition to Programming/Erasing State

The boot program will transfer the erasing program, and erase the user ROMs. On completion of this erasure, ACK will be returned and the programming/erasing state will be entered.

The host should select the device code, clock mode, and new bit rate with device selection, clock-mode selection, and new bit-rate selection commands, and then send the command for the transition to programming/erasing state. These procedures should be carried out before sending of the programming selection command or program data.

Command 

|      |
|------|
| H'40 |
|------|

- Command, H'40, (1 byte): Transition to programming/erasing state

Response 

|      |
|------|
| H'06 |
|------|

- Response, H'06, (1 byte): Response to transition to programming/erasing state

The boot program will send ACK when the user ROM has been erased by the transferred erasing program.

Error response 

|      |      |
|------|------|
| H'C0 | H'51 |
|------|------|

- Error code, H'51, (1 byte): Erasure error  
An error occurred and erasure was not completed.

## (7) Command Error

A command error will occur when a command is undefined, the order of commands is incorrect, or a command is unacceptable. Issuing a clock-mode selection command before a device selection or an inquiry command after the transition to programming/erasing state command, are examples.

Error response 

|      |      |
|------|------|
| H'80 | H'xx |
|------|------|

- Error response, H'80, (1 byte): Command error
- Command, H'xx, (1 byte): Received command

## (8) Command Order

The order for commands in the inquiry/selection state is shown below.

1. A supported device inquiry (H'20) should be made to inquire about the supported devices.
2. The device should be selected from among those described by the returned information and set with a device-selection (H'10) command.
3. A clock-mode inquiry (H'21) should be made to inquire about the supported clock modes.
4. The clock mode should be selected from among those described by the returned information and set.
5. After selection of the device and clock mode, inquiries for other required information should be made, such as the multiplication-ratio inquiry (H'22) or operating frequency inquiry (H'23), which are needed for a new bit-rate selection.
6. A new bit rate should be selected with the new bit-rate selection (H'3F) command, according to the returned information on multiplication ratios and operating frequencies.
7. After selection of the device and clock mode, the information of the user ROM should be made to inquire about the user ROMs information inquiry (H'25), erased block information inquiry (H'26), and programming unit inquiry (H'27).
8. After making inquiries and selecting a new bit rate, issue the transition to programming/erasing state command (H'40). The boot program will then enter the programming/erasing state.

## (9) Programming/Erasing State

A programming selection command makes the boot program select the programming method, an 128-byte programming command makes it program the memory with data, and an erasing selection command and block erasing command make it erase the block. The programming/erasing commands are listed below.

**Table 21.9 Programming/Erasing Commands**

| Command | Command Name                       | Description                                    |
|---------|------------------------------------|--|
| H'43    | User-program programming selection | Transfers the user ROM programming program     |
| H'50    | 128-byte programming               | Programs 128 bytes of data                     |
| H'48    | Erasure selection                  | Transfers the erasing program                  |
| H'58    | Block erasure                      | Erases a block of data                         |
| H'52    | Memory read                        | Reads the contents of memory                   |
| H'4B    | User ROM sum check                 | Executes sum checking of the user ROM area     |
| H'61    | Data flash sum check               | Executes sum checking of the data flash area   |
| H'4D    | User ROM blank check               | Executes blank checking of the user ROM area   |
| H'62    | Data flash blank check             | Executes blank checking of the data flash area |
| H'4F    | Boot program status inquiry        | Inquires into the boot program's status        |

- Programming

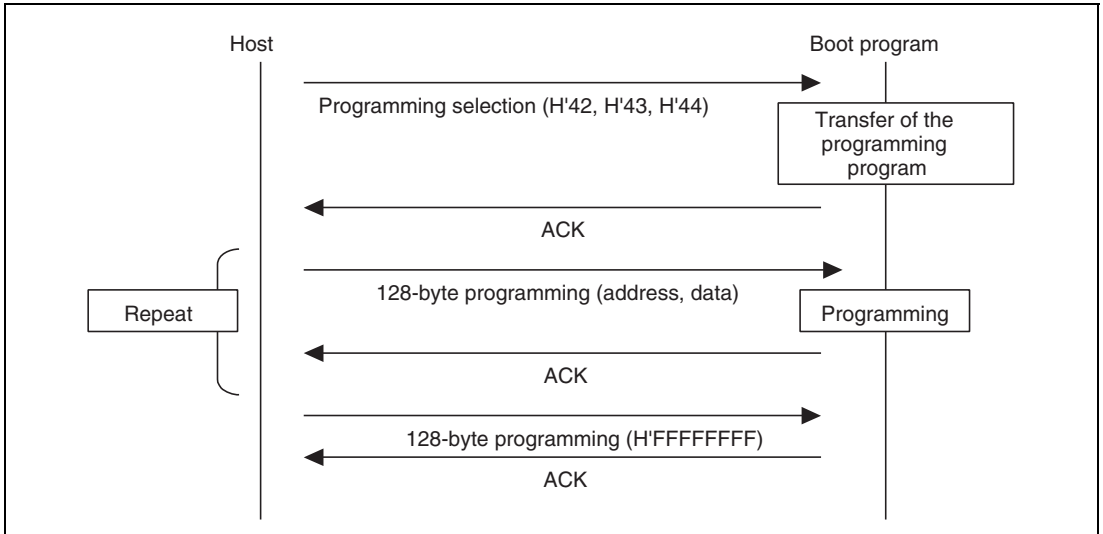

Programming is executed by a programming-selection command and a 128-byte programming command.

Firstly, the host should send the programming-selection command and select the programming method and programming ROMs. The programming selection command is user ROM programming selection, regardless of the area and method for programming.

After issuing the programming selection command, the host should send the 128-byte programming command. The 128-byte programming command that follows the selection command represents the data programmed according to the method specified by the selection command. When more than 128-byte data is programmed, 128-byte commands should repeatedly be executed. Sending a 128-byte programming command with H'FFFFFFFF as the address will stop the programming. On completion of programming, the boot program will wait for selection of programming or erasing.

Where the sequence of programming operations that is executed includes programming with another method or of another ROM, the procedure must be repeated from the programming selection command.

The sequence for programming-selection and 128-byte programming commands is shown in figure 21.12.

**Figure 21.12 Programming Sequence**

### (a) User-Program Programming Selection

The boot program will transfer a program for programming. The data is programmed to the user ROMs by the transferred program for programming.

Command H'43

- Command, H'43, (1 byte): User-program programming selection

Response H'06

- Response, H'06, (1 byte): Response to user-program programming selection

When the programming program has been transferred, the boot program will return ACK.

Error response H'C3 ERROR

- Error response, H'C3, (1 byte): Error response for user-program programming selection
- ERROR: (1 byte): Error code
  - H'54: Selection processing error (transfer error occurs and processing is not completed)

## (b) 128-Byte Programming

The boot program will use the programming program transferred by the programming selection to program the user ROMs in response to 128-byte programming.

|         |      |         |  |  |  |  |  |  |
|---------|------|---------|--|--|--|--|--|--|
| Command | H'50 | Address |  |  |  |  |  |  |
|         | Data | ...     |  |  |  |  |  |  |
|         | ...  |         |  |  |  |  |  |  |
|         | SUM  |         |  |  |  |  |  |  |

- Command, H'50, (1 byte): 128-byte programming
- Programming address (4 bytes): Start address for programming  
Multiple of the size specified in response to the programming unit inquiry (i.e. H'00, H'01, H'00, H'00: H'0001 0000)
- Programming data (128 bytes): Data to be programmed  
The size is specified in the response to the programming unit inquiry.
- SUM (1 byte): Checksum

Response 

|      |
|------|
| H'06 |
|------|

- Response, H'06, (1 byte): Response to 128-byte programming  
On completion of programming, the boot program will return ACK.

Error response 

|      |       |
|------|-------|
| H'D0 | ERROR |
|------|-------|

- Error response, H'D0, (1 byte): Error response for 128-byte programming
- ERROR: (1 byte): Error code  
H'11: Sum check error  
H'2A: Address error  
The address is not within the specified ROM.  
H'53: Programming error  
A programming error has occurred and programming cannot be continued.

The specified address should match the unit for programming of data. For example, when the programming is in 128-byte units, the lower byte of the address should be H'00 or H'80. When there are less than 128 bytes of data to be programmed, the host should fill the rest with H'FF.

**(c) Programming End**

Sending the 128-byte programming command with the address of H'FFFFFFFF will stop the programming operation. The boot program will interpret this as the end of the programming and wait for selection of programming or erasing.

|         |      |         |     |
|---------|------|---------|-----|
| Command | H'50 | Address | SUM |
|---------|------|---------|-----|

- Command, H'50, (1 byte): 128-byte programming
- Programming address (4 bytes): End code is H'FF, H'FF, H'FF, H'FF.
- SUM (1 byte): Checksum

|          |      |
|----------|------|
| Response | H'06 |
|----------|------|

- Response, H'06, (1 byte): Response to 128-byte programming  
On completion of programming, the boot program will return ACK.

|                |      |       |
|----------------|------|-------|
| Error response | H'D0 | ERROR |
|----------------|------|-------|

- Error response, H'D0, (1 byte): Error response for 128-byte programming
- ERROR: (1 byte): Error code

H'11: Sum check error

H'53: Programming error

An error has occurred in programming and programming cannot be continued.

## (10) Erasure

Erasure is performed with the erasure selection and block erasure command.

Firstly, erasure is selected by the erasure selection command and the boot program then erases the specified block. The command should be repeatedly executed if two or more blocks are to be erased. Sending a block-erasure command from the host with the block number H'FF will stop the erasure operating. On completion of erasing, the boot program will wait for selection of programming or erasing.

The sequences of the issuing of erasure selection commands and the erasure of data are shown in figure 21.13.

**Figure 21.13 Erasure Sequence**

**(a) Erasure Selection**

The boot program will transfer the erasure program. User ROM data is erased by the transferred erasure program.

Command 

|      |
|------|
| H'48 |
|------|

- Command, H'48, (1 byte): Erasure selection

Response 

|      |
|------|
| H'06 |
|------|

- Response, H'06, (1 byte): Response for erasure selection

After the erasure program has been transferred, the boot program will return ACK.

Error response 

|      |       |
|------|-------|
| H'C8 | ERROR |
|------|-------|

- Error response, H'C8, (1 byte): Response to erasure selection
- ERROR (1 byte): Error code
  - H'54: Selection processing error (transfer error occurs and processing is not completed)

**(b) Block Erasure**

The boot program will erase the contents of the specified block.

Command 

|      |      |              |     |
|------|------|--------------|-----|
| H'58 | Size | Block number | SUM |
|------|------|--------------|-----|

- Command, H'58, (1 byte): Block erasure
- Size (1 byte): The number of bytes that represents the erasure block number
  - This is fixed to 1.
- Block number (1 byte): Number of the block to be erased
- SUM (1 byte): Checksum

Response 

|      |
|------|
| H'06 |
|------|

- Response, H'06, (1 byte): Response to Erasure

After erasure has been completed, the boot program will return ACK.

Error response 

|      |       |
|------|-------|
| H'D8 | ERROR |
|------|-------|

- Error response, H'D8, (1 byte): Response to block erasure
- ERROR (1 byte): Error code
  - H'11: Sum check error
  - H'29: Block number error
    - Block number is incorrect.
  - H'51: Erasure error
    - An error has occurred during erasure.

## (11) Memory Read

The boot program will return the data stored in the specified address in response to a memory read command.

|         |           |      |      |              |     |  |  |
|---------|-----------|------|------|--------------|-----|--|--|
| Command | H'52      | Size | Area | Read address |     |  |  |
|         | Read size |      |      |              | SUM |  |  |

- Command, H'52, (1 byte): Memory read
- Size (1 byte): Amount of data that represents the area, read address, and read size (fixed at 9)
- Area (1 byte):  
H'01: User ROM area  
An address error occurs when the area setting is incorrect.
- Read address (4 bytes): Start address to be read from
- Read size (4 bytes): Size of data to be read
- SUM (1 byte): Checksum

|          |      |           |  |  |  |  |  |  |
|----------|------|-----------|--|--|--|--|--|--|
| Response | H'52 | Read size |  |  |  |  |  |  |
|          | Data | ...       |  |  |  |  |  |  |
|          | SUM  |           |  |  |  |  |  |  |

- Response H'52 (1 byte): Response to memory read
- Read size (4 bytes): Size of data to be read
- Data (n bytes): Data for the read size from the read address
- SUM (1 byte): Checksum

|                |      |       |
|----------------|------|-------|
| Error response | H'D2 | ERROR |
|----------------|------|-------|

- Error response: H'D2 (1 byte): Error response to memory read
- ERROR: (1 byte): Error code  
H'11: Sum check error  
H'2A: Address error  
The read address is not in the ROM.  
H'2B: Data size error  
The read size is greater than the size of the ROM.

## (12) User ROM Sum Check

The boot program will add all the data bytes in the user ROM area and return the result in response to a user ROM sum check command.

Command 

|      |
|------|
| H'4B |
|------|

- Command, H'4B, (1 byte): Sum check for user ROM

Response 

|      |      |                      |     |
|------|------|----------------------|-----|
| H'5B | Size | Checksum of user ROM | SUM |
|------|------|----------------------|-----|

- Response, H'5B, (1 byte): Response to the user ROM sum check
- Size (1 byte): The number of bytes that represents the checksum  
This is fixed to 4.
- Checksum of user ROM (4 bytes): Result of checksum calculation for the user ROM area; the total of all the data in the ROM, in byte units.
- SUM (1 byte): Sum check for data being transmitted

## (13) Data Flash Sum Check

The boot program will add all the data bytes in the data flash area and return the result in response to a data flash sum check command.

Command 

|      |
|------|
| H'61 |
|------|

- Command, H'61, (1 byte): Sum check for data flash

Response 

|      |      |                        |     |
|------|------|------------------------|-----|
| H'71 | Size | Checksum of data flash | SUM |
|------|------|------------------------|-----|

- Response, H'71, (1 byte): Response to the data flash sum check
- Size (1 byte): The number of bytes that represents the checksum  
This is fixed to 4.
- Checksum of data flash (4 bytes): Result of checksum calculation for the data flash area; the total of all the data in the data flash, in byte units.
- SUM (1 byte): Checksum value that makes the sum of the bytes from the command to the SUM byte become H'00.

#### (14) User ROM Blank Check

The boot program will check to see if the whole user ROM area is blank and return the result in response to a user ROM blank check command.

Command

- Command, H'4D, (1 byte): Blank check for user ROM

Response

- Response, H'06, (1 byte): Response to the user ROM blank check

If all user ROM areas are blank (H'FF), the boot program will return ACK.

Error response

- Error response, H'CD, (1 byte): Error response to blank check for user ROM
- Error code, H'52, (1 byte): Erasure incomplete error

#### (15) Data Flash Blank Check

The boot program will check to see if the whole data flash area is blank and return the result in response to a data flash blank check command.

Command

- Command, H'62, (1 byte): Blank check for data flash

Response

- Response, H'06, (1 byte): Response to the data flash blank check

If all data flash areas are blank (H'FF), the boot program will return ACK.

Error response

- Error response, H'E2, (1 byte): Error response to blank check for data flash
- Error code, H'52, (1 byte): Erasure incomplete error

## (16) Boot Program Status Inquiry

The boot program will return indications of its present state and error condition in response to a boot program status inquiry command. This inquiry can be made in the inquiry/selection state or the programming/erasing state.

Command 

|      |
|------|
| H'4F |
|------|

- Command, H'4F, (1 byte): Inquiry regarding boot program states

Response 

|      |      |        |       |     |
|------|------|--------|-------|-----|
| H'5F | Size | STATUS | ERROR | SUM |
|------|------|--------|-------|-----|

- Response, H'5F, (1 byte): Response to the boot program state inquiry
- Size (1 byte): The number of bytes. This is fixed to 2.
- STATUS (1 byte): State of the boot program

**Table 21.10 Status Code**

| Code | Description   |
|------|---|
| H'11 | Device selection wait   |
| H'12 | Clock mode selection wait   |
| H'13 | Bit rate selection wait   |
| H'1F | Programming/erasing state transition wait (Bit rate selection is completed) |
| H'31 | Programming state for erasure   |
| H'3F | Programming/erasing selection wait (erasure completed)                      |
| H'4F | Programming data transmit wait (programming completed)                      |
| H'5F | Erasure block specification wait (erasure completed)                        |

- **ERROR (1 byte):** Error status  
 ERROR = 0 indicates normal operation.  
 ERROR = 1 indicates error has occurred.

**Table 21.11 Error Code**

| <b>Code</b> | <b>Description</b>                     |
|-------------|--|
| H'00        | No error                               |
| H'11        | Sum check error                        |
| H'12        | Program size error                     |
| H'21        | Device code mismatch error             |
| H'22        | Clock mode mismatch error              |
| H'24        | Bit-rate selection disable error       |
| H'25        | Input frequency error                  |
| H'26        | Multiplication ratio error             |
| H'27        | Operating frequency error              |
| H'29        | Block number error                     |
| H'2A        | Address error                          |
| H'2B        | Data size error                        |
| H'51        | Erase error                            |
| H'52        | Erase incomplete error                 |
| H'53        | Programming error                      |
| H'54        | Selection processing error             |
| H'80        | Command error                          |
| H'FF        | Bit-rate-adjustment confirmation error |

- **SUM (1 byte):** Sum check

## 21.11 Programmer Mode

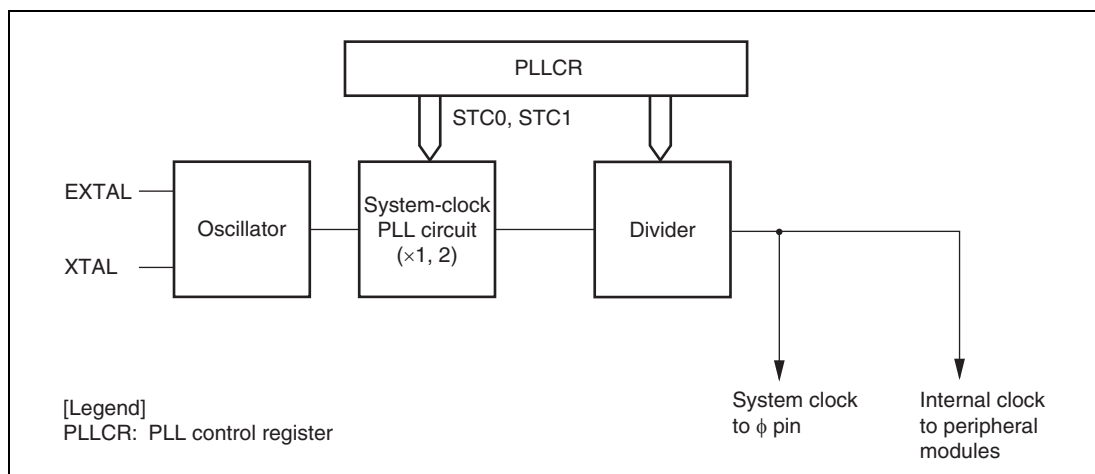

Along with the on-board programming mode, this LSI also has a programmer mode as a further mode for the writing and erasing of programs and data. In the programmer mode, a general-purpose PROM programmer can be used to freely write programs to the on-chip ROM. Program/erase is possible on the user ROM. The PROM programmer must support Renesas microcomputers with 256-Kbyte flash memory as a device type.

A status-polling system is adopted for operation in automatic program, automatic erase, and status-read modes. In the status-read mode, details of the system's internal signals are output after execution of automatic programming or automatic erasure. In the PROM mode, provide a 12-MHz input-clock signal.

## Section 22 Clock Pulse Generator

This LSI has an on-chip clock pulse generator (CPG) that generates the system clock ( $\phi$ ) and internal clocks. The clock pulse generator consists of an oscillator circuit, a system-clock PLL circuit and a divider.

Figure 22.1 shows a block diagram of the clock pulse generator.

**Figure 22.1 Block Diagram of Clock Pulse Generator**

The frequency of the system clock from the oscillator can be changed by means of the system-clock PLL circuit and divider. Frequency changes are made by software by means of settings in the PLL control register (PLLCR).

## 22.1 Register Descriptions

The clock pulse generator has the following registers.

- System clock control register (SCKCR)
- PLL control register (PLLCR)

### 22.1.1 System Clock Control Register (SCKCR)

SCKCR controls  $\phi$  clock output and selects operation when the PLLCR register setting is changed.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | PSTOP    | 0             | R/W | $\phi$ Clock Output Disable<br>Controls $\phi$ output.<br>Normal Operation<br>0: $\phi$ output<br>1: Fixed high<br>Sleep Mode<br>0: $\phi$ output<br>1: Fixed high<br>Software Standby Mode<br>0: Fixed high<br>1: Fixed high<br>Hardware Standby Mode<br>0: High impedance<br>1: High impedance<br>All module clock stop mode<br>0: $\phi$ output<br>1: Fixed high |
| 6   | —        | 0             | R/W | Reserved<br>This bit can be read from or written to. However, the write value should always be 0.   |

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 5   | SDPSTP*  | 0             | R/W | <p>SDRAM<math>\phi</math> Output Disable</p> <p>Controls SDRAM<math>\phi</math>.</p> <p>0: SDRM<math>\phi</math> output.</p> <p>1: Can be used as PH1/<math>\overline{\text{CS5}}</math>/<math>\overline{\text{RAS5}}</math>.</p> <p>When the SDRAM<math>\phi</math> output is selected, the pin functions as follows in each power-down mode.</p> <p>Normal operation: SDRAM<math>\phi</math> output</p> <p>Sleep mode: SDRAM<math>\phi</math> output</p> <p>Software standby mode: Fixed at a low level</p> <p>Hardware standby mode: High-impedance state</p> <p>All module clock stop mode: SDRAM<math>\phi</math> output</p> |
| 4   | —        | 0             | —   | <p>Reserved</p> <p>This bit is always read as 0 and cannot be modified.</p>   |
| 3   | STCS     | 0             | R/W | <p>Frequency Multiplication Factor Switching Mode Select</p> <p>Selects the operation when the PLLCR register setting is changed.</p> <p>0: Specified multiplication factor is valid after transition to software standby mode.</p> <p>1: Specified multiplication factor is valid immediately after STC1 and STC0 bits are rewritten.</p>  |
| 2   | —        | 0             | R/W | Reserved  |
| 1   | —        | 0             | R/W | These bits are always read as 0 and cannot be modified.   |
| 0   | —        | 0             | R/W | These bits are always read as 0 and cannot be modified.   |

Note: \* The H8S/2426 group and H8S/2424 group do not have this bit. The pin always functions as an I/O port regardless of this bit setting.

### 22.1.2 PLL Control Register (PLLCR)

PLLCR sets the frequency multiplication factor used by the system-clock PLL circuit.

Care must be taken when writing to this register. For details, see section 22.3, System-Clock PLL Circuit and Divider.

| Bit    | Bit Name | Initial Value | R/W | Description   |
|--------|----------|---------------|-----|---|
| 7 to 4 | —        | All 0         | —   | Reserved<br>These bits are always read as 0 and cannot be modified.   |
| 3      | —        | 0             | R/W | Reserved<br>This bit can be read from or written to. However, the write value should always be 0.   |
| 2      | —        | 0             | —   | Reserved<br>This bit is always read as 0 and cannot be modified.  |
| 1      | STC1     | 0             | R/W | Frequency Multiplication Factor for System-Clock PLL Circuit and System Clock Divider Setting<br>The STC bits specify the frequency multiplication factor and dividing ratio with respect to the oscillator frequency.<br>00: $\times 1$<br>01: $\times 2$<br>10: Setting prohibited<br>11: $1/2$ |
| 0      | STC0     | 0             | R/W |   |

## 22.2 Oscillator

Clock pulses can be supplied by connecting a crystal resonator, or by input of an external clock.

### 22.2.1 Connecting a Crystal Resonator

A crystal resonator can be connected as shown in the example in figure 22.2. Select the damping resistance  $R_d$  according to table 22.1. An AT-cut parallel-resonance type should be used. When a crystal resonator is used, the range of its frequencies is from 8 to 20 MHz.

Figure 22.3 shows the equivalent circuit of the crystal resonator. Use a crystal resonator that has the characteristics shown in table 22.2.

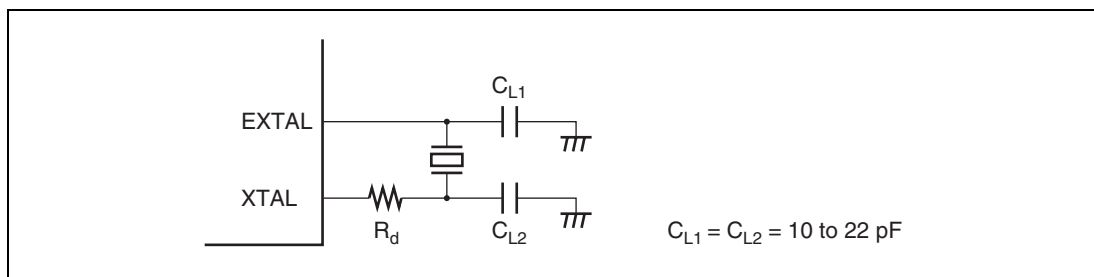

Figure 22.2 Connection of Crystal Resonator (Example)

Table 22.1 Damping Resistance Value

| Frequency (MHz)    | 8   | 12 | 16 | 20 |
|--------------------|-----|----|----|----|
| $R_d$ ( $\Omega$ ) | 200 | 0  | 0  | 0  |

Figure 22.3 Crystal Resonator Equivalent Circuit

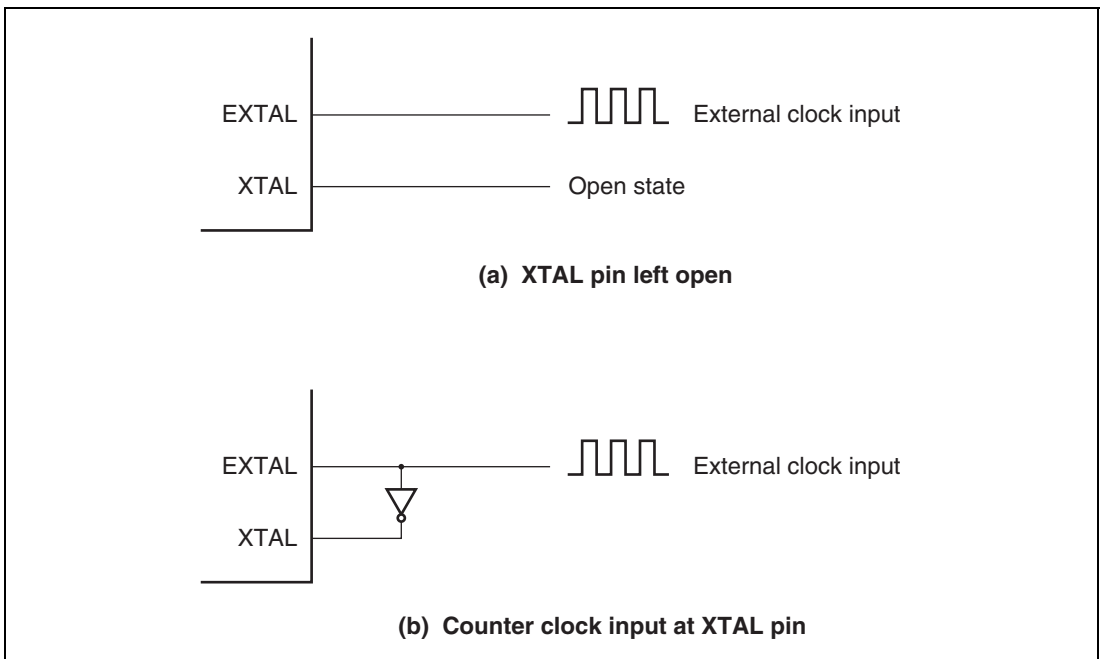

**Table 22.2 Crystal Resonator Characteristics**

| Frequency (MHz)        | 8  | 12 | 16 | 20 |
|------------------------|----|----|----|----|
| $R_s$ max ( $\Omega$ ) | 80 | 60 | 50 | 40 |
| $C_0$ max (pF)         | 7  | 7  | 7  | 7  |

### 22.2.2 External Clock Input

An external clock signal can be input as shown in the examples in figure 22.4. If the XTAL pin is left open, make sure that parasitic capacitance is no more than 10 pF. When the counter clock is input to the XTAL pin, make sure that the external clock is held high in standby mode.

Table 22.3 shows the input conditions for the external clock. When an external clock is used, the range of its frequencies is from 8 to 20 MHz.

**Figure 22.4 Connection of External Clock Input (Examples)**

**Table 22.3 External Clock Input Conditions**

| Item                                  | Symbol    | $V_{CC} = 3.0\text{ V to }3.6\text{ V}$ |     | $V_{CC} = 4.5\text{ V to }5.5\text{ V}$ |     | Unit      | Test Conditions |
|---------------------------------------|-----------|---|-----|---|-----|-----------|-----------------|
|                                       |           | Min                                     | Max | Min                                     | Max |           |                 |
| External clock input low pulse width  | $t_{EXL}$ | 20                                      | —   | 20                                      | —   | ns        | Figure 22.5     |
| External clock input high pulse width | $t_{EXH}$ | 20                                      | —   | 20                                      | —   | ns        |                 |
| External clock rise time              | $t_{EXr}$ | —                                       | 5   | —                                       | 5   | ns        |                 |
| External clock fall time              | $t_{EXf}$ | —                                       | 5   | —                                       | 5   | ns        |                 |
| Clock low pulse width                 | $t_{CL}$  | 0.4                                     | 0.6 | 0.4                                     | 0.6 | $t_{cyc}$ |                 |
| Clock high pulse width                | $t_{CH}$  | 0.4                                     | 0.6 | 0.4                                     | 0.6 | $t_{cyc}$ |                 |

**Figure 22.5 External Clock Input Timing**

## 22.3 System-Clock PLL Circuit and Divider

The system-clock PLL circuit and divider have the function of multiplying the frequency of the clock from the oscillator by a factor of 1, 2, or dividing by 2. The system clock frequency is set with the STC1 and STC0 bits in PLLCR. The phase of the rising edge of the internal clock is controlled so as to match that of the rising edge of the EXTAL pin.

When the frequency is changed with the system-clock PLL circuit and divider, operation varies according to the setting of the STCS bit in SCKCR.

When  $STCS = 0$ , the setting of the changed frequency becomes valid after a transition to software standby mode. The transition time count is performed in accordance with the setting of bits STS3 to STS0 in SBYCR. For details on SBYCR, see section 23.1.1, Standby Control Register (SBYCR).

1. The initial PLL circuit multiplication factor is 1.
2. A value is set in bits STS3 to STS0 to give the specified transition time.
3. The target value is set in bits STC1 and STC0, and a transition is made to software standby mode.
4. The clock pulse generator stops and the value set in STC1 and STC0 becomes valid.
5. Software standby mode is cleared, and a transition time is secured in accordance with the setting in STS3 to STS0.
6. After the set transition time has elapsed, this LSI resumes operation using the target multiplication factor.

When  $STCS = 1$ , a change to the frequency setting becomes effective a maximum of four cycles after the setting is changed. If the clock frequency is changed during access to an external address space, correct operation cannot be guaranteed. Therefore, be sure to store instructions that change the STC1 and STC0 bits and other instructions to be executed within a maximum of four cycles after the change to the frequency setting in on-chip ROM or on-chip RAM, so that instructions do not access an external address space before the frequency clock is switched over.

## 22.4 Usage Notes

### 22.4.1 Notes on Clock Pulse Generator

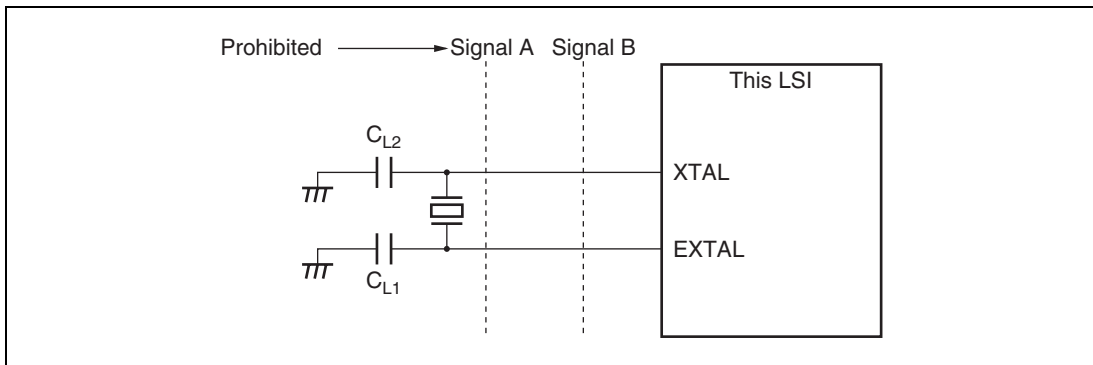

1. The following points should be noted since the frequency of  $\phi$  changes according to the settings of PLLCR.  
Select a clock division ratio that is within the operation guaranteed range of clock cycle time  $t_{cyc}$  shown in the AC timing of the Electrical Characteristics. In other words,  $\phi$  must be set to a value between 8 MHz (minimum) and 33 MHz (maximum). The setting of  $\phi$  must not be less than 8 MHz or greater than 33 MHz.
2. All the on-chip peripheral modules operate on the  $\phi$ . Therefore, note that the time processing of modules such as a timer and SCI differ before and after changing the clock division ratio. In addition, wait time for clearing software standby mode differs by changing the clock division ratio. See the description, Setting Oscillation Stabilization Time after Clearing Software Standby Mode in section 23.2.3, Software Standby Mode, for details.
3. Note that the frequency of  $\phi$  will be changed when setting PLLCR while executing the external bus cycle with the write-data-buffer function.

### 22.4.2 Notes on Resonator

Since various characteristics related to the resonator are closely linked to the user's board design, thorough evaluation is necessary on the user's part, using the resonator connection examples shown in this section as a guide. As the parameters for the oscillation circuit will depend on the floating capacitance of the resonator and the user board, the parameters should be determined in consultation with the resonator manufacturer. The design must ensure that a voltage exceeding the maximum rating is not applied to the resonator pin.

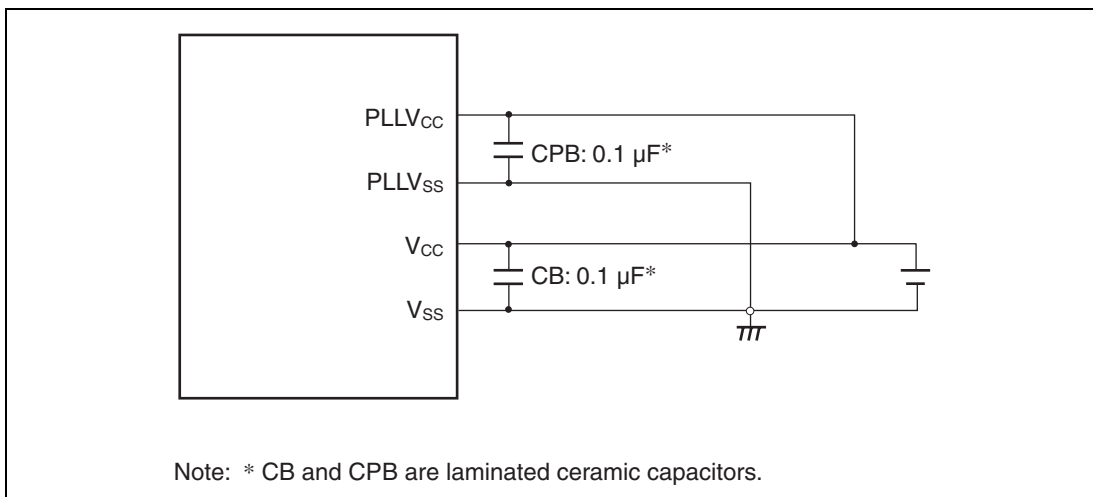

### 22.4.3 Notes on Board Design

When using the crystal resonator, place the crystal resonator and its load capacitors as close as possible to the XTAL and EXTAL pins. Other signal lines should be routed away from the oscillation circuit to prevent induction from interfering with correct oscillation. See figure 22.6.

**Figure 22.6 Note on Board Design for Oscillation Circuit**

Figure 22.7 shows the external circuitry recommended for the PLL circuit. Separate PLLV<sub>CC</sub> and PLLV<sub>SS</sub> from the other V<sub>CC</sub> and V<sub>SS</sub> lines at the board power supply source, and be sure to insert bypass capacitors CPB and CB close to the pins.

**Figure 22.7 Recommended External Circuitry for PLL Circuit**

## Section 23 Power-Down Modes

In addition to the normal program execution state, this LSI has power-down modes in which operation of the CPU and oscillator is halted and power consumption is reduced. Low-power operation can be achieved by individually controlling the CPU, on-chip peripheral modules, and so on.

This LSI's operating modes are high-speed mode and six power down modes:

- Clock division mode
- Sleep mode
- Module stop function
- All module clocks stop mode
- Software standby mode
- Hardware standby mode

Sleep mode is a CPU state, clock division mode is an on-chip peripheral function (including bus masters and the CPU) state, and module stop function is an on-chip peripheral function (including bus masters other than the CPU) state. A combination of these modes can be set.

After a reset, this LSI is in high-speed mode.

Table 23.1 shows the internal states of this LSI in each mode. Figure 23.1 shows the mode transition diagram.

**Table 23.1 Operating Modes and Internal states of the LSI**

| Operating State       |                              | High Speed Mode | Clock Division Mode | Sleep Mode | Module Stop Function                    | All Module Clocks Stop Mode                 | Software Standby Mode                   | Hardware Standby Mode |
|-----------------------|------------------------------|-----------------|---------------------|------------|---|---|---|-----------------------|
| Clock pulse generator |                              | Operating       | Operating           | Operating  | Operating                               | Operating                                   | Stopped                                 | Stopped               |
| CPU                   | Instruction execution        | Operating       | Operating           | Stopped    | Operating                               | Stopped                                     | Stopped                                 | Stopped               |

- Notes: Stopped (Retained) in the table means that internal register values are retained and internal operations are suspended.
- Stopped (Reset) in the table means that internal register values and internal states are initialized.
- In module stop function, only modules for which a stop setting has been made are stopped (reset or retained).
1. IRQ8 to IRQ15 are not supported by the H8S/2424 group.
  2. The active or stopped state can be selected by means of the MSTP0 bit in MSTPCR.
  3. Not supported by the H8S/2424 group.
  4. TDR, SSR, and RDR are stopped (reset) and other registers are stopped (retained).
  5. BC2 to BC0 are stopped (reset) and other registers are stopped (retained).
  6. The active or stopped state can be selected by means of the bits in RMMSTPCR.

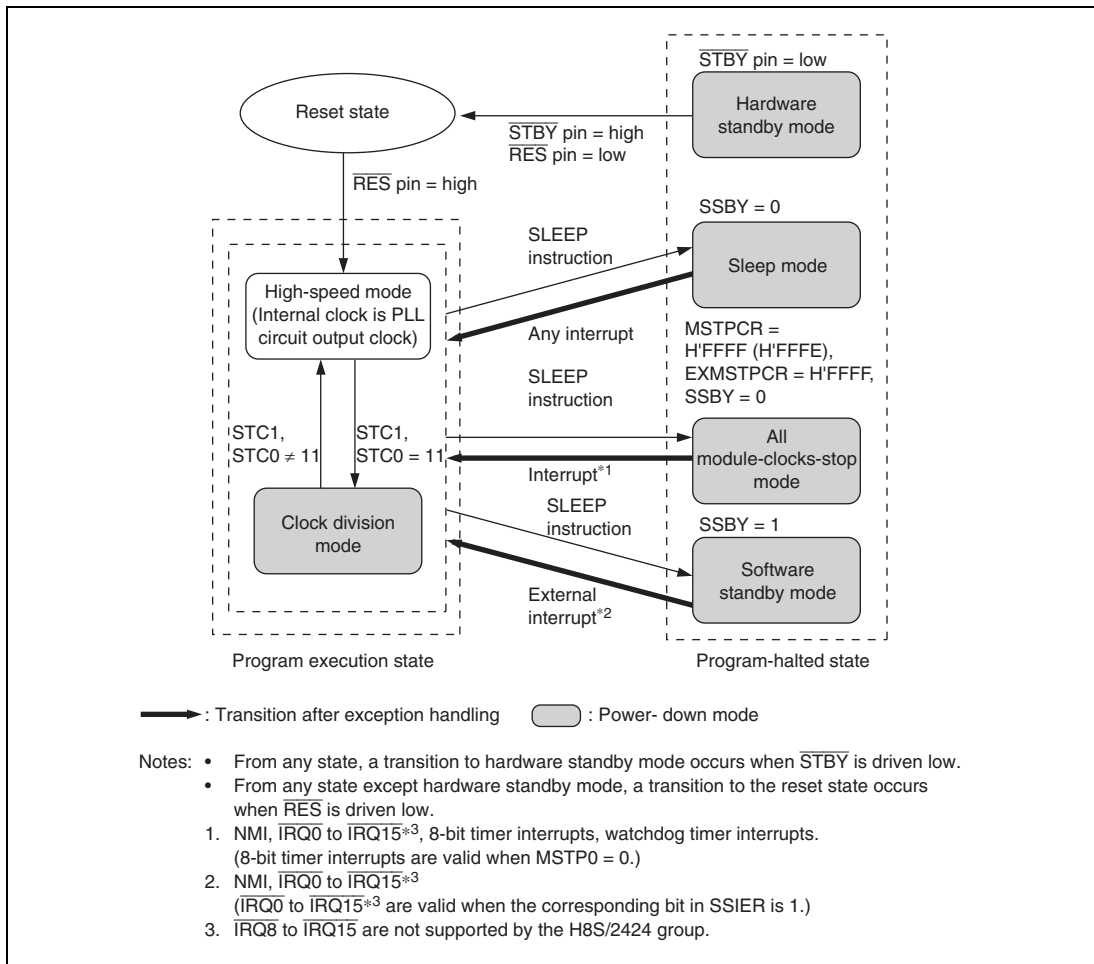

Figure 23.1 Mode Transitions

## 23.1 Register Descriptions

The registers relating to the power-down mode are shown below. For details on the PLL control register (PLLCR), see section 22.1.2, PLL Control Register (PLLCR).

- PLL control register (PLLCR)
- Standby control register (SBYCR)
- Module stop control register H (MSTPCRH)
- Module stop control register L (MSTPCRL)
- Extension module stop control register H (EXMSTPCRH)
- Extension module stop control register L (EXMSTPCRL)
- RAM module stop control register H (RMMSTPCRH)
- RAM module stop control register L (RMMSTPCRL)

### 23.1.1 Standby Control Register (SBYCR)

SBYCR performs software standby mode control.

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 7   | SSBY     | 0             | R/W | <p>Software Standby</p> <p>This bit specifies the transition mode after executing the SLEEP instruction</p> <p>0: Shifts to sleep mode after the SLEEP instruction is executed</p> <p>1: Shifts to software standby mode after the SLEEP instruction is executed</p> <p>This bit does not change from 1 when clearing the software standby mode by using external interrupts and shifting to normal operation. This bit should be written 0 when clearing.</p>  |
| 6   | OPE      | 1             | R/W | <p>Output Port Enable</p> <p>Specifies whether the output of the address bus and bus control signals (<math>\overline{CS0}</math> to <math>\overline{CS7}</math>, <math>\overline{AS}</math>, <math>\overline{RD}</math>, <math>\overline{HWR}</math>, <math>\overline{LWR}</math>, <math>\overline{UCAS^*}</math>, <math>\overline{LCAS^*}</math>) is retained or set to the high-impedance state in software standby mode.</p> <p>0: In software standby mode, address bus and bus control signals are high-impedance</p> <p>1: In software standby mode, address bus and bus control signals retain output state</p> |

| Bit | Bit Name | Initial Value | R/W | Description   |
|-----|----------|---------------|-----|---|
| 5   | —        | 0             | —   | Reserved<br>This bit is always read as 0. The initial value should not be changed.  |
| 4   | —        | 0             | —   | Reserved<br>This bit is always read as 0. The write value should always be 0.   |
| 3   | STS3     | 1             | R/W | Standby Timer Select 3 to 0   |
| 2   | STS2     | 1             | R/W | These bits select the time the MCU waits for the clock to stabilize when software standby mode is cleared by an external interrupt. With crystal oscillation, see table 23.2 and make a selection according to the operating frequency so that the standby time is at least the oscillation stabilization time. With an external clock, a PLL circuit stabilization time is necessary. See table 23.2 to set the standby time. When DRAM is used and self-refreshing in the software standby state is selected, note that the DRAM's tRAS (self-refresh RAS pulse width) specification must be satisfied.<br>0000: Setting prohibited<br>0001: Setting prohibited<br>0010: Setting prohibited<br>0011: Setting prohibited<br>0100: Setting prohibited<br>0101: Standby time = 64 states<br>0110: Standby time = 512 states<br>0111: Standby time = 1024 states<br>1000: Standby time = 2048 states<br>1001: Standby time = 4096 states<br>1010: Standby time = 16384 states<br>1011: Standby time = 32768 states<br>1100: Standby time = 65536 states<br>1101: Standby time = 131072 states<br>1110: Standby time = 262144 states<br>1111: Standby time = 524288 states |
| 1   | STS1     | 1             | R/W |   |
| 0   | STS0     | 1             | R/W |   |

Note: \* Not included in the 5-V version.

### 23.1.2 Module Stop Control Registers H and L (MSTPCRH, MSTPCRL)

MSTPCR performs module stop state control. Setting a bit to 1, the corresponding module enters the module stop state, while clearing the bit to 0 clears the module stop state.

- MSTPCRH

| Bit | Bit Name | Initial Value | R/W | Module  |
|-----|----------|---------------|-----|---|
| 15  | ACSE     | 0             | R/W | All Module Clocks Stop Mode Enable<br>Enables or disables all module clocks stop mode, in which, when the CPU executes a SLEEP instruction after the module stop state has been set for all the on-chip peripheral functions controlled by MSTPCR and EXMSTPCR or the on-chip peripheral functions except the TMR.<br>0: All module clocks stop mode disabled<br>1: All module clocks stop mode enabled |
| 14  | MSTP14   | 0             | R/W | EXDMA controller (EXDMAC)*  |
| 13  | MSTP13   | 0             | R/W | DMA controller (DMAC)   |
| 12  | MSTP12   | 0             | R/W | Data transfer controller (DTC)  |
| 11  | MSTP11   | 1             | R/W | 16-bit timer pulse unit 0 (TPU_0)   |
| 10  | MSTP10   | 1             | R/W | Programmable pulse generator (PPG)  |
| 9   | MSTP9    | 1             | R/W | 16-bit timer pulse unit 1 (TPU_1)   |
| 8   | MSTP8    | 1             | R/W | D/A converter (channels 2 and 3)  |

Note: \* Not supported by the H8S/2424 group.

- MSTPCRL

| Bit | Bit Name | Initial Value | R/W | Module                                   |
|-----|----------|---------------|-----|--|
| 7   | MSTP7    | 1             | R/W | A/D converter unit 1                     |
| 6   | MSTP6    | 1             | R/W | A/D converter unit 0                     |
| 5   | MSTP5    | 1             | R/W | Serial communication interface 4 (SCI_4) |
| 4   | MSTP4    | 1             | R/W | Serial communication interface 3 (SCI_3) |
| 3   | MSTP3    | 1             | R/W | Serial communication interface 2 (SCI_2) |
| 2   | MSTP2    | 1             | R/W | Serial communication interface 1 (SCI_1) |
| 1   | MSTP1    | 1             | R/W | Serial communication interface 0 (SCI_0) |
| 0   | MSTP0    | 1             | R/W | 8-bit timer (TMR)                        |

### 23.1.3 Extension Module Stop Control Registers H and L (EXMSTPCRH, EXMSTPCRL)

EXMSTPCR performs module stop state control. Setting a bit to 1, the corresponding module enters the module stop state, while clearing the bit to 0 clears the module stop state. When entering all module clocks stop mode, set EXMSTPCR to H'FFFF.

- EXMSTPCRH

| Bit | Bit Name | Initial Value | R/W | Module |
|-----|----------|---------------|-----|--------|
| 15  | MSTP31   | 1             | R/W | —      |
| 14  | MSTP30   | 1             | R/W | —      |
| 13  | MSTP29   | 1             | R/W | —      |
| 12  | MSTP28   | 1             | R/W | —      |
| 11  | MSTP27   | 1             | R/W | —      |
| 10  | MSTP26   | 1             | R/W | —      |
| 9   | MSTP25   | 1             | R/W | —      |
| 8   | MSTP24   | 1             | R/W | —      |

- EXMSTPCRL

| Bit | Bit Name | Initial Value | R/W | Module  |
|-----|----------|---------------|-----|---|
| 7   | MSTP23   | 1             | R/W | Synchronous serial communication unit (SSU)   |
| 6   | MSTP22   | 1             | R/W | I <sup>2</sup> C bus interface 2_3 (IIC2_3)   |
| 5   | MSTP21   | 1             | R/W | I <sup>2</sup> C bus interface 2_2 (IIC2_2)   |
| 4   | MSTP20   | 1             | R/W | I <sup>2</sup> C bus interface 2_1 (IIC2_1)   |
| 3   | MSTP19   | 1             | R/W | I <sup>2</sup> C bus interface 2_0 (IIC2_0)   |
| 2   | MSTP18   | 1             | R/W | Reserved<br>This bit can be read or written to. The write value should always be 1. |
| 1   | MSTP17   | 1             | R/W | Reserved<br>This bit can be read or written to. The write value should always be 1. |
| 0   | MSTP16   | 1             | R/W | —   |

### 23.1.4 RAM Module Stop Control Registers H and L (RMMSTPCRH, RMMSTPCRL)

RMMSTPCR performs module stop state control of the RAM area. Setting bits MSTP32 to MSTP39 to 1 stops the corresponding on-chip RAM area. During access to an on-chip RAM area, do not set bits MSTP32 to MSTP39 corresponding to the area to 1. While bit RAME in SYSCR is 1, and bits MSTP32 to MSTP39 are 1, do not access the corresponding RAM area.

- RMMSTPCRH

| Bit | Bit Name | Initial Value | R/W | Module |
|-----|----------|---------------|-----|--------|
| 15  | MSTP47   | 0             | R/W | —      |
| 14  | MSTP46   | 0             | R/W | —      |
| 13  | MSTP45   | 0             | R/W | —      |
| 12  | MSTP44   | 0             | R/W | —      |
| 11  | MSTP43   | 0             | R/W | —      |
| 10  | MSTP42   | 0             | R/W | —      |

## 23.2 Operation

### 23.2.1 Clock Division Mode

When bits STC1 and STC0 in PLLCR are set to 11, a transition is made to clock division mode, and the system clock frequency is divided with respect to the oscillator frequency. Clock division mode is cancelled by clearing bits STC1 and STC0 to a value other than 11. The timings of transition and clearing depend on the STCS bit setting in SCKCR. For the operation at transition and clearing, see section 22.3, System-Clock PLL Circuit and Divider.

If a SLEEP instruction is executed while the SSBY bit in SBYCR is cleared to 0, the chip enters sleep mode. When sleep mode is cleared by an interrupt, clock division mode is restored.

If a SLEEP instruction is executed while the SSBY bit in SBYCR is set to 1, the chip enters software standby mode. When software standby mode is cleared by an external or internal interrupt, clock division mode is restored.

When the RES pin is driven low, the reset state is entered and clock division mode is cleared. The same applies to a reset caused by watchdog timer overflow.

When the STBY pin is driven low, a transition is made to hardware standby mode.

## 23.2.2 Sleep Mode

### (1) Transition to Sleep Mode

When the SLEEP instruction is executed while the SSBY bit is 0 in SBYCR, the CPU enters the sleep mode. In sleep mode, CPU operation stops but the contents of the CPU's internal registers are retained. Other peripheral functions do not stop.

### (2) Exiting Sleep Mode

Sleep mode is exited by any interrupt, or signals at the  $\overline{\text{RES}}$ , or  $\overline{\text{STBY}}$  pins.

- **Exiting Sleep Mode by Interrupts:**  
When an interrupt occurs, sleep mode is exited and interrupt exception processing starts. Sleep mode is not exited if the interrupt is disabled, or interrupts other than NMI are masked by the CPU.
- **Exiting Sleep Mode by  $\overline{\text{RES}}$  Pin:**  
Setting the  $\overline{\text{RES}}$  pin level low selects the reset state. After the stipulated reset input duration, driving the  $\overline{\text{RES}}$  pin high starts the CPU performing reset exception processing.
- **Exiting Sleep Mode by  $\overline{\text{STBY}}$  Pin:**  
When the  $\overline{\text{STBY}}$  pin level is driven low, a transition is made to hardware standby mode.

### 23.2.3 Software Standby Mode

#### (1) Transition to Software Standby Mode

If a SLEEP instruction is executed when the SSBY bit in SBYCR is set to 1, software standby mode is entered. In this mode, the CPU, on-chip peripheral functions, and oscillator all stop. However, the contents of the CPU's internal registers, RAM data, and the states of on-chip peripheral functions other than the SCI, IIC, and SSU, and the states of I/O ports, are retained. Whether the address bus and bus control signals are placed in the high-impedance state or retain the output state can be specified by the OPE bit in SBYCR.

In this mode the oscillator stops, and therefore power dissipation is significantly reduced.

#### (2) Clearing Software Standby Mode

Software standby mode is cleared by an external interrupt (NMI pin, or pins  $\overline{\text{IRQ0}}$  to  $\overline{\text{IRQ15}}$ \*), or by means of the  $\overline{\text{RES}}$  pin or  $\overline{\text{STBY}}$  pin. Setting the SSI bit in SSIER to 1 enables  $\overline{\text{IRQ0}}$  to  $\overline{\text{IRQ15}}$ \* to be used as software standby mode clearing sources.

- Clearing with an Interrupt:

When an NMI or  $\overline{\text{IRQ0}}$  to  $\overline{\text{IRQ15}}$ \* interrupt request signal is input, clock oscillation starts, and stable clocks are supplied to the entire LSI after the elapse of the time set in bits STS3 to STS0 in SBYCR. Then, software standby mode is cleared, and interrupt exception handling is started.

When clearing software standby mode with an  $\overline{\text{IRQ0}}$  to  $\overline{\text{IRQ15}}$ \* interrupt, set the corresponding enable bit to 1 and ensure that no interrupt with a higher priority than interrupts  $\overline{\text{IRQ0}}$  to  $\overline{\text{IRQ15}}$ \* is generated. Software standby mode cannot be cleared if the interrupt has been masked on the CPU side or has been designated as a DTC activation source.

Note: \*  $\overline{\text{IRQ8}}$  to  $\overline{\text{IRQ15}}$  are not supported by the H8S/2424 group.

- Clearing with the  $\overline{\text{RES}}$  Pin:

When the  $\overline{\text{RES}}$  pin is driven low, clock oscillation is started. At the same time as clock oscillation starts, clocks are supplied to the entire LSI. Note that the  $\overline{\text{RES}}$  pin must be held low until clock oscillation stabilizes. When the  $\overline{\text{RES}}$  pin goes high, the CPU begins reset exception handling.

- Clearing with the  $\overline{\text{STBY}}$  Pin:

When the  $\overline{\text{STBY}}$  pin is driven low, a transition is made to hardware standby mode.

### (3) Setting Oscillation Stabilization Time after Clearing Software Standby Mode

Bits STS3 to STS0 in SBYCR should be set as described below.

- Using a Crystal Resonator:  
Set bits STS3 to STS0 so that the standby time is more than the oscillation stabilization time. Table 23.2 shows the standby times for operating frequencies and settings of bits STS3 to STS0.
- Using an External Clock:  
A PLL circuit stabilization time is necessary. See table 23.2 to set the wait time.

**Table 23.2 Oscillation Stabilization Time Settings**

| STS3 | STS2 | STS1 | STS0 | Standby Time | $\phi^*$ [MHz] |          |       |       |       |       | Unit    |       |       |       |
|------|------|------|------|--------------|----------------|----------|-------|-------|-------|-------|---------|-------|-------|-------|
|      |      |      |      |              | 33             | 25       | 20    | 13    | 10    | 8     |         |       |       |       |
| 0    | 0    | 0    | 0    | Reserved     | —              | —        | —     | —     | —     | —     | $\mu$ s |       |       |       |
|      |      |      | 1    | Reserved     | —              | —        | —     | —     | —     | —     |         |       |       |       |
|      |      |      | 1    | 0            | Reserved       | —        | —     | —     | —     | —     |         | —     |       |       |
|      |      |      |      | 1            | Reserved       | —        | —     | —     | —     | —     |         | —     |       |       |
|      |      |      | 1    | 0            | 0              | Reserved | —     | —     | —     | —     |         | —     | —     |       |
|      |      |      |      |              | 1              | 64       | 1.9   | 2.6   | 3.2   | 4.9   |         | 6.4   | 8.0   |       |
|      |      |      |      |              | 1              | 0        | 512   | 15.5  | 20.5  | 25.6  |         | 39.4  | 51.2  | 64.0  |
|      |      |      |      |              |                | 1        | 1024  | 31.0  | 41.0  | 51.2  |         | 78.8  | 102.4 | 128.0 |
| 1    | 0    | 0    | 0    | 2048         | 62.1           | 81.9     | 102.4 | 157.5 | 204.8 | 256.0 |         |       |       |       |
|      |      |      | 1    | 4096         | 0.12           | 0.16     | 0.20  | 0.32  | 0.41  | 0.51  | ms      |       |       |       |
|      |      | 1    | 0    | 16384        | 0.50           | 0.66     | 0.82  | 1.26  | 1.64  | 2.05  |         |       |       |       |
|      |      |      | 1    | 32765        | 0.99           | 1.31     | 1.64  | 2.52  | 3.28  | 4.10  |         |       |       |       |
|      |      | 1    | 0    | 0            | 65536          | 1.99     | 2.62  | 3.28  | 5.04  | 6.55  |         | 8.19  |       |       |
|      |      |      |      | 1            | 131072         | 3.97     | 5.24  | 6.55  | 10.08 | 13.11 |         | 16.38 |       |       |
|      | 1    |      |      | 0            | 262144         | 7.94     | 10.49 | 13.11 | 20.16 | 26.21 |         | 32.77 |       |       |
|      |      |      |      | 1            | 524288         | 15.89    | 20.97 | 26.21 | 40.33 | 52.43 | 65.54   |       |       |       |

Note: \*  $\phi$  is the frequency divider output.

#### (4) Software Standby Mode Application Example

Figure 23.2 shows an example in which a transition is made to software standby mode at the falling edge on the NMI pin, and software standby mode is cleared at the rising edge on the NMI pin.

In this example, after an NMI interrupt is accepted with the NMIEG bit in INTCR cleared to 0 (falling edge specification), the NMIEG bit is set to 1 (rising edge specification). And after the SSBY bit is set to 1, a SLEEP instruction is executed, causing a transition to software standby mode.

Software standby mode is then cleared at the rising edge on the NMI pin.

**Figure 23.2 Software Standby Mode Application Example**

## 23.2.4 Hardware Standby Mode

### (1) Transition to Hardware Standby Mode

When the  $\overline{\text{STBY}}$  pin is driven low, a transition is made to hardware standby mode from any mode.

In hardware standby mode, all functions enter the reset state and stop operation, resulting in a significant reduction in power dissipation. As long as the prescribed voltage is supplied, on-chip RAM data is retained. I/O ports are set to the high-impedance state.

In order to retain on-chip RAM data, the RAME bit in SYSCR should be cleared to 0 before driving the  $\overline{\text{STBY}}$  pin low. Do not change the state of the mode pins (MD2 to MD0) while this LSI is in hardware standby mode.

### (2) Clearing Hardware Standby Mode

Hardware standby mode is cleared by means of the  $\overline{\text{STBY}}$  pin and the  $\overline{\text{RES}}$  pin. When the  $\overline{\text{STBY}}$  pin is driven high while the  $\overline{\text{RES}}$  pin is low, the reset state is set and clock oscillation is started. Ensure that the  $\overline{\text{RES}}$  pin is held low until the clock oscillator stabilizes (for details on the oscillation stabilization time, see table 23.2). When the  $\overline{\text{RES}}$  pin is subsequently driven high, a transition is made to the program execution state via the reset exception handling state.

### (3) Hardware Standby Mode Timing

Figure 23.3 shows an example of hardware standby mode timing.

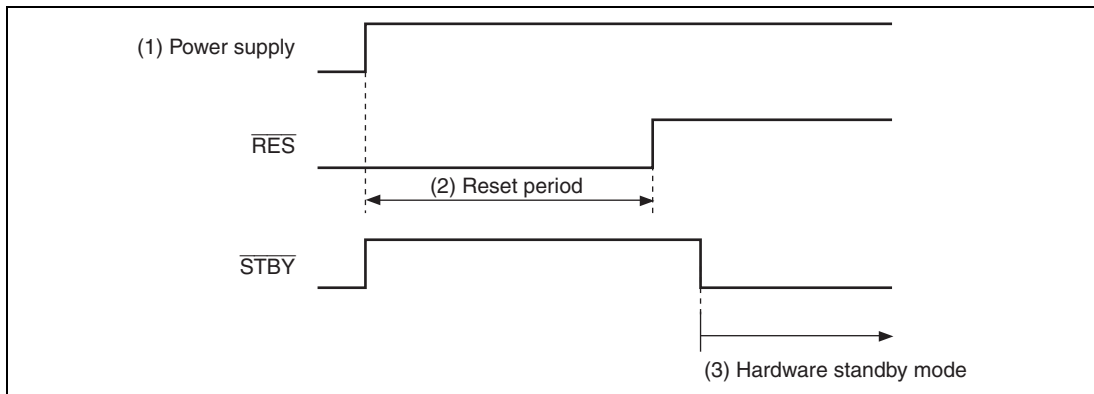

When the  $\overline{\text{STBY}}$  pin is driven low after the  $\overline{\text{RES}}$  pin has been driven low, a transition is made to hardware standby mode. Hardware standby mode is cleared by driving the  $\overline{\text{STBY}}$  pin high, waiting for the oscillation stabilization time, then changing the  $\overline{\text{RES}}$  pin from low to high.

**Figure 23.3 Hardware Standby Mode Timing**

#### (4) Hardware Standby Mode Timing when Power Is Supplied

When entering hardware standby mode immediately after the power is supplied, the  $\overline{\text{RES}}$  signal must be driven low for a given period with retaining the  $\overline{\text{STBY}}$  signal high. After the  $\overline{\text{RES}}$  signal is canceled, drive the  $\overline{\text{STBY}}$  signal low.

**Figure 23.4 Hardware Standby Mode Timing when Power Is Supplied**

### 23.2.5 Module Stop Function

Module stop function can be set for individual on-chip peripheral modules.

When an MSTP bit in MSTPCR, EXMSTPCR, or RMMSTPCR is set to 1, the corresponding module stops operation at the end of the bus cycle and a transition is made to module stop state. The CPU continues operating independently.

When an MSTP bit is cleared to 0, the corresponding module stop state is cleared and the module starts operating at the end of the bus cycle. In module stop state, part of SCI registers and the internal state of SSU are reset but the internal states of the other modules are retained.

After reset clearance, all modules other than the EXDMAC\*, DMAC, DTC, and on-chip RAM are in module stop state.

The module registers that are set in module stop state cannot be read or written to.

The module-stop function for RAM is only effective for on-chip RAM. When an area of on-chip RAM is set up as an external address space by bits RAME and EXPE in SYSCR, the resulting external space is accessible regardless of the module-stop setting. Table 23.3 lists the kinds of operation in case of access to the on-chip RAM area.

Note: \* The EXDMAC is not supported by the H8S/2424 group.

**Table 23.3 Combinations of SYSCR Settings and Operation in Access to On-Chip RAM**

| Register Settings |      |      | Target for Access      | Description  |
|-------------------|------|------|------------------------|--|
| RAME              | EXPE | mstp |                        |  |
| 1                 | X    | 1    | —                      | This area is not readable/writable and access is prohibited. |
|                   |      | 0    | On-chip RAM            |  |
| 0                 | 1    | X    | External address space |  |
|                   | 0    | X    | —                      | This area is not readable/writable and access is prohibited. |

### 23.2.6 All Module Clocks Stop Mode

When the ACSE bit in MSTPCRH is set to 1 and module stop state is set for all the on-chip peripheral functions controlled by MSTPCR or EXMSTPCR (MSTPCR = H'FFFF, EXMSTPCR = H'FFFF), or for all the on-chip peripheral functions except the 8-bit timer (MSTPCR = H'FFFE, EXMSTPCR = H'FFFF), executing a SLEEP instruction while the SSBY bit in SBYCR is cleared to 0 will cause all the on-chip peripheral functions (except the 8-bit timer and watchdog timer), the bus controller, and the I/O ports to stop operating, and a transition to be made to all module clocks stop mode at the end of the bus cycle.

Operation or stopping of the 8-bit timer can be selected by means of the MSTP0 bit.

To further reduce the current consumption in all module clocks stop mode, stop the modules controlled by RMMSTPCR (RMMSTPCR = H'FFFF).

All module clocks stop mode is cleared by an external interrupt (NMI,  $\overline{\text{IRQ0}}$  to  $\overline{\text{IRQ15}}$ \* pins),  $\overline{\text{RES}}$  pin input, or an internal interrupt (8-bit timer, watchdog timer), and the CPU returns to the normal program execution state via the exception handling state. All module clocks stop mode is not cleared if interrupts are disabled, if interrupts other than NMI are masked by the CPU, or if the relevant interrupt is designated as a DTC activation source.

When the  $\overline{\text{STBY}}$  pin is driven low, a transition is made to hardware standby mode.

Note: \*  $\overline{\text{IRQ8}}$  to  $\overline{\text{IRQ15}}$  are not supported by the H8S/2424 group.

### 23.3 $\phi$ Clock Output Control

Output of the  $\phi$  clock can be controlled by means of the PSTOP bit in SCKCR, and DDR for the corresponding port. When the PSTOP bit is set to 1, the  $\phi$  clock stops at the end of the bus cycle, and  $\phi$  output goes high.  $\phi$  clock output is enabled when the PSTOP bit is cleared to 0. When DDR for the corresponding port is cleared to 0,  $\phi$  clock output is disabled and input port mode is set. Table 23.4 shows the state of the  $\phi$  pin in each processing state.

**Table 23.4  $\phi$  Pin State in Each Processing State**

| Register Setting |       | Normal          |                | Software       | Hardware       | All Module       |
|------------------|-------|-----------------|----------------|----------------|----------------|------------------|
| DDR              | PSTOP | Operating State | Sleep Mode     | Standby Mode   | Standby Mode   | Clocks Stop Mode |
| 0                | X     | High impedance  | High impedance | High impedance | High impedance | High impedance   |
| 1                | 0     | $\phi$ output   | $\phi$ output  | Fixed high     | High impedance | $\phi$ output    |
| 1                | 1     | Fixed high      | Fixed high     | Fixed high     | High impedance | Fixed high       |

## 23.4 SDRAM $\phi$ Clock Output Control

Output of the SDRAM $\phi$  clock can be controlled by the SDPSTP bit in SCKCR. When the SDPSTP bit is set to 1, the SDRAM $\phi$  clock stops at the end of the bus cycle and the pin can be used as a general port. SDRAM $\phi$  clock output is enabled when the SDPSTP bit is cleared to 0 regardless of the DDR value. Table 23.5 shows the state of the SDRAM $\phi$  pin in each processing state.

Note: The SDRAM interface is not supported by the H8S/2426 group and H8S/2424 group.

**Table 23.5 SDRAM $\phi$  Pin State in Each Processing State**

| Register Setting |     |                           |                       |                          |                          | All Module             |
|------------------|-----|---------------------------|-----------------------|--------------------------|--------------------------|------------------------|
| SDPSTP           | DDR | Normal<br>Operating State | Sleep Mode            | Software<br>Standby Mode | Hardware<br>Standby Mode | Clocks Stop<br>Mode    |
| 0                | X   | SDRAM $\phi$ output       | SDRAM $\phi$ output   | Fixed low                | High impedance           | SDRAM $\phi$<br>output |
| 1                | 0   | High impedance            | High impedance        | High impedance           | High impedance           | High<br>impedance      |
| 1                | 1   | PH1/CS5/RAS5<br>output    | H1/CS5/RAS5<br>output | H1/CS5/RAS5<br>output    | High impedance           | H1/CS5/RAS5<br>output  |

Note: SDRAM is not available in the H8S/2426 and H8S/2424 Groups.  
In these products, this pin functions as a general pin regardless of the SDPSTP bit setting.

## 23.5 Usage Notes

### 23.5.1 I/O Port Status

In software standby mode, I/O port states are retained. Therefore, there is no reduction in current dissipation for the output current when a high-level signal is output.

### 23.5.2 Current Dissipation during Oscillation Stabilization Standby Period

Current dissipation increases during the oscillation stabilization standby period.

### 23.5.3 EXDMAC, DMAC, and DTC Module Stop

Depending on the operating status of the EXDMAC, DMAC, or DTC, the MSTP14 to MSTP13 and may not be set to 1. Setting of the EXDMAC, DMAC, or DTC module stop state should be carried out only when the respective module is not activated.

For details, see section 8, EXDMA Controller (EXDMAC), section 7, DMA Controller (DMAC), and section 9, Data Transfer Controller (DTC).

Note: The EXDMAC is not supported by the H8S/2424 group.

### 23.5.4 On-Chip Peripheral Module Interrupts

Relevant interrupt operations cannot be performed in the module stop state. Consequently, if the module stop state is entered when an interrupt has been requested, it will not be possible to clear the CPU interrupt source or the DMAC or DTC activation source.

Interrupts should therefore be disabled before entering the module stop state.

Note: The EXDMAC is not supported by the H8S/2424 group.

### 23.5.5 Writing to MSTPCR, EXMSTPCR, and RMMSTPCR

MSTPCR, EXMSTPCR, and RMMSTPCR should only be written to by the CPU.

### 23.5.6 Notes on Clock Division Mode

The following points should be noted in clock division mode.

- Select the clock division ratio by the STC1 and STC0 bits so that the frequency of  $\phi$  is within the operation guaranteed range of clock cycle time  $t_{cyc}$  shown in the Electrical Characteristics. In other words, the frequency of  $\phi$  must be 8 MHz or higher; be careful not to specify  $\phi < 8$  MHz.
- All the on-chip peripheral modules operate on the  $\phi$ . Therefore, note that the time processing of modules such as a timer and SCI differ before and after changing the clock division ratio. In addition, the wait time for clearing software standby mode differs by changing the clock division ratio.
- Note that the frequency of  $\phi$  will be changed by changing the clock division ratio.

## Section 24 List of Registers

The address list gives information on the on-chip register addresses, how the register bits are configured, and the register states in each operating mode. The information is given as shown below.

1. Register addresses (address order)
  - Registers are listed from the lower allocation addresses.
  - Registers are classified by functional modules.
  - The access size is indicated.
2. Register bits
  - Bit configurations of the registers are described in the same order as the register addresses.
  - Reserved bits are indicated by — in the bit name column.
  - For the registers of 16 or 32 bits, the MSB is described first.
3. Register states in each operating mode
  - Register states are described in the same order as the register addresses.
  - The register states described here are for the basic operating modes. If there is a specific reset for an on-chip peripheral module, see the section on that on-chip peripheral module.

## 24.1 Register Addresses (Address Order)

The data bus width indicates the numbers of bits by which the register is accessed.

The number of access states indicates the number of states based on the specified reference clock.

| Register Name                      | Abbreviation | Number of Bits | Address          | Module | Data Width | Access States |
|------------------------------------|--------------|----------------|------------------|--------|------------|---------------|
| DTC mode register A                | MRA          | 8              | H'BC00 to H'BFFF | DTC    | 16/32      | 2             |
| DTC source address register        | SAR          | 24             |                  | DTC    | 16/32      | 2             |
| DTC mode register B                | MRB          | 8              |                  | DTC    | 16/32      | 2             |
| DTC destination address register   | DAR          | 24             |                  | DTC    | 16/32      | 2             |
| DTC transfer count register A      | CRA          | 16             |                  | DTC    | 16/32      | 2             |
| DTC transfer count register B      | CRB          | 16             |                  | DTC    | 16/32      | 2             |
| RAM module stop control register H | RMMSTPCRH    | 8              | H'FC80           | SYSTEM | 8          | 2             |
| RAM module stop control register L | RMMSTPCRL    | 8              | H'FC81           | SYSTEM | 8          | 2             |
| Interrupt priority register L      | IPRL         | 16             | H'FC90           | INT    | 16         | 2             |
| Interrupt priority register M      | IPRM         | 16             | H'FC92           | INT    | 16         | 2             |
| Interrupt priority register N      | IPRN         | 16             | H'FC94           | INT    | 16         | 2             |
| DTC enable register I              | DTCERI       | 8              | H'FC96           | DTC    | 16         | 2             |
| DTC control register               | DTCCR        | 8              | H'FC98           | DTC    | 16         | 2             |
| A/D data register A_1              | ADDRA_1      | 16             | H'FCA0           | A/D_1  | 16         | 2             |
| A/D data register B_1              | ADDRB_1      | 16             | H'FCA2           | A/D_1  | 16         | 2             |
| A/D data register C_1              | ADDRC_1      | 16             | H'FCA4           | A/D_1  | 16         | 2             |

- Notes: 1. If the pulse output group 2 and pulse output group 3 output triggers are the same according to the PCR setting, the NDRH address will be H'FF4C, and if different, the address of NDRH for group 2 will be H'FF4E, and that for group 3 will be H'FF4C. Similarly, if the pulse output group 0 and pulse output group 1 output triggers are the same according to the PCR setting, the NDRL address will be H'FF4D, and if different, the address of NDRL for group 0 will be H'FF4F, and that for group 1 will be H'FF4D.
2. For writing, see section 14.6.1, Notes on Register Access.
3. Not supported by the H8S/2424 Group.

## 24.2 Register Bits

Register addresses and bit names of the on-chip peripheral modules are described below.

Each line covers eight bits, and 16-bit and 32-bit registers are shown as 2 or 4 lines, respectively.

| Register     |        |        |        |        |        |        |        |        |                   |
|--------------|--------|--------|--------|--------|--------|--------|--------|--------|-------------------|
| Abbreviation | Bit 7  | Bit 6  | Bit 5  | Bit 4  | Bit 3  | Bit 2  | Bit 1  | Bit 0  | Module            |

- Notes:
1. Loaded in on-chip RAM. The bus width is 32 bits when the DTC accesses this area as register information, and 16 bits otherwise.
  2. For short address mode
  3. For full address mode
  4. For normal mode
  5. For smart card interface mode
  6. If the pulse output group 2 and pulse output group 3 output triggers are the same according to the PCR setting, the NDRH address will be H'FF4C, and if different, the address of NDRH for group 2 will be H'FF4E, and that for group 3 will be H'FF4C. Similarly, if the pulse output group 0 and pulse output group 1 output triggers are the same according to the PCR setting, the NDRL address will be H'FF4D, and if different, the address of NDRL for group 0 will be H'FF4F, and that for group 1 will be H'FF4D.
  7. Not supported by the H8S/2424 Group.

## 24.3 Register States in Each Operating Mode

Note: \* Not supported by the H8S/2424 Group.

## Section 25 Electrical Characteristics

### 25.1 Electrical Characteristics for H8S/2426 Group and H8S/2426R Group (3-V Version)

#### 25.1.1 Absolute Maximum Ratings

Table 25.1 lists the absolute maximum ratings.

**Table 25.1 Absolute Maximum Ratings**

| Item  | Symbol                   | Value                                     | Unit |
|---|--------------------------|---|------|
| Power supply voltage  | $V_{CC}$<br>$PLL V_{CC}$ | -0.3 to +4.3                              | V    |
| Input voltage (except ports 4, 9, and 2, P32 to P35, P50 and P51, and PJ0 to PJ2) | $V_{in}$                 | -0.3 to $V_{CC} + 0.3$                    | V    |
| Input voltage (ports 2, P50 and P51, P32 to P35, and PJ0 to PJ2)                  | $V_{in}$                 | -0.3 to +6.5                              | V    |
| Input voltage (ports 4 and 9)   | $V_{in}$                 | -0.3 to $AV_{CC} + 0.3$                   | V    |
| Reference power supply voltage  | $V_{ref}$                | -0.3 to $AV_{CC} + 0.3$                   | V    |
| Analog power supply voltage   | $AV_{CC}$                | -0.3 to +4.3                              | V    |
| Analog input voltage  | $V_{AN}$                 | -0.3 to $AV_{CC} + 0.3$                   | V    |
| Operating temperature   | $T_{opr}$                | Regular specifications:<br>-20 to +75*    | °C   |
|   |                          | Wide-range specifications:<br>-40 to +85* | °C   |
| Storage temperature   | $T_{stg}$                | -55 to +125                               | °C   |

Caution: Permanent damage to the LSI may result if absolute maximum ratings are exceeded.

Note: \* Ranges of operating temperature when flash memory is programmed/erased:

Regular specifications: 0 to +75°C

Wide-range specifications: 0 to +85°C

## 25.1.2 DC Characteristics

**Table 25.2 DC Characteristics (1)**

Conditions:  $V_{CC} = 3.0\text{ V to }3.6\text{ V}$ ,  $AV_{CC} = 3.0\text{ V to }3.6\text{ V}$ ,  $V_{ref} = 3.0\text{ V to }AV_{CC}$ ,  
 $V_{SS} = AV_{SS} = 0\text{ V}^{*1}$

| Item                          | Symbol  | Min.          | Typ.                 | Max. | Unit                 | Test Conditions |  |
|-------------------------------|---|---------------|----------------------|------|----------------------|-----------------|--|

|   | Idle  |                       | —    | 0.01           | 5.0                      | $\mu\text{A}$ | When channel 1 is in use                                       |
| Reference power supply current          | During A/D and D/A conversion                         | $AI_{CC}$             | —    | 0.5<br>(3.3 V) | 1.0                      | mA            |  |
|   | Idle  |                       | —    | 0.01           | 5.0                      | $\mu\text{A}$ |  |
| RAM standby voltage                     |   | $V_{RAM}$             | 2.5  | —              | —                        | V             |  |
| $V_{CC}$ start voltage <sup>*5</sup>    |   | $V_{CC\text{ start}}$ | —    | —              | 0.3                      | V             |  |
| $V_{CC}$ rising slope <sup>*5</sup>     |   | $SV_{CC}$             | —    | —              | 20                       | ms/V          |  |

Notes: 1. When the A/D and D/A converters are not used, the  $AV_{CC}$ ,  $V_{ref}$ , and  $AV_{SS}$  pins should not be open. Connect the  $AV_{CC}$  and  $V_{ref}$  pins to  $V_{CC}$ , and the  $AV_{SS}$  pin to  $V_{SS}$ .

2. Supply current values are for  $V_{IH\text{ min}} = V_{CC} - 0.2\text{ V}$  and  $V_{IL\text{ max}} = 0.2\text{ V}$  with all output pins unloaded and all input pull-up MOSs in the off state.

3. The values are for  $V_{RAM} \leq V_{CC} < 3.0 \text{ V}$ ,  $V_{IH\ min} = V_{CC} \times 0.9$ , and  $V_{IL\ max} = 0.3 \text{ V}$ .
4.  $I_{CC}$  depends on  $V_{CC}$  and  $f$  as follows:
  - $I_{CC\ max} = 5.2 \text{ (mA)} + 1.66 \text{ (mA/(MHz))} \times f$  (normal operation)
  - $I_{CC\ max} = 2.6 \text{ (mA)} + 1.28 \text{ (mA/(MHz))} \times f$  (sleep mode)
5. Applied when  $\overline{RES}$  is low at power-on.

#### Table 25.4 Permissible Output Currents

Conditions:  $V_{CC} = 3.0 \text{ V to } 3.6 \text{ V}$ ,  $AV_{CC} = 3.0 \text{ V to } 3.6 \text{ V}$ ,  $V_{ref} = 3.0 \text{ V to } AV_{CC}$ ,  
 $V_{SS} = AV_{SS} = 0 \text{ V}^*$

| Item                                      |  | Symbol           | Min. | Typ. | Max. | Unit |
|---|--|------------------|------|------|------|------|
| Permissible output low current (per pin)  | All output pins except the I <sup>2</sup> C pins | $I_{OL}$         | —    | —    | 4.0  | mA   |
|   | I <sup>2</sup> C output pins                     | $I_{OL}$         | —    | —    | 8.0  | mA   |
| Permissible output low current (total)    | Total of all output pins                         | $\Sigma I_{OL}$  | —    | —    | 80   | mA   |
| Permissible output high current (per pin) | All output pins                                  | $-I_{OH}$        | —    | —    | 2.0  | mA   |
| Permissible output high current (total)   | Total of all output pins                         | $\Sigma -I_{OH}$ | —    | —    | 40   | mA   |

Caution: To protect the LSI's reliability, do not exceed the output current values in table 25.4.

Note: \* When the A/D and D/A converters are not used, do not leave the  $AV_{CC}$ ,  $V_{ref}$ , and  $AV_{SS}$  pins open. Connect the  $AV_{CC}$  and  $V_{ref}$  pins to  $V_{CC}$ , and the  $AV_{SS}$  pin to  $V_{SS}$ .

### 25.1.3 AC Characteristics

The following shows the timings of the clock, control signals, bus, DMAC, EXDMAC, and on-chip peripheral functions.

#### (1) Clock Timing

**Table 25.5 Clock Timing**

Conditions:  $V_{CC} = 3.0\text{ V to }3.6\text{ V}$ ,  $AV_{CC} = 3.0\text{ V to }3.6\text{ V}$ ,  $V_{ref} = 3.0\text{ V to }AV_{CC}$ ,  $V_{SS} = AV_{SS} = 0\text{ V}$ ,  $\phi = 8\text{ MHz to }33\text{ MHz}$

| Item   | Symbol     | Min.                     | Max.                     | Unit | Test Conditions |
|--|------------|--------------------------|--------------------------|------|-----------------|

|   |             |                 | Data flash area | 2                   | —    | —    |               |

- Notes:
1. When programming is to be performed multiple times on a system, reduce the effective number of programming operations by shifting the writing addresses in sequence and so on until the remaining blank area is as small as possible and only then erasing the entire block once. For example, if sets of 16 bytes are being programmed, erasing the block once after programming the maximum number of sets (256) minimizes the effective number of programming operations. We recommend keeping information on the number of times erasure is performed for each block, and setting up the limit on the number of times.
  2. If an erase error occurs during erasure, execute the clear status command and then the erase command at least 3 times until the erase does not recur.
- \*1. Determination of the number of times for programming/erasure operations.
- Number of times programming/erasure is performed in each block.
- When the number of times for programming/erasure operations is  $n$  ( $n = 100$ ), data can be erased  $n$  times in each block.
- For example, if programming of 4 bytes is done 1024 times, each at a different address in a 4-kbyte per block, and the block is then erased, this counts as programming/erasure one time. However, programming of any location in a block multiple times is not possible (overwriting is prohibited).
- \*2. This is the number of times for which all electrical characteristics are guaranteed.

## 25.2 Electrical Characteristics for H8S/2424 Group (3-V Version)

### 25.2.1 Absolute Maximum Ratings

Table 25.14 lists the absolute maximum ratings.

**Table 25.14 Absolute Maximum Ratings**

| Item   | Symbol                   | Value   | Unit |
|--|--------------------------|---|------|
| Power supply voltage   | $V_{CC}$<br>$PLL V_{CC}$ | -0.3 to +4.3  | V    |
| Input voltage (except ports 4, 9, and 2, P32 to P35, P50 and P51, and P81 and P83) | $V_{in}$                 | -0.3 to $V_{CC} + 0.3$  | V    |
| Input voltage (port 2, P50 and P51, P32 to P35, and P81 and P83)                   | $V_{in}$                 | -0.3 to +6.5  | V    |
| Input voltage (ports 4 and 9)  | $V_{in}$                 | -0.3 to $AV_{CC} + 0.3$   | V    |
| Reference power supply voltage   | $V_{ref}$                | -0.3 to $AV_{CC} + 0.3$   | V    |
| Analog power supply voltage  | $AV_{CC}$                | -0.3 to +4.3  | V    |
| Analog input voltage   | $V_{AN}$                 | -0.3 to $AV_{CC} + 0.3$   | V    |
| Operating temperature  | $T_{opr}$                | Regular specifications:<br>-20 to +75*<br>Wide-range specifications:<br>-40 to +85* | °C   |
| Storage temperature  | $T_{stg}$                | -55 to +125   | °C   |

Caution: Permanent damage to the LSI may result if absolute maximum ratings are exceeded.

Note: \* Ranges of operating temperature when flash memory is programmed/erased:

Regular specifications: 0 to +75°C

Wide-range specifications: 0 to +85°C

## 25.2.2 DC Characteristics

**Table 25.15 DC Characteristics (1)**

Conditions:  $V_{CC} = 3.0\text{ V to }3.6\text{ V}$ ,  $AV_{CC} = 3.0\text{ V to }3.6\text{ V}$ ,  $V_{ref} = 3.0\text{ V to }AV_{CC}$ ,  
 $V_{SS} = AV_{SS} = 0\text{ V}^{*1}$

| Item                          | Symbol   | Min.          | Typ.                 | Max.            | Unit                 | Test Conditions |  |

Notes: Pins of port 2, P32 to P35, P50 and P51, and P81 and P83 are 5-V tolerant.

1. When the A/D and D/A converters are not used, the  $AV_{CC}$ ,  $V_{ref}$ , and  $AV_{SS}$  pins should not be open. Connect the  $AV_{CC}$  and  $V_{ref}$  pins to  $V_{CC}$ , and the  $AV_{SS}$  pin to  $V_{SS}$ .
2. When used as  $\overline{IRQ}$ , TIOC, TCLK, TMRI, SCL, or SDA.
3. When used as other than  $\overline{IRQ}$ , TIOC, TCLK, TMRI, SCL, or SDA.
4. When used as SCL or SDA.
5. When used as SSO, SSI, SSCK, or  $\overline{SCS}$ .
6. When used as RxD,  $\overline{WAIT}$ , or  $\overline{ADTRG1}$ .

**Table 25.16 DC Characteristics (2)**

Conditions:  $V_{CC} = 3.0\text{ V to }3.6\text{ V}$ ,  $AV_{CC} = 3.0\text{ V to }3.6\text{ V}$ ,  $V_{ref} = 3.0\text{ V to }AV_{CC}$ ,  
 $V_{SS} = AV_{SS} = 0\text{ V}^{*1}$

| $V_{CC}$ rising slope <sup>*5</sup>     |   | $SV_{CC}$             | —    | —              | 20   | ms/V          |  |

Notes: 1. When the A/D and D/A converters are not used, the  $AV_{CC}$ ,  $V_{ref}$ , and  $AV_{SS}$  pins should not be open. Connect the  $AV_{CC}$  and  $V_{ref}$  pins to  $V_{CC}$ , and the  $AV_{SS}$  pin to  $V_{SS}$ .

2. Supply current values are for  $V_{IH\text{ min}} = V_{CC} - 0.2\text{ V}$  and  $V_{IL\text{ max}} = 0.2\text{ V}$  with all output pins unloaded and all input pull-up MOSs in the off state.

3. The values are for  $V_{RAM} \leq V_{CC} < 3.0 \text{ V}$ ,  $V_{IH \text{ min}} = V_{CC} \times 0.9$ , and  $V_{IL \text{ max}} = 0.3 \text{ V}$ .
4.  $I_{CC}$  depends on  $V_{CC}$  and  $f$  as follows:  
 $I_{CC \text{ max}} = 5.2 \text{ (mA)} + 1.66 \text{ (mA/(MHz))} \times f$  (normal operation)  
 $I_{CC \text{ max}} = 2.6 \text{ (mA)} + 1.28 \text{ (mA/(MHz))} \times f$  (sleep mode)
5. Applied when  $\overline{\text{RES}}$  is low at power-on.

**Table 25.17 Permissible Output Currents**

Conditions:  $V_{CC} = 3.0 \text{ V to } 3.6 \text{ V}$ ,  $AV_{CC} = 3.0 \text{ V to } 3.6 \text{ V}$ ,  $V_{ref} = 3.0 \text{ V to } AV_{CC}$ ,  
 $V_{SS} = AV_{SS} = 0 \text{ V}^*$

| Item                                      |  | Symbol           | Min. | Typ. | Max. | Unit |
|---|--|------------------|------|------|------|------|
| Permissible output low current (per pin)  | All output pins except the I <sup>2</sup> C pins | $I_{OL}$         | —    | —    | 4.0  | mA   |
|   | I <sup>2</sup> C output pins                     | $I_{OL}$         | —    | —    | 8.0  | mA   |
| Permissible output low current (total)    | Total of all output pins                         | $\Sigma I_{OL}$  | —    | —    | 80   | mA   |
| Permissible output high current (per pin) | All output pins                                  | $-I_{OH}$        | —    | —    | 2.0  | mA   |
| Permissible output high current (total)   | Total of all output pins                         | $\Sigma -I_{OH}$ | —    | —    | 40   | mA   |

Caution: To protect the LSI's reliability, do not exceed the output current values in table 25.29.

Note: \* When the A/D and D/A converters are not used, do not leave the  $AV_{CC}$ ,  $V_{ref}$ , and  $AV_{SS}$  pins open. Connect the  $AV_{CC}$  and  $V_{ref}$  pins to  $V_{CC}$ , and the  $AV_{SS}$  pin to  $V_{SS}$ .

### 25.2.3 AC Characteristics

The following shows the timings of the clock, control signals, bus, DMAC, and on-chip peripheral functions.

#### (1) Clock Timing

**Table 25.18 Clock Timing**

Conditions:  $V_{CC} = 3.0\text{ V to }3.6\text{ V}$ ,  $AV_{CC} = 3.0\text{ V to }3.6\text{ V}$ ,  $V_{ref} = 3.0\text{ V to }AV_{CC}$ ,  $V_{SS} = AV_{SS} = 0\text{ V}$ ,  
 $\phi = 8\text{ MHz to }33\text{ MHz}$

| Item   | Symbol     | Min. | Max. | Unit | Test Conditions |
|--|------------|------|------|------|-----------------|
| Clock cycle time                                     | $t_{cyc}$  | 30.3 | 125  | ns   | Figure 25.3     |
| Clock pulse high width                               | $t_{CH}$   | 10   | —    | ns   | Figure 25.3     |
| Clock pulse low width                                | $t_{CL}$   | 10   | —    | ns   |                 |
| Clock rising time                                    | $t_{Cr}$   | —    | 5    | ns   |                 |
| Clock falling time                                   | $t_{Cf}$   | —    | 5    | ns   |                 |
| Reset oscillation settling time (crystal)            | $t_{OSC1}$ | 15   | —    | ms   | Figure 25.5(1)  |
| Software standby oscillation settling time (crystal) | $t_{OSC2}$ | 5    | —    | ms   | Figure 25.5(2)  |
| External clock output delay settling time            | $t_{DEXT}$ | 15   | —    | ms   | Figure 25.5(1)  |

**(3) Bus Timing****Table 25.20 Bus Timing (1)**

Conditions:  $V_{CC} = 3.0\text{ V to }3.6\text{ V}$ ,  $AV_{CC} = 3.0\text{ V to }3.6\text{ V}$ ,  $V_{ref} = 3.0\text{ V to }AV_{CC}$ ,  $V_{SS} = AV_{SS} = 0\text{ V}$ ,  
 $\phi = 8\text{ MHz to }33\text{ MHz}$

| Item                                    | Symbol     | Min.                      | Max.                      | Unit | Test Conditions                              |
|---|------------|---------------------------|---------------------------|------|--|

|   |        |                 | Data flash area | 2                   | —    | —    |               |

Notes: 1. In the system where multiple programming are executed, erase once so as to effectively diminish the programming times after having written with leaving the blank area as least as possible by shifting writing address one by one.

For example, if 16 bytes per 1 set is being programmed, erase once after maximum 256 sets of programming has been done, which diminish the effective programming times.

Keep the information of the times of erasure and set up the limitation times is recommended.

2. If an erase error is occurred, execute the clear status command -> erase command for at least 3 times until no erase error is occurred.

\*1. Determination of the number of times the programming/erase operation.

Number of times the programming/erase performed in each block.

When the number of times the programming/erase is n times (n = 100), data can be erased n times in each block.

For example, if 4 bytes programming is done 1024 times, each at a different address in a 4-kbyte per block, and then the block is erased, number of times the programming/erase can be one time.

However, programming cannot be done multiple times in the block (overwriting is prohibited).

\*2. Number of times that ensures all the electrical characteristics.

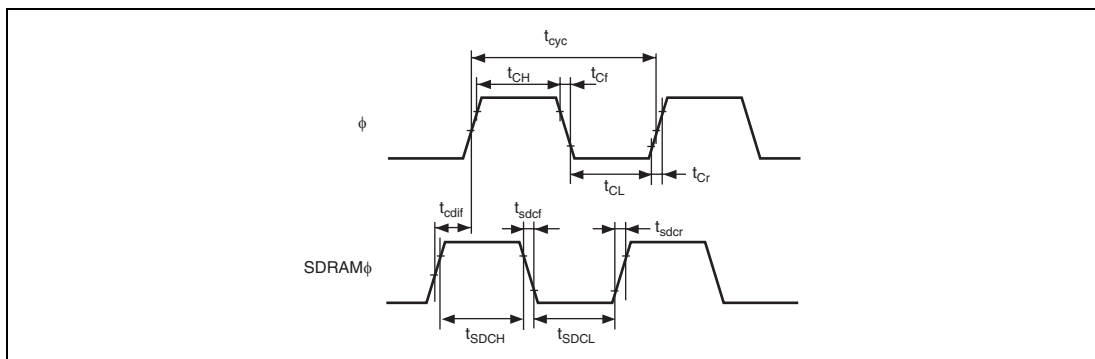

## 25.3 Timing Charts (3-V Version)

### 25.3.1 Clock Timing

The clock timings are shown below.

**Figure 25.3 System Clock Timing**

**Figure 25.4 SDRAM  $\phi$  Timing**

**Figure 25.5 (1) Oscillation Settling Timing**

**Figure 25.5 (2) Oscillation Settling Timing**

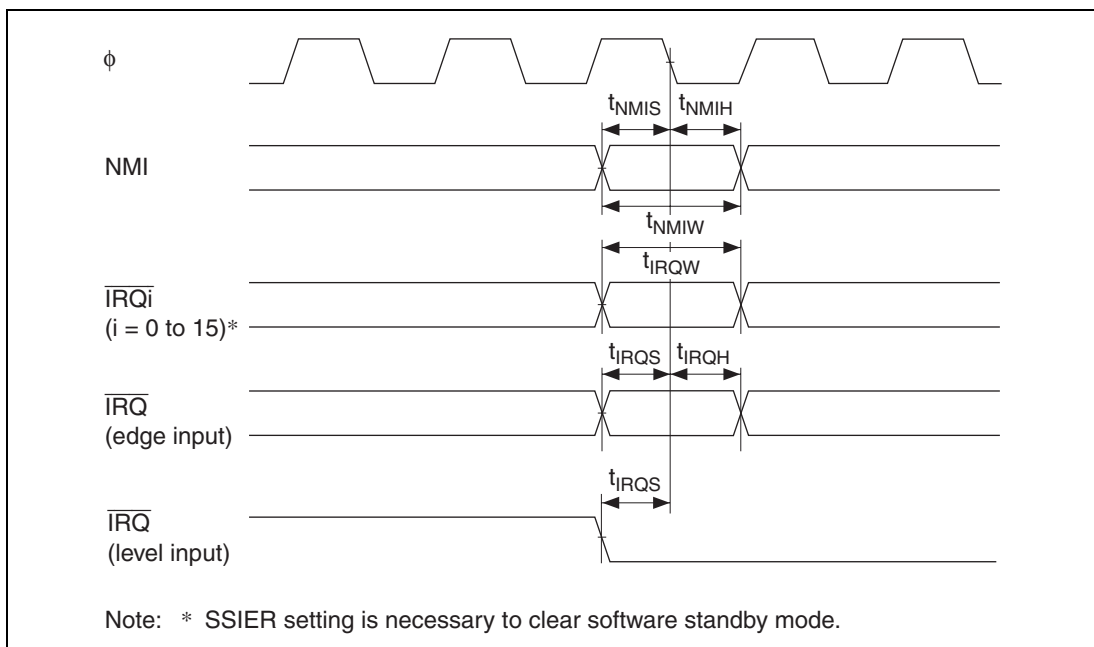

### 25.3.2 Control Signal Timing

The control signal timings are shown below.

**Figure 25.6 Reset Input Timing**

**Figure 25.7 Interrupt Input Timing**

### 25.3.3 Bus Timing

The bus timings are shown below.

Figure 25.8 Basic Bus Timing: Two-State Access

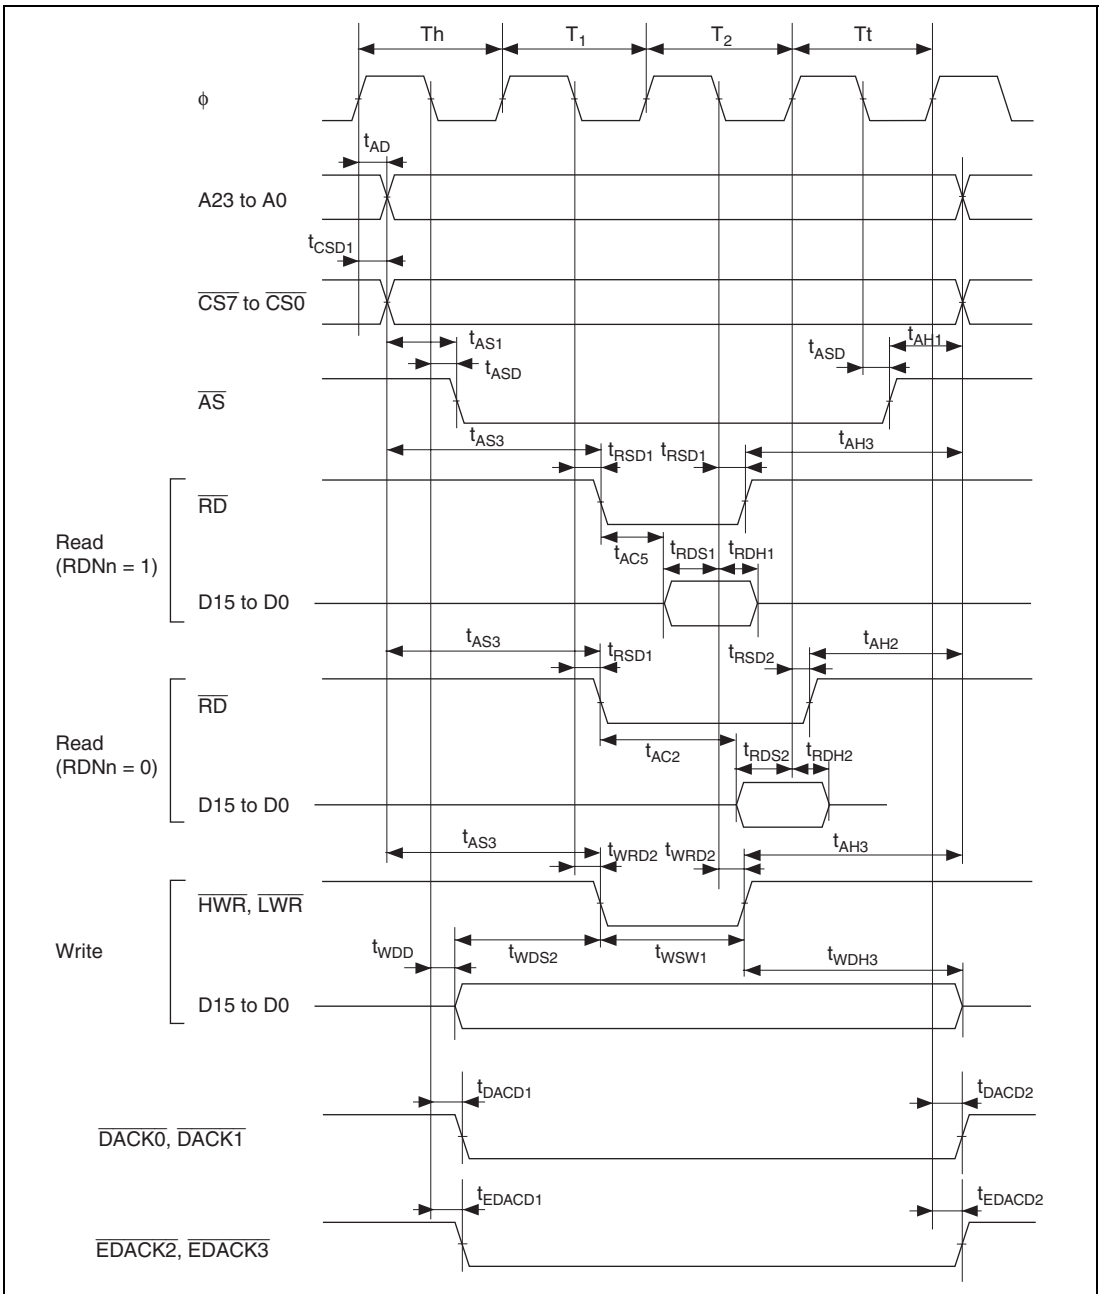

Figure 25.9 Basic Bus Timing: Three-State Access

**Figure 25.10 Basic Bus Timing: Three-State Access, One Wait**

**Figure 25.11 Basic Bus Timing: Two-State Access ( $\overline{CS}$  Assertion Period Extended)**

## 25.4 Electrical Characteristics for H8S/2426 Group (5-V Version)

### 25.4.1 Absolute Maximum Ratings

Table 25.26 lists the absolute maximum ratings.

**Table 25.26 Absolute Maximum Ratings**

| Item  | Symbol                   | Value                                     | Unit |
|---|--------------------------|---|------|
| Power supply voltage  | $V_{CC}$<br>$PLL V_{CC}$ | -0.3 to +6.5                              | V    |
| Input voltage (except ports 4, 9, and 2, P32 to P35, P50 and P51, and PJ0 to PJ2) | $V_{in}$                 | -0.3 to $V_{CC} + 0.3$                    | V    |
| Input voltage (ports 2, P50 and P51, P32 to P35, and PJ0 to PJ2)                  | $V_{in}$                 | -0.3 to +6.5                              | V    |
| Input voltage (ports 4 and 9)   | $V_{in}$                 | -0.3 to $AV_{CC} + 0.3$                   | V    |
| Reference power supply voltage  | $V_{ref}$                | -0.3 to $AV_{CC} + 0.3$                   | V    |
| Analog power supply voltage   | $AV_{CC}$                | -0.3 to +6.5                              | V    |
| Analog input voltage  | $V_{AN}$                 | -0.3 to $AV_{CC} + 0.3$                   | V    |
| Operating temperature   | $T_{opr}$                | Regular specifications:<br>-20 to +75*    | °C   |
|   |                          | Wide-range specifications:<br>-40 to +85* | °C   |
| Storage temperature   | $T_{stg}$                | -55 to +125                               | °C   |

Caution: Permanent damage to the LSI may result if absolute maximum ratings are exceeded.

Note: \* Ranges of operating temperature when flash memory is programmed/erased:

Regular specifications: 0 to +75°C

Wide-range specifications: 0 to +85°C

## 25.4.2 DC Characteristics

**Table 25.27 DC Characteristics (1)**

Conditions:  $V_{CC} = 4.5\text{ V to }5.5\text{ V}$ ,  $AV_{CC} = 4.5\text{ V to }5.5\text{ V}$ ,  $V_{ref} = 4.5\text{ V to }AV_{CC}$ ,  
 $V_{SS} = AV_{SS} = 0\text{ V}^{*1}$

| Item                          | Symbol  | Min.          | Typ.                 | Max. | Unit                 | Test Conditions |  |

|   | Idle  |                       | —    | 0.01           | 5.0                      | $\mu\text{A}$ | When channel 1 is in use   |
| Reference power supply current          | During A/D and D/A conversion                         | $AI_{CC}$             | —    | 0.5<br>(5.0 V) | 1.0                      | mA            |  |
|   | Idle  |                       | —    | 0.01           | 5.0                      | $\mu\text{A}$ |  |
| RAM standby voltage                     |   | $V_{RAM}$             | 2.5  | —              | —                        | V             |  |
| $V_{CC}$ start voltage <sup>*5</sup>    |   | $V_{CC\text{ start}}$ | —    | —              | 0.3                      | V             |  |
| $V_{CC}$ rising slope <sup>*5</sup>     |   | $SV_{CC}$             | —    | —              | 20                       | ms/V          |  |

Notes: 1. When the A/D and D/A converters are not used, the  $AV_{CC}$ ,  $V_{ref}$ , and  $AV_{SS}$  pins should not be open. Connect the  $AV_{CC}$  and  $V_{ref}$  pins to  $V_{CC}$ , and the  $AV_{SS}$  pin to  $V_{SS}$ .

2. Supply current values are for  $V_{IH\text{ min}} = V_{CC} - 0.2 \text{ V}$  and  $V_{IL\text{ max}} = 0.2 \text{ V}$  with all output pins unloaded and all input pull-up MOSs in the off state.

3. The values are for  $V_{RAM} \leq V_{CC} < 4.5 \text{ V}$ ,  $V_{IH\ min} = V_{CC} \times 0.9$ , and  $V_{IL\ max} = 0.3 \text{ V}$ .
4.  $I_{CC}$  depends on  $V_{CC}$  and  $f$  as follows:
  - $I_{CC\ max} = 5.2 \text{ (mA)} + 1.96 \text{ (mA/(MHz))} \times f$  (normal operation)
  - $I_{CC\ max} = 2.6 \text{ (mA)} + 1.28 \text{ (mA/(MHz))} \times f$  (sleep mode)
5. Applied when  $\overline{RES}$  is low at power-on.

### Table 25.29 Permissible Output Currents

Conditions:  $V_{CC} = 4.5 \text{ V to } 5.5 \text{ V}$ ,  $AV_{CC} = 4.5 \text{ V to } 5.5 \text{ V}$ ,  $V_{ref} = 4.5 \text{ V to } AV_{CC}$ ,  
 $V_{SS} = AV_{SS} = 0 \text{ V}^*$

| Item                                      |  | Symbol           | Min. | Typ. | Max. | Unit |
|---|--|------------------|------|------|------|------|
| Permissible output low current (per pin)  | All output pins except the I <sup>2</sup> C pins | $I_{OL}$         | —    | —    | 4.0  | mA   |
|   | I <sup>2</sup> C output pins                     | $I_{OL}$         | —    | —    | 8.0  | mA   |
| Permissible output low current (total)    | Total of all output pins                         | $\Sigma I_{OL}$  | —    | —    | 80   | mA   |
| Permissible output high current (per pin) | All output pins                                  | $-I_{OH}$        | —    | —    | 2.0  | mA   |
| Permissible output high current (total)   | Total of all output pins                         | $\Sigma -I_{OH}$ | —    | —    | 40   | mA   |

Caution: To protect the LSI's reliability, do not exceed the output current values in table 25.29.

Note: \* When the A/D and D/A converters are not used, do not leave the  $AV_{CC}$ ,  $V_{ref}$ , and  $AV_{SS}$  pins open. Connect the  $AV_{CC}$  and  $V_{ref}$  pins to  $V_{CC}$ , and the  $AV_{SS}$  pin to  $V_{SS}$ .

### 25.4.3 AC Characteristics

The following shows the timings of the clock, control signals, bus, DMAC, EXDMAC, and on-chip peripheral functions.

#### (1) Clock Timing

**Table 25.30 Clock Timing**

Conditions:  $V_{CC} = 4.5 \text{ V to } 5.5 \text{ V}$ ,  $AV_{CC} = 4.5 \text{ V to } 5.5 \text{ V}$ ,  $V_{ref} = 4.5 \text{ V to } AV_{CC}$ ,  $V_{SS} = AV_{SS} = 0 \text{ V}$ ,  
 $\phi = 8 \text{ MHz to } 33 \text{ MHz}$

| Item   | Symbol     | Min. | Max. | Unit | Test Conditions |
|--|------------|------|------|------|-----------------|
| Clock cycle time                                     | $t_{cyc}$  | 30.3 | 125  | ns   | Figure 25.54    |
| Clock pulse high width                               | $t_{CH}$   | 10   | —    | ns   |                 |
| Clock pulse low width                                | $t_{CL}$   | 10   | —    | ns   |                 |
| Clock rising time                                    | $t_{Cr}$   | —    | 5    | ns   |                 |
| Clock falling time                                   | $t_{Cf}$   | —    | 5    | ns   |                 |
| Reset oscillation settling time (crystal)            | $t_{OSC1}$ | 15   | —    | ms   | Figure 25.55(1) |
| Software standby oscillation settling time (crystal) | $t_{OSC2}$ | 5    | —    | ms   | Figure 25.55(2) |
| External clock output delay settling time            | $t_{DEXT}$ | 15   | —    | ms   | Figure 25.55(1) |

**(3) Bus Timing****Table 25.32 Bus Timing (1)**

Conditions:  $V_{CC} = 4.5\text{ V to }5.5\text{ V}$ ,  $AV_{CC} = 4.5\text{ V to }5.5\text{ V}$ ,  $V_{ref} = 4.5\text{ V to }AV_{CC}$ ,  $V_{SS} = AV_{SS} = 0\text{ V}$ ,  
 $\phi = 8\text{ MHz to }33\text{ MHz}$

| Item                         | Symbol     | Min.                      | Max.                      | Unit | Test Conditions        |

| Access state                              |             |                 | User ROM        | 1                   | —    | —    | State         |
|   |             |                 | Data flash area | 2                   | —    | —    |               |

- Notes:
1. When programming is to be performed multiple times on a system, reduce the effective number of programming operations by shifting the writing addresses in sequence and so on until the remaining blank area is as small as possible and only then erasing the entire block once. For example, if sets of 16 bytes are being programmed, erasing the block once after programming the maximum number of sets (256) minimizes the effective number of programming operations. We recommend keeping information on the number of times erasure is performed for each block, and setting up the limit on the number of times.
  2. If an erase error occurs during erasure, execute the clear status command and then the erase command at least 3 times until the erase does not recur.
- \*1. Determination of the number of times for programming/erasure operations.
- Number of times programming/erasure is performed in each block.
- When the number of times for programming/erasure operations is  $n$  ( $n = 100$ ), data can be erased  $n$  times in each block.
- For example, if programming of 4 bytes is done 1024 times, each at a different address in a 4-kbyte per block, and the block is then erased, this counts as programming/erasure one time. However, programming of any location in a block multiple times is not possible (overwriting is prohibited).
- \*2. This is the number of times for which all electrical characteristics are guaranteed.

## 25.5 Electrical Characteristics for H8S/2424 Group (5-V Version)

### 25.5.1 Absolute Maximum Ratings

Table 25.39 lists the absolute maximum ratings.

**Table 25.39 Absolute Maximum Ratings**

| Item   | Symbol                   | Value   | Unit |
|--|--------------------------|---|------|
| Power supply voltage   | $V_{CC}$<br>$PLL V_{CC}$ | -0.3 to +6.5  | V    |
| Input voltage (except ports 4, 9, and 2, P32 to P35, P50 and P51, and P81 and P83) | $V_{in}$                 | -0.3 to $V_{CC} + 0.3$  | V    |
| Input voltage (port 2, P50 and P51, P32 to P35, and P81 and P83)                   | $V_{in}$                 | -0.3 to +6.5  | V    |
| Input voltage (ports 4 and 9)  | $V_{in}$                 | -0.3 to $AV_{CC} + 0.3$   | V    |
| Reference power supply voltage   | $V_{ref}$                | -0.3 to $AV_{CC} + 0.3$   | V    |
| Analog power supply voltage  | $AV_{CC}$                | -0.3 to +6.5  | V    |
| Analog input voltage   | $V_{AN}$                 | -0.3 to $AV_{CC} + 0.3$   | V    |
| Operating temperature  | $T_{opr}$                | Regular specifications:<br>-20 to +75*<br><br>Wide-range specifications:<br>-40 to +85* | °C   |
| Storage temperature  | $T_{stg}$                | -55 to +125   | °C   |

Caution: Permanent damage to the LSI may result if absolute maximum ratings are exceeded.

Note: \* Ranges of operating temperature when flash memory is programmed/erased:

Regular specifications: 0 to +75°C

Wide-range specifications: 0 to +85°C

## 25.5.2 DC Characteristics

**Table 25.40 DC Characteristics (1)**

Conditions:  $V_{CC} = 4.5 \text{ V to } 5.5 \text{ V}$ ,  $AV_{CC} = 4.5 \text{ V to } 5.5 \text{ V}$ ,  $V_{ref} = 4.5 \text{ V to } AV_{CC}$ ,  
 $V_{SS} = AV_{SS} = 0 \text{ V}^{*1}$

| Item                          | Symbol   | Min.                | Typ.                 | Max.            | Unit                 | Test Conditions |  |

|   | Idling   |                       | —    | 0.01           | 5.0           | $\mu\text{A}$            | When channel 1 is in use   |
| Reference power supply current          | During A/D and D/A conversion                  | $AI_{CC}$             | —    | 0.5<br>(5.0 V) | 1.0           | mA                       |  |
|   | Idling   |                       | —    | 0.01           | 5.0           | $\mu\text{A}$            |  |
| RAM standby voltage                     |  | $V_{RAM}$             | 2.5  | —              | —             | V                        |  |
| $V_{CC}$ start voltage <sup>*5</sup>    |  | $V_{CC\text{ start}}$ | —    | —              | 0.3           | V                        |  |
| $V_{CC}$ rising slope <sup>*5</sup>     |  | $SV_{CC}$             | —    | —              | 20            | ms/V                     |  |

Notes: 1. When the A/D and D/A converters are not used, the  $AV_{CC}$ ,  $V_{ref}$ , and  $AV_{SS}$  pins should not be open. Connect the  $AV_{CC}$  and  $V_{ref}$  pins to  $V_{CC}$ , and the  $AV_{SS}$  pin to  $V_{SS}$ .

2. Supply current values are for  $V_{IH\text{ min}} = V_{CC} - 0.2 \text{ V}$  and  $V_{IL\text{ max}} = 0.2 \text{ V}$  with all output pins unloaded and all input pull-up MOSs in the off state.

3. The values are for  $V_{\text{RAM}} \leq V_{\text{CC}} < 4.5 \text{ V}$ ,  $V_{\text{IH min}} = V_{\text{CC}} \times 0.9$ , and  $V_{\text{IL max}} = 0.3 \text{ V}$ .
4.  $I_{\text{CC}}$  depends on  $V_{\text{CC}}$  and  $f$  as follows:
  - $I_{\text{CC max}} = 5.2 \text{ (mA)} + 1.96 \text{ (mA/(MHz))} \times f$  (normal operation)
  - $I_{\text{CC max}} = 2.6 \text{ (mA)} + 1.28 \text{ (mA/(MHz))} \times f$  (sleep mode)
5. Applied when  $\overline{\text{RES}}$  is low at power-on.

### Table 25.42 Permissible Output Currents

Conditions:  $V_{\text{CC}} = 4.5 \text{ V to } 5.5 \text{ V}$ ,  $AV_{\text{CC}} = 4.5 \text{ V to } 5.5 \text{ V}$ ,  $V_{\text{ref}} = 4.5 \text{ V to } AV_{\text{CC}}$ ,  
 $V_{\text{SS}} = AV_{\text{SS}} = 0 \text{ V}^*$

| Item                                      |  | Symbol                  | Min. | Typ. | Max. | Unit |
|---|--|-------------------------|------|------|------|------|
| Permissible output low current (per pin)  | All output pins except the I <sup>2</sup> C pins | $I_{\text{OL}}$         | —    | —    | 4.0  | mA   |
|   | I <sup>2</sup> C output pins                     | $I_{\text{OL}}$         | —    | —    | 8.0  | mA   |
| Permissible output low current (total)    | Total of all output pins                         | $\Sigma I_{\text{OL}}$  | —    | —    | 80   | mA   |
| Permissible output high current (per pin) | All output pins                                  | $-I_{\text{OH}}$        | —    | —    | 2.0  | mA   |
| Permissible output high current (total)   | Total of all output pins                         | $\Sigma -I_{\text{OH}}$ | —    | —    | 40   | mA   |

Caution: To protect the LSI's reliability, do not exceed the output current values in table 25.29.

Note: \* When the A/D and D/A converters are not used, do not leave the  $AV_{\text{CC}}$ ,  $V_{\text{ref}}$ , and  $AV_{\text{SS}}$  pins open. Connect the  $AV_{\text{CC}}$  and  $V_{\text{ref}}$  pins to  $V_{\text{CC}}$ , and the  $AV_{\text{SS}}$  pin to  $V_{\text{SS}}$ .

### 25.5.3 AC Characteristics

The following shows the timings of the clock, control signals, bus, DMAC, and on-chip peripheral functions.

#### (1) Clock Timing

**Table 25.43 Clock Timing**

Conditions:  $V_{CC} = 4.5\text{ V to }5.5\text{ V}$ ,  $AV_{CC} = 4.5\text{ V to }5.5\text{ V}$ ,  $V_{ref} = 4.5\text{ V to }AV_{CC}$ ,  $V_{SS} = AV_{SS} = 0\text{ V}$ ,  
 $\phi = 8\text{ MHz to }33\text{ MHz}$

| Item   | Symbol     | Min. | Max. | Unit | Test Conditions |
|--|------------|------|------|------|-----------------|
| Clock cycle time                                     | $t_{cyc}$  | 30.3 | 125  | ns   | Figure 25.54    |
| Clock pulse high width                               | $t_{CH}$   | 10   | —    | ns   | Figure 25.54    |
| Clock pulse low width                                | $t_{CL}$   | 10   | —    | ns   |                 |
| Clock rising time                                    | $t_{Cr}$   | —    | 5    | ns   |                 |
| Clock falling time                                   | $t_{Cf}$   | —    | 5    | ns   |                 |
| Reset oscillation settling time (crystal)            | $t_{OSC1}$ | 15   | —    | ms   | Figure 25.55(1) |
| Software standby oscillation settling time (crystal) | $t_{OSC2}$ | 5    | —    | ms   | Figure 25.55(2) |
| External clock output delay settling time            | $t_{DEXT}$ | 15   | —    | ms   | Figure 25.55(1) |

|   |             |                 | Data flash area | 2                   | —    | —    |               |

Notes: 1. In the system where multiple programming are executed, erase once so as to effectively diminish the programming times after having written with leaving the blank area as least as possible by shifting writing address one by one.

For example, if 16 bytes per 1 set is being programmed, erase once after maximum 256 sets of programming has been done, which diminish the effective programming times.

Keep the information of the times of erasure and set up the limitation times is recommended.

2. If an erase error is occurred, execute the clear status command -> erase command for at least 3 times until no erase error is occurred.

\*1. Determination of the number of times the programming/erase operation.

Number of times the programming/erase performed in each block.

When the number of times the programming/erase is n times ( $n = 100$ ), data can be erased n times in each block.

For example, if 4 bytes programming is done 1024 times, each at a different address in a 4-kbyte per block, and then the block is erased, number of times the programming/erase can be one time.

However, programming cannot be done multiple times in the block (overwriting is prohibited).

\*2. Number of times that ensures all the electrical characteristics.

## 25.6 Timing Charts (5-V Version)

### 25.6.1 Clock Timing

The clock timings are shown below.

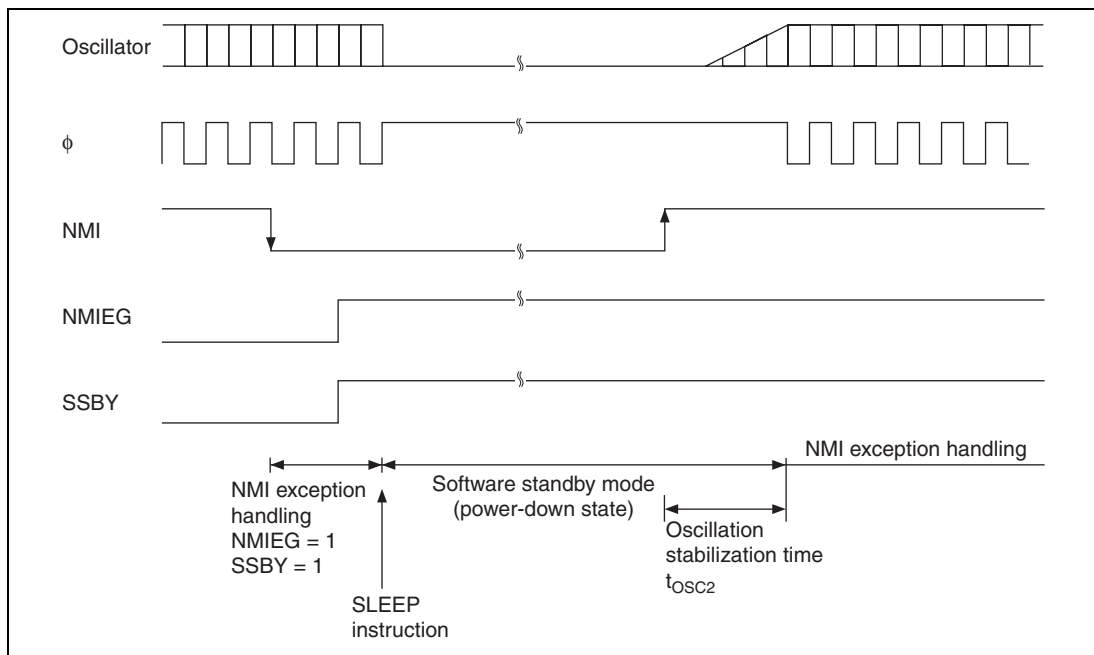

**Figure 25.54 System Clock Timing**

**Figure 25.55 (1) Oscillation Settling Timing**

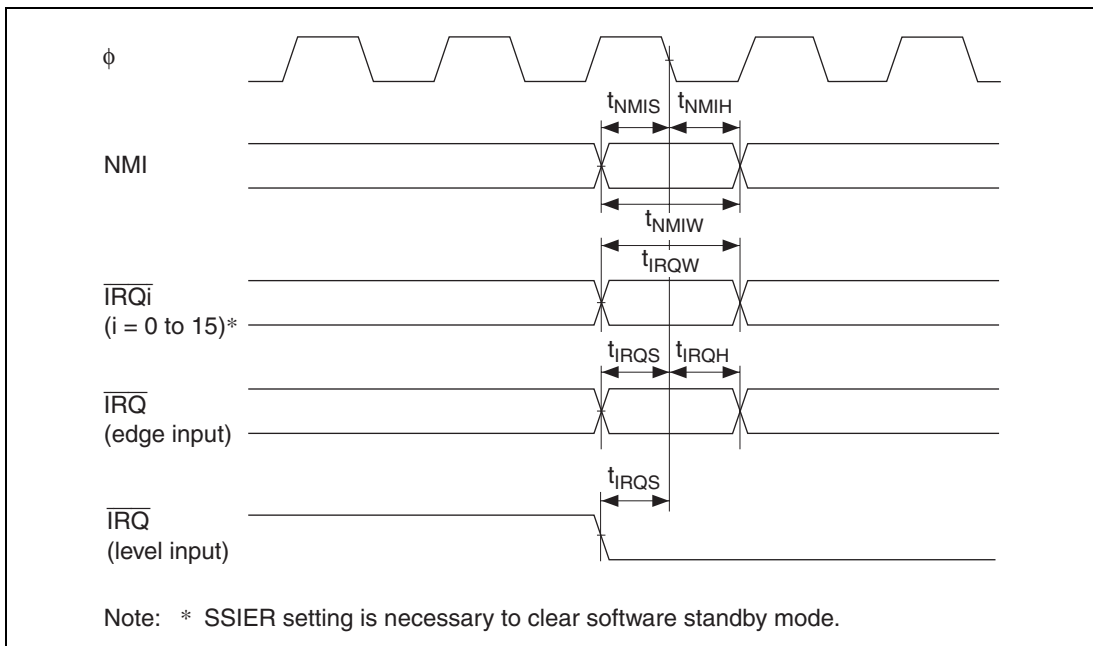

**Figure 25.55 (2) Oscillation Settling Timing**

## 25.6.2 Control Signal Timing

The control signal timings are shown below.

**Figure 25.56 Reset Input Timing**

**Figure 25.57 Interrupt Input Timing**

### 25.6.3 Bus Timing

The bus timings are shown below.

Figure 25.58 Basic Bus Timing: Two-State Access

## [Legend]

H: High-level

L: Low-level

Keep: Input ports become high-impedance, and output ports retain their state.

T: High-impedance

DDR: Data direction register

OPE: Output port enable

Notes: 1. Not supported in the H8S/2426 Group.

2. Not supported in the 5-V version.

3. Low output if a watchdog timer overflow occurs when  $WT/\overline{IT}$  is set to 1.

## [Legend]

H: High-level

L: Low-level

Keep: Input ports become high-impedance, and output ports retain their state.

T: High-impedance

DDR: Data direction register

OPE: Output port enable

Notes: 1. Not supported in the 5-V version.

2. Low output if a watchdog timer overflow occurs when  $\overline{WT}/\overline{IT}$  is set to 1.

**Figure B.4 Package Dimensions (PLQP0120KA-A)**

## C. Treatment of Unused Pins

The treatments of unused pins are listed in table C.1

**Table C.1 Treatment of Unused Pins**

| Pin Name            | Mode 1  | Mode 2 | Mode 4 | Mode 7 |
|---------------------|---|--------|--------|--------|
| RES                 | • Connect this pin to $V_{CC}$ via a pull-up resistor   |        |        |        |
| STBY                | • Connect this pin to $V_{CC}$ via a pull-up resistor   |        |        |        |
| EMLE                | • Connect this pin to $V_{SS}$ via a pull-down resistor   |        |        |        |
| MD2 to MD0          | (Always used as mode pins)  |        |        |        |
| NMI                 | • Connect this pin to $V_{CC}$ via a pull-up resistor   |        |        |        |
| EXTAL               | (Always used as a clock pin)  |        |        |        |
| XTAL                | • Leave this pin open   |        |        |        |
| $\overline{WDTOVF}$ | • Leave this pin open   |        |        |        |
| Port 1              | • Connect these pins to $V_{CC}$ via a pull-up resistor or to $V_{SS}$ via a pull-down resistor, respectively   |        |        |        |
| Port 2              |   |        |        |        |
| Port 3              |   |        |        |        |
| Port 5              |   |        |        |        |
| Port 8              |   |        |        |        |
| PA7 to PA5          |   |        |        |        |
| PF2 to PF0          |   |        |        |        |
| PG7 to PG1          |   |        |        |        |
| PH3, PH2,<br>PH0    |   |        |        |        |
| PJ2 to PJ0          | • Connect these pins to $AV_{CC}$ via a pull-up resistor or to $AV_{SS}$ via a pull-down resistor, respectively |        |        |        |
| Ports 4 and 9       |   |        |        |        |

| Pin Name                       | Mode 1  | Mode 2 | Mode 4 | Mode 7  |

(H8S/2426 and H8S/2424)</li> </ul> |        |        |   |

# Main Revisions and Additions in this Edition

## Changes in Rev. 3.50 Compared to Rev. 3.00

| <b>Item</b>   | <b>Page</b>                            | <b>Revision (See Manual for Details)</b>        |
|---|--|---|
| Section 21 Flash Memory<br>21.10 Serial Communication<br>Interface Specification for<br>Boot Mode | 1122,                                  | (9) Programming/Erasing State                   |
|   | 1124                                   | Table 21.9 Programming/Erasing Commands amended |
|   |  | (a) User-Program Programming Selection amended  |
|   |  | (c) Programming End: Section title added        |
|   | 1126                                   | (10) Erasure                                    |
|   |  | (a) Erasure Selection amended                   |
|   | 1127                                   | (11) Memory Read added                          |
|   | 1128                                   | (12) User ROM Sum Check added                   |
|   | 1128                                   | (13) Data Flash Sum Check added                 |
|   | 1129                                   | (14) User ROM Blank Check added                 |
| 1129  | (15) Data Flash Blank Check added      |   |
| 1130  | (16) Boot Program Status Inquiry added |   |

# Index

## Numerics

|                                    |     |
|------------------------------------|-----|
| 16-Bit counter mode .....          | 844 |
| 16-Bit timer pulse unit (TPU)..... | 701 |
| 8-Bit timer (TMR) .....            | 827 |

## A

|                                      |             |
|--------------------------------------|-------------|
| A/D conversion accuracy.....         | 1018        |
| A/D converter .....                  | 991         |
| A/D converter activation.....        | 783         |
| Absolute accuracy.....               | 1018        |
| Absolute address.....                | 75          |
| Acknowledge.....                     | 7, 955, 972 |
| Activation by external request ..... | 347         |
| Activation by software.....          | 496, 500    |
| Address mode .....                   | 423         |
| Address space .....                  | 53          |
| Addressing modes.....                | 74          |
| Advanced mode .....                  | 51          |
| Arithmetic operations .....          | 65          |
| Asynchronous mode .....              | 900         |
| Auto request mode.....               | 427         |

## B

|  |               |
|--|---------------|
| Basic timing.....                      | 196           |
| Bcc.....                               | 62, 70        |
| Bit manipulation instructions.....     | 68            |
| Bit rate .....                         | 889           |
| Block data transfer instructions ..... | 72            |
| Block transfer mode.....               | 367, 431, 494 |
| Branch instructions .....              | 70            |
| Break.....                             | 948           |
| Buffer operation.....                  | 759           |
| Burst mode.....                        | 376, 429      |
| Burst ROM interface.....               | 281           |
| Bus arbitration .....                  | 309           |

|                           |     |
|---------------------------|-----|
| Bus controller (BSC)..... | 149 |
| Bus release .....         | 312 |

## C

|   |      |
|---|------|
| Cascaded connection.....                      | 844  |
| Cascaded operation .....                      | 763  |
| Chain transfer.....                           | 495  |
| Chain transfer when counter = 0 .....         | 503  |
| Clock pulse generator .....                   | 1133 |
| Clock synchronous communication<br>mode ..... | 1068 |
| Clocked synchronous mode .....                | 918  |
| CMI.....                                      | 129  |
| CMIA.....                                     | 845  |
| CMIA0.....                                    | 131  |
| CMIA1 .....                                   | 131  |
| CMIB .....                                    | 845  |
| CMIB0 .....                                   | 131  |
| CMIB1 .....                                   | 131  |
| Communications protocol.....                  | 1105 |
| Compare match count mode .....                | 844  |
| Condition field .....                         | 72   |
| Condition-code register (CCR) .....           | 57   |
| CPU operating modes .....                     | 49   |
| Cycle steal mode.....                         | 428  |

## D

|                                     |     |
|-------------------------------------|-----|
| Data direction register.....        | 507 |
| Data register.....                  | 507 |
| Data size and data alignment .....  | 193 |
| Data transfer controller (DTC)..... | 475 |
| Data transfer instructions .....    | 64  |
| DMA controller (DMAC) .....         | 315 |
| DMTEND0A .....                      | 131 |
| DMTEND0B.....                       | 131 |

|                        |          |
|------------------------|----------|
| DMTEND1A .....         | 131      |
| DMTEND1B .....         | 131      |
| DRAM interface .....   | 208, 222 |
| DTC vector table ..... | 485      |
| Dual address mode..... | 423      |

## E

|   |          |
|---|----------|
| Effective address extension .....                                     | 72       |
| Ending DMA transfer .....   | 468      |
| ERI0.....   | 945      |
| ERI1.....   | 132      |
| ERI2.....   | 132      |
| ERI3.....   | 132      |
| ERI4.....   | 132      |
| Exception handling .....  | 95       |
| Exception handling vector table .....                                 | 96       |
| EXDMA controller (EXDMAC) .....                                       | 407      |
| EXDMTEND2.....  | 131      |
| EXDMTEND3.....  | 131      |
| Extended register (EXR) .....   | 56       |
| Extension of chip select ( $\overline{CS}$ )<br>assertion period..... | 207, 220 |
| External request mode .....   | 427      |

## F

|                       |      |
|-----------------------|------|
| Flash memory .....    | 1079 |
| Framing error.....    | 907  |
| Full-scale error..... | 1018 |

## G

|                           |     |
|---------------------------|-----|
| General call address..... | 969 |
| General registers.....    | 55  |

## I

|  |      |
|--|------|
| I/O port states in each processing state . | 1339 |
|--|------|

|   |          |
|---|----------|
| I/O ports .....                                   | 507      |
| I <sup>2</sup> C bus format.....                  | 971      |
| I <sup>2</sup> C bus interface (IIC).....         | 955      |
| Idle cycle.....                                   | 284      |
| Idle mode .....                                   | 353      |
| IIC10.....  | 133, 134 |
| IIC11 .....                                       | 133, 134 |
| Immediate .....                                   | 76       |
| Input capture function.....                       | 755      |
| Input pull-up MOS.....                            | 507      |
| Instruction set.....                              | 62       |
| Interrupt control modes.....                      | 136      |
| Interrupt exception handling .....                | 102      |
| Interrupt exception handling<br>vector table..... | 129      |
| Interrupt mask bit.....                           | 57       |
| interrupt mask level .....                        | 56       |
| Interrupt priority register (IPR).....            | 107      |
| Interrupt sources .....                           | 400      |
| Interval timer mode.....                          | 860      |
| IrDA operation.....                               | 940      |
| IRQ0 .....  | 129      |

## L

|                                    |      |
|------------------------------------|------|
| List of registers .....            | 1165 |
| Logic operations instructions..... | 67   |

## M

|  |     |
|--|-----|
| Mark state .....                         | 948 |
| MCU operating modes.....                 | 83  |
| Memory indirect .....                    | 77  |
| Multi-channel operation.....             | 394 |
| Multiply-accumulate register (MAC) ..... | 58  |

## N

|                    |     |
|--------------------|-----|
| NMI .....          | 146 |
| NMI interrupt..... | 127 |

|                                    |                  |
|------------------------------------|------------------|
| Nonlinearity error .....           | 1018             |
| Non-overlapping pulse output ..... | 819              |
| Normal mode .....                  | 49, 50, 363, 492 |
| Normal transfer mode .....         | 430              |

## O

|                                   |      |
|-----------------------------------|------|
| Offset error .....                | 1018 |
| On-board programming .....        | 1086 |
| On-board programming mode .....   | 1086 |
| Open-drain control register ..... | 507  |
| Operation field .....             | 72   |
| Output trigger .....              | 812  |
| Overflow .....                    | 858  |
| Overrun error .....               | 907  |
| OVI .....                         | 845  |
| OVI0 .....                        | 131  |
| OVI1 .....                        | 131  |

## P

|  |          |
|--|----------|
| Package dimensions .....               | 1358     |
| Parity error .....                     | 907      |
| Phase counting mode .....              | 771      |
| PLL circuit .....                      | 1140     |
| Port function control register 2 ..... | 695      |
| Port register .....                    | 507      |
| Product code lineup .....              | 12       |
| Program counter (PC) .....             | 56       |
| Program-counter relative .....         | 76       |
| Programmable pulse generator .....     | 803      |
| Programmer mode .....                  | 1132     |
| Pull-up MOS control register .....     | 507      |
| Pulse output .....                     | 838, 839 |
| PWM modes .....                        | 765      |

## Q

|                          |      |
|--------------------------|------|
| Quantization error ..... | 1018 |
|--------------------------|------|

## R

|  |               |
|--|---------------|
| RAM .....                                    | 1077          |
| Read strobe ( $\overline{RD}$ ) timing ..... | 205, 219, 220 |
| Register addresses .....                     | 1166          |
| Register bits .....                          | 1181          |
| Register direct .....                        | 74            |
| Register Field .....                         | 72            |
| Register indirect .....                      | 74            |
| Register indirect with displacement .....    | 75            |
| Register indirect with post-increment .....  | 75            |
| Register indirect with pre-decrement .....   | 75            |
| Register information .....                   | 485           |
| Register states in each operating mode ..... | 1201          |
| Registers                                    |               |
| ABWCR .....                                  | 156           |
| ADCSR .....                                  | 999           |
| ASTCR .....                                  | 156           |
| BCR .....                                    | 168           |
| BROMCR .....                                 | 167           |
| BRR .....                                    | 889           |
| CRA .....                                    | 480           |
| CRB .....                                    | 480           |
| CSACR .....                                  | 165           |
| DACR .....                                   | 1030          |
| DADR .....                                   | 1030          |
| DAR .....                                    | 480           |
